FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JANUARY 31, 1884.

VOL. XXII.—No. 1. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

AN ADIRONDACK BILL.

A BILL for the preservation of the Adirondack forests was introduced on Tuesday in the New York Legislature. This bill, which is said to have been drawn up by the Chamber of Commerce Committee, provides for a commission to inquire into the ownership of Adirondack lands, and authorize the appropriation by the Legislature of $500,000, for the purpose of acquiring these lands for the State, and adding them to those already owned by it. The whole is to form an Adirondack Reservation. The purpose of the bill is the protection and increase of the water supply of the Hudson and Mohawk rivers, and their tributaries, and of the Erie and Black River canals. The lands to be selected lie in the counties of Clinton, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Oneida, Saratoga, St. Lawrence and Warren.

The work of selecting these lands and protecting them after they shall have been acquired by the State is to be placed in the hands of three individuals, to be known as the Commissioners of the Adirondack Reservation. These officials are to be appointed by the Governor and the Senate, and are to serve for two, four and six years, respectively. They are authorized to care for and improve the lands, forests and waters under their control, and to appoint forest wardens to carry out this improvement, and to bring suits against trespassers on the State lands. In fact, the bill provides for a forestry commission modeled after some of those of Europe recently alluded to in FOREST AND STREAM.

It is to be observed, however, that only about one-half of the Adirondack region is provided for in the bill, the watershed only of those rivers flowing south being protected, while those which flow north are passed over. No doubt the increase of the water supply of the Hudson, the Mohawk, and the Black rivers is most important, and it is perhaps wise to begin the work in a small way, selecting that portion of the region in which the benefit of forest protection will be most speedily felt.

A most bitter opposition to the bill may be expected from the lumbering interest, which is unwilling that the forests should be protected until they shall have been entirely cut off. Still, so great is the public interest aroused by the recent discussion of this subject, that the friends of forest protection have strong hopes that the present bill may become a law.

It is only a short time since a large proportion of the public appeared to think that forests were useful only as supplying lumber and firewood, but this ignorance has now been replaced in many minds by a much more intelligent comprehension of the value of our woodlands.

Those who have carefully read what we have recently had to say upon this subject, cannot have failed to comprehend the immeasurable importance of our forest lands to every class of people. It is the duty of every man to use what influence he can to protect these forests.

ANGLING SLANG.

OUR attention has been called to this matter by an editorial note in the London *Fishing Gazette*, which complains of a want of originality in writers who use the terms "spotted beauty" for trout, "finny tribe" for fish, and "rodster" for angler, and says that these terms cause worse language on the part of readers and a frequent use of the editorial waste basket.

We have noticed a growing tendency to this evil habit in America, and our pen is often drawn through the obnoxious words and the correct ones substituted. If any correspondent, in giving an account of our fishing to some local paper, should call us a "rodster," he would forfeit our good opinion forever. We do not know who coined this vile term, nor why, having been coined, others allow its use. Worse than this, if possible, is the phrase "chucking a bug," for casting or throwing a fly. To speak of a gentleman as a "bug chucker" may appear to some to be the very essence of wit, while to others it seems a coarse vulgarity.

Even if these things were wit in the originator, they have become offensively stale by repetition, and no writer, who has any wish to appear original, will use them. "Disciples of Walton" is another hackneyed term. It is not as offensive as the disgusting "rodster" and "bug chucker," which none but the coarsest natures indulge in, but it has been in use to describe anglers so long that it is at least threadbare and has ceased to be an improvement on the word which it supplants.

Slang may occasionally be effective in tersely describing in a word what otherwise would take a sentence, but it is usually a very transient thing, and stale slang has not only lost its savor, but the dose is nauseating.

NO MONEY FOR REVOLUTIONS.

CAPTAIN LUNDBORG, attached to the Swedish Legation in Washington, is before Congress as a petitioner for national alms. Captain Lundborg has been for several years hawking about a "revolution" in naval architecture, and failing to receive any encouragement from private sources, now seeks to float his scheme at the expense of the nation.

This scheme consists in so altering the present forms of vessels that the "water shall be parted upward" instead of horizontally, the worthy Captain being under the impression that he has made a discovery which will result in materially diminishing the resistance of ships to passage through the sea. It is almost needless to say that the scheme is very ancient, equally as chimerical, and only the superficial conception of an amateur at the business. No vessel, whatever her form, can part the water in any other direction than upward. The plumb sides of a steamer of usual shape impart their pressure laterally, it is true, but that pressure, by well-known physical characteristics of water, is instantaneously transmitted in all directions, and finds relief in the direction of least pressure, which is upward, as demonstrated in practice by the creation of bow waves. To construct a vessel of special form to accomplish what every vessel already accomplishes, is the wonderful piece of crude engineering, for which Congress is asked to vote money to the material gain of Captain Lundborg in particular. His proposed variation upon ordinary forms involves a swell in the bilge with a fore and aft section resembling a cigar. A structure of the kind would cost a great deal more and be far heavier than the simpler forms in existance. It would call for greater driving power, and could not compete in point of economy with steamships now afloat. Its qualities at sea are likewise very much open to question.

The whole scheme is silly, and can fittingly be classed with the Voorhees steam catamaran, the notorious Meteor, the "globe" steamer, the Keely motor and similar humbugs of the day. Had Mr. Lundborg's vagary the slightest merit or had it received the indorsement of competent naval architects and engineers in place of the sympathy of a few old-fashioned Admirals not versed in marine engineering, there would not be any difficulty in attracting the attention of private capital in these times when money goes begging. If the petition recently introduced by General Rosecrans is not smothered in committee it is to be hoped Congress will, by a large negative vote, promptly choke off this attempt to experiment at the expense of the national income, or else a flood of quacks will pour in from all quarters with similar fantastical ventures. Why should Captain Lundborg, an alien, receive aid for his nonsense any more than any other of the million of more deserving inventors who are, at least, citizens of the country? His appeal to Congress is preposterous.

THE "FLICKERING" VOTES.

THE polls will close to-morrow. All votes received then will be counted, whatever may come in Saturday will be just one day too late. The limit of time was made that our British Columbia subscribers might have opportunity to be represented, and their votes reached us last Monday. Others had previously come in from Mexico, Cuba, Bermuda, England, Scotland, Ireland and Germany. Total number of ballots received up to date (Wednesday, Jan. 30) 1929, not including a number of anonymous cards which have not been counted. The winning stories will be announced in our next issue, and the winning voters, if they can be determined by that time, but it is probable that they will not be decided before the week following.

IN CERTAIN LOCALITIES along the Atlantic coast the fowl shooting during the month of January has been remarkably good. Earlier in the season, indeed during the whole of November and December, the weather was so mild and pleasant that, although the birds were present on the feeding grounds in great numbers, they did not afford any good shooting. We have recently learned, however, of the score of two gentlemen, who have been shooting on the grounds of the Narrows Island, in Currituck county, N. C., which is remarkable. During a month spent at the club house they killed 10 swans, 104 geese, 194 canvas-backs, 27 redheads, 469 common ducks (teal, widgeon, black ducks, mallards, etc.), 9 quail and 51 English snipe. Taking out Sundays, stormy and other days, when no shooting was done, it will be seen that this makes a very high average for the month. The grounds over which this shooting was done are among the best for fowl on the Atlantic coast, and, in these days of game scarcity, it is satisfactory to know of one locality where it is still abundant. With proper attention to preservation, and with the abolition of battery shooting, the members of the clubs situated along Currituck Sound should have good shooting for all time.

THE CARTED STAG AGAIN.—Last week we referred to the importation of the English carted stag hunts, and mentioned that such a hunt had been held in Missouri. In another column will be found some account of a similar disgraceful occurrence near Cleveland, O. Now Cleveland is fortunate in possessing, among her older citizens, some of the best sportsmen of this country, men who are a credit and honor to the company of those who handle rod and gun. We can imagine the disgust they must feel at such a travesty of deer hunting as that at Newburgh the other day.

DOG CLUBS.—As may be learned from our kennel columns the proposed beagle club is on a fair way to successful organization. We count the formation of special clubs of this kind a promising indication of the growth of intelligent interest in the several breeds. The new beagle club ought to have a membership of five hundred.

NEW GAME LAWS.—We hope that our readers in the several States will take pains to inform us of any changes that may be made in the game laws this winter. One way to insure the good effect of such laws is to give them the widest possible currency, and such an effectual publicity is secured by printing them in this journal.

THE MASSACHUSETTS DOG LAWS are the subject of an instructive paper printed in another column. We commend a perusal of it to the individuals who propose to make the old Bay State ridiculous by enacting the dog-bond provision already adverted to in our columns.

THE CLAY-PIGEON TOURNAMENT.—Several news notes relating to the Chicago clay-pigeon tournament have been necessarily postponed to our next issue.

FOREST WEALTH.

IN a recent article on Forest Schools in Europe we alluded to the great loss just ahead of us because of our reckless waste of the woods with which the white man found this country so richly endowed.

That loss was stated as likely to reach the bewildering total of a billion dollars a year, that can be estimated and measured with some degree of certainty; besides a vast amount of incidental damage through the crippling of the industries dependent upon wood, and especially the white pine, for their material; through climatic change, and through diminished water supply for the needs of cities, for agriculture, and for transportation.

Just a few figures to show that this is not wild guessing. Mr. James Little, of Montreal, who is no doubt one of the most painstaking and well-informed statisticians upon this subject, gives the value of the lumber produced in the United States, "as it falls from the saw," for 1882 as not less than three hundred millions of dollars. Of this inconceivable total, white pine is the principal factor. We have almost reached the end of our supply of that wood. At our present rate of consumption not more than seven years hence we shall see the last of it. Prof. Sargent, curator of the Arnold Arboretum, connected with the Bussey Institution of Agriculture belonging to Harvard University, is also the special forest statistician of the U. S. Census Bureau. He reported in 1882 to the Massachusetts Board of Agriculture that only eighty billion feet of white pine remained at that time in the United States, and this total included much small and poor timber. He said that the average annual consumption was then ten billion feet, and the cut for the year next after his estimate was the largest ever made. Nearly two out of the eight years' supply which remained when Prof. Sargent made this terrible revelation have already gone. That statement was the cause which doubled, and in some cases more than doubled, the price of standing white pine. In favorable locations it is now held at two hundred dollars an acre and often more.

Mr. Little further assures us that the Dominion of Canada, except for her supply upon the Pacific coast, is almost as badly off as we are. Her stores, which were thoughtlessly spoken of as exhaustless, are not so. From earliest times men have been so impressed with the magnitude of great forests that they have called them inexhaustible. But not even tropical abundance and reproductive power could supply the awfully expeditious, and awfully wasteful modern methods of lumbering with material for any great time.

The pine of the Pacific coast, though, no doubt, rich and abundant, will be very expensive by the time it is brought to the markets which the forests of Minnesota, Wisconsin, Michigan and Canada have been supplying. Besides it will be found a far from limitless store if attacked as the woods of the East have been.

But to return to our figures: $300,000,000 at the sawmills and $450,000,000 at the places of consumption was the value when Mr. Little made his estimates. To replace it from other lands (if they could spare it, which they could not) would cost two or three times more, and would require more than all the tonnage of seagoing vessels in the world to transport it. Here, then, is a commodity which will soon be gone, and when gone would cost not less than a billion dollars a year to replace if it could be had.

Since we cannot replace it from abroad, what shall be done? Passing by with a mere mention the obvious expedient of using as many substitutes as possible for white pine in buildings—and if non-combustible materials like iron, stone, brick, etc., are used, the saving in insurance will be immense—we come to the matter of economy in cutting and marketing.

Pine lumbering, as at present carried on, is a terribly wasteful business. Experts say that on an average fifty small trees are sacrificed in getting out one large one. Tops and brush are left where they become resinous tinder heaps in a dry time, and any spark may start a conflagration that no man can stop. Campers, hunters and anglers often start fires through carelessness. Every reader of FOREST AND STREAM who goes into the woods should appoint himself a committee of one to impress upon the thoughtless the duty of taking care not to start fires. And the public ought to protest against leaving brush as lumbermen generally do leave it. Forest fires often cost awful waste of life, such as all can remember to have occurred in Wisconsin and Michigan within a few years.

But after all, the great dependence must be upon reproduction. This is not by any means impracticable. Almost always, if fires and cattle and other browsing animals are kept off land which has once been covered with white pine, it will soon seed itself. Sowing is not a complicated matter if the young shoots do not appear thick enough. Then trim up and thin out, as the case demands, and in fifty years there will be from 100,000 to 150,000 feet of lumber to the acre; and the material taken out in the interval will, in many cases, perhaps in most, pay taxes, interest and cost of labor.

In 1800, a tract of land in New Hampshire, which had been burned and cleared, was allowed to seed itself with white and Norway pines. Hon. Levi Bartlett became owner in 1825. He thinned two acres, taking off over half the smallest trees, which he reported much more than paid, as fuel, for the labor of this thinning. Twenty-five years later, a careful estimate showed that the land which had been thinned was worth at least one-third more than that which had been let alone. "He thought that had the land been judiciously thinned yearly, enough would have been obtained to have paid the taxes and interest on the purchase, above the cost of cutting and drawing out, besides bringing the whole tract up to the value of the two acres which had been thinned out." At the end of twenty-five years from the seed the larger trees were from forty to fifty feet high, eight inches on the stump, and furnished timber which could be hewed for rafters. "After the next twenty-five years (fifty from the seed) he * * estimated that the trees left on the two acres would average six to eight feet apart. They were mostly Norway pine, ten to twenty inches in diameter, and eighty to 100 feet high. He was greatly surprised seven or eight years after this to see the increase of growth, especially in the two acres thinned thirty years before. The owner had done nothing, except occasionally cutting a few dead trees." That which had been thinned was now worth twice as much as that which had not been. There was not twice as much wood, but owing to the greater size and length of the trees, they were worth twice as much at the mill. "There were hundreds of Norway and white pines that could be hewn or sawed into square timber from forty to fifty feet in length." "On the part left to Nature's thinning there was a vastly greater number of dead trees—many of them fallen, and nearly worthless." (Hough's Report to Department of Agriculture 1877, pp. 400 and 401.) It was estimated that at this time the land would yield 150,000 feet of lumber to the acre.

At the enhanced price which, twenty-five years from now, white pine will surely bring it is easy to see that there is money in these two things; cutting only the large, and in every way saving the small trees; and in planting, protecting from fire and cattle, and thinning wherever white pine will thrive. In another article we may speak of methods of propagating and cultivating other trees which will mature more quickly, and furnish for many uses an acceptable substitute for the white pine.

The Sportsman Tourist.

AN OREGON EPISODE.

IN WHICH IT IS RELATED HOW KIT JACKSON'S MULE WAS SURE.

"LOOK, boys, quick, thar goes one of the Big Sandy cattle as sure as Kit Jackson's mule."

Three men sprang to their feet from a prostrate log, where they had been sitting, and gazed eagerly in the direction indicated by the speaker; just in time to catch a glimpse of a large animal, evidently of the bovine species, as it disappeared in a thicket of tall salmon berry bushes about two hundred yards distant.

The time was early morning in the latter part of September. The place was a large "burn" between the Big and Little Sandy, two small streams that spring from sources on or very near Mount Hood and flow in a northwesterly direction until they reach the Columbia. The men were four hunters, who, with four pack animals, had been hunting in the vicinity for nearly a week, and whom I will briefly introduce to the reader. Wilson, the speaker above mentioned, was a tall, spare man, between forty and fifty, who owned a small clearing on the great trail from Eastern to Western Oregon that skirted the base of Mount Hood as it passed through the Cascade range. Here he had built a small log cabin, where his wife and several children resided, and where Wilson himself, who did a very small amount of farming—and no end of hunting and trapping—put up when he was out of the mountains. His dress was a nondescript affair of buckskin and butternut, and his rifle a long octagon-barrel muzzleloader, with a buck-horn sight, such as was almost invariably seen in the hands of the old line of Western hunters and trappers twenty years ago. Two of the remaining three were brothers, named Charles and Ben Doyle, who were several years younger than Wilson, and owned a farm together a few miles from the location made by the latter. The last of the party was the writer, who had drifted up into that remote quarter from San Francisco on purpose to have a good hunt, and a surfeit of venison.

Before going further it may not be out of place to describe the nature of a "burn" for the benefit of those unacquainted with the terms used in the far West. The immense forests of pine, spruce, hemlock and fir that cover the western slopes of the mountain ranges from Mendecino county, Cal., to Alaska are subject almost every year to devastating fires that destroy sometimes in one year more timber than all the sawmills that are scattered through that country have consumed since its first settlement by the whites. These tracts, which are frequently many miles in extent, are called "burns." All, or nearly all, of the trees will be killed, many of them entirely consumed, others are burned so badly at the base that they are overthrown by the winter gales, and the remainder, stripped of bark and foliage and bleached by sunshine and storm, present anything but an inviting picture to the lovers of the beautiful in nature.

These "burns," however, are the favorite resorts of almost every species of game found in the country. After the fire comes a rank growth of wild pea vine, salmon and salal brush. Then come the deer, who feed greedily upon the pea vine, while bear and grouse grow fat upon the salmon and salal berries, especially the latter, which are frequently found in such profusion that they can be stripped off by the handful, and as they much resemble a large huckleberry in size, color and taste, are not to be despised by the hunter himself.

With this explanatory digression, I return to my camp-fire on the Sandy. I use the word "camp-fire" advisedly, for that was about all there was to indicate the place where we had located, unless it was the four horses tied to the bushes near by where the pea vine was thickest. The certainty of fine weather in this season and latitude obviated the necessity of a shelter of any kind, and therefore we had none. Four beds made by layers of pea vine a foot deep and covered with blankets occupied the space on one side of the fire, and a small Dutch oven, an old tin coffee pot, with a few cups of the same material, and a sack of self-raising flour, comprising the entire kitchen outfit, were scattered about on the other. The limb of a fallen tree, conveniently located, furnished us with comfortable seats when we were not lounging upon the blankets, and also a rest for our rifles and extra clothing. Just beyond the kitchen utensils the saddles of eight or nine deer wrapped in the hides and tied ready for packing were piled together—for we were making arrangements to leave the burn that day—while a large buck, upon whose sides the clear fat was at least half an inch thick, and which had for that reason been selected for our special delectation, was suspended just clear of the ground from another limb of the fallen pine. Over beds of coals drawn out on each side of the fire, and transfixed upon forked sticks, with one end stuck into the ground or beneath a stone, hung several ribs of the above mentioned buck, the rich fat slowly dripping on to the coats, and sending up to our nostrils those delicious, appetizing clouds, whose flavor lingers with me still.

It was thus we were situated, and thus we were engaged, when Wilson with a pone of bread in one hand and a half-picked rib in the other arose from his seat, and after scanning the brush as far as he could see with the instinct of a true hunter, brought us all to our feet by the remark with which I have headed this chapter. To the Doyle brothers there did not seem to be anything very mysterious about the affair, but the writer, who had only been upon the upper coast three or four weeks, was as profoundly ignorant of exactly what was meant by the "Big Sandy cattle," as he was of the certainty of Kit Jackson's mule.

"How many of them are left now, Wilson?" said Charley Doyle, after we had become satisfied there were no more cattle in sight, and resuming our seats, had attacked the spare ribs with renewed vigor.

"Only three or four. Miller killed one early last spring, and saw one heifer and two steers besides, but as there were at least seven when they were first seen and only three are killed, I think there are four yet," was the reply.

Upon inquiry I found that the cattle were some that had been lost from a herd that a drover had attempted to drive across the mountains nearly two years before, and being overtaken by a severe storm, the whole herd had stampeded into the timber and many of them were never recovered, but having broken up into small bands and drifted off miles away from the road, had become much wilder than were the deer in that vicinity.

"I think we'd better give them fellers a whirl before we dust out of this," said Wilson, sending a denuded rib spinning over the brush, and taking a fresh one from the fire. This suggestion seemed to meet with the approval of all parties, the novelty of the thing being of itself sufficient to enlist my hearty co-operation. So it was agreed to postpone our departure another day, in order to give the wild cattle "a whirl." Accordingly after breakfast was finished we rolled up the blankets, tied the horses to fresh feed, and shouldering our rifles struck out toward the narrow bottom of the Big Sandy, where the animals had disappeared. So thick was the fallen timber that our progress on foot through the burn was exceedingly slow, and going on horseback was entirely out of the question, for it had been with the greatest difficulty that we had succeeded in getting our horses into the place selected for our camp, although the intelligent brutes, who had all been raised in the mountains, never failed to attempt to surmount any obstacle that we led them up to by the bridle. Upon reaching the edge of the bottom it became evident that our only chance of success lay in separating into two parties, one to go to the upper end of the bottom and lie in wait at the passes, while the other beat up from below. Wilson and I therefore slowly moved up the edge of the bottom, while the Doyles went for the lower end.

Reaching our destination we sat down on a log to wait, and knowing it would be some time before the boys below us would be in a position to need our assistance, I thought it a favorable opportunity to learn something of the history of my companion, which I had reasons to believe had been rather an eventful one, as he had been many years in the State, and was a volunteer scout all through the long and bloody struggle of the settlers with the Rogue River Indians. With most men who have spent many years hunting and trapping, especially in those portions of the country infested with hostile Indians, silence becomes a second nature, the necessity of caution, the dearth of any great variety of subjects to excite conversation, and the very limited number of their companions, all tend to promote this reserve until it becomes habitual, and as Wilson was no exception to the rule, my efforts to draw him out were only partially successful such as they were, however, I give in substance without any attempt at a literal rendition.

"Wilson," said I, as a leader, "were the Rogue River Indians a cowardly pack of ragmuffins like the Diggers, or did they more nearly resemble the Sioux, Cheyennes and other warlike tribes of the buffalo country?"

"They were the bravest tribe of reds I ever saw, and were themselves so confident that they were nearly our equals man for man, that Capt. John, their war chief, offered to select a given number of men and fight a pitched battle with an equal number of whites, the result of which should decide who should possess the land. Scores of the settlers were eager enough to accept the challenge, but of coure no one had any authority for such a proceeding."

"Did you have any hand to hand encounters with them?"

"We had many of what might be called rifle duels, but the country was so rugged and so heavily timbered that those were usually conducted at very short range, and as the abundance of game there had made excellent marksmen of both sides, they were almost always very short and deadly. On one occasion two of us were scouting in the neutral ground, and after a long and fatiguing march had stopped to rest by the side of a trail. Being still far from the Indian encampment we did not consider the neighborhood very dangerous, and had taken no special precautions although we were far from being noisy, when a slight rustling off in the narrow trail ahead of us put us both on the alert. We had barely time to cock our rifles when the Indians, evidently scouts like ourselves, appeared in full view walking one behind the other, and only a few yards from us. Quick as a flash it occurred to me that my pardner would be likely to take the one in front and without a moment's hesitation I fired at the other. Our rifles cracked as one report, and both Indians dropped dead in their tracks."

I had become so interested in Wilson's narrative, albeit it was only drawn out by persistent questioning, that I almost forgot what we were there for. The chivalrous conduct of Chief John, who must not be confounded with Capt. Jack, the Modoc chief, who flourished at least two decades later, was so different from that of most of the various tribes with whom I had been personally acquainted, that it reminded me more of the Sultan Saladin than it did of the

copper-colored friends I had known, and I was about to follow up the pumping operation still further when the crack of a rifle, followed instantly by a loud shout from one of the Doyles, brought both of us at once to our feet. From our position we could see by the swaying brush that the brute had been started and was coming toward us as rapidly as the nature of the thicket would permit. Stepping a few yards apart, in order to command as much of the front as possible, we cocked our rifles and awaited the result. Nearer and nearer he came, the loud cracking of the brush accurately marking his advance, until the brushes parted in front of Wilson, who stood in plain sight in the knee-high salal, and a long-legged, gaunt, red and white steer of the genuine Texan stamp came into full view almost at a bound. We had arranged it thus with the expectation that as soon as he saw us in front he would attempt to turn and re-enter the thicket, giving us a chance at him behind the shoulder as he turned, and driving him back toward the Doyles should we fail. This would probably have been the result had he not been so desperately wounded, but with the blood dripping from his mouth, if he had any intention of showing the white feather it was not visible, for with accelerated speed he charged straight for Wilson, who coolly stood with his rifle to his cheek near the log upon which we had been sitting.

Unable longer to stand the tension upon my nerves, I fired quartering at the steer's head, but unfortunately just as he dropped it for the assault. The .44-caliber bullet struck the far horn squarely near the base, shattering it in pieces, and the next instant, either dazed by the shock or choked by blood from the bullet of Doyle, which had evidently pierced his lungs, he stumbled and came down upon his knees, only a few feet from Wilson, who sent his bullet through his brain before he could recover himself. We were surprised to find him in such poor condition, considering the great abundance of feed around us, until we found an old bullet wound in his lower jaw that had carried away several teeth which must have seriously interfered with his eating, and rendered it a matter of much doubt whether he would have been able to survive the following winter.

"That ere feller had a leetle idee of showing fight," said Wilson, as he drew several bullets from his pocket, and after carefully selecting one placed it in the palm of his hand, and from his horn poured out sufficient powder to just cover it, which was his method of measuring a charge, then putting a strip of buckskin over the muzzle he placed the ball on top and forced it down until it was level with the end of the barrel, after which he trimmed off the surplus buckskin with his sheath knife, and sent the lead home with the hickory ramrod.

We were soon joined by the Doyles, and learned that the old Texan had been lying in a little opening overgrown with rushes, probably the bottom of what was a pond in the rainy season. Ben had heard him as he jumped and started to run, but was unable to see him while Charley, who was a little in advance and at some distance to the right, caught a glimpse of him just as he reached the edge of the surrounding thicket and fired with the result above stated. We were unable to find any fresh traces of the remainder of the band, but as we found the encampment of a party of straggling Indian hunter, that did not appear to have been deserted more than a week, it is possible they may have been able to have given some information upon the subject. After skinning the animal we slung between two poles the hide and such portions of the meat as we wanted and returned to camp. It was still early in the day, but as we expected to leave the burn in the morning, and already had as much meat as we could easily pack out, we concluded to do no more hunting but to devote the remainder of our time to mending our clothes and lounging by the camp-fire, where more or less cooking was going on nearly all the time.

Our trip had indeed been a very satisfactory one, for although we had only hunted a little while in the morning and evening of each day, we had killed eleven deer and one black bear—grizzlies are not found in that section of Oregon—besides as many blue grouse as we cared to shoot, which was not many, as we took no notice of them, unless close to camp, and we had a chance to make a fancy shot at their heads. The only real temptation I had from them was one morning while passing around the butt of a fallen tree I saw a number of them sitting on the other end, and could easily have killed three with a single shot from my rifle, but as they would have hardly been worth picking up after being shot through the body with so large a bullet I passed them by. Black bears were plenty enough, but as nobody would eat bear meat at our camp so long as fat bucks could be obtained, that incentive, at least, was wanting in the chase.

Late in the afternoon, after completing as far as possible our arrangements for departure the next day, my idle thoughts reverted to the old Texan and the first sight we had of him; and turning to my companion of the morning, I said, "Wilson, how sure was Kit Jackson's mule?" "Well," said that worthy, who was busily engaged sewing a rip in his bootleg with a buckskin whang, "according to Kit himself there wasn't anything he warn't sure of doing that he started in on. He allowed that mule could out-pull, out-kick or out-buck anything that went on four legs and wore hair, and as far as I ever heerd on Kit was about right; but where he got the name of being so *dead* sure was one day when Kit came to the village, and after taking in a big load of bug juice, began, as he allers did, to brag on his mule, and tell how far he throwed a feller that tried to ride him. 'I tell you what,' said Kit, as he stood at the bar setting 'em up for the boys, 'ennybody but me that thinks he can ride that mule is a dern fool, for he is going to get throwed sure pop.' Now, there happened to be a chap from the cow counties in there that day, who called himself a buckarer (vaquero), and he allowed the mule might throw 'em some pops, but when Jackson or ennybody else talked about its being sure pop, he was ready to chip in, as he calkelated he could ride ennything that ever wore a saddle. Some words passed between him and Kit, and he bet the drinks for the crowd that he could ride the mule. This offer suited everybody there, and they all took a hand in fixing up the thing, because, you see, they all had an interest in it.

"Kit trotted out his mule and pretty soon out came the feller with a Spanish saddle with two hair sinches and a crupper, got up on purpose for the occasion. Now that ere mule knew thar was suthin' uncommon going on, the minute that chap began to draw up on them two sinches, so he began to swell up just like a big toad. But it was no use, Dunk, that's what they called the feller, had been there before, and he drawed up first on one latigo and then on the other till the mule couldn't stand it no longer, so he jest looked 'round once with a wicked twinkle in his eye and let go his breath till the sinches were up to the last notch. Well, he got on, and for about five minutes there was some of the tallest buckin' ever seen in them parts. The mule dropped his head between his knees, roached his back; and some of his stiff-legged jumps, they said, measured ten feet. He fetched the blood out of Dunk's nose and mouth, but he couldn't fetch Dunk. Then he opened up on a new deal and tried to fall over backwards on Dunk and smash him, but that didn't work either, for when he was just balanced and going to fall, Dunk would slip his right foot out of the stirrup and step onto the ground and let him come down; then as soon as the mule got on his feet again, he found Dunk on his back with the rowels of his big spurs hooked into the sinches.

"Then he made for the trees along the sidewalk and tried to scrape Dunk off by running under the low limbs and against the trunk at the same time. No go. Dunk seemed to ride just as well with his toes hooked round the cantle of the saddle and his body down by the mule's knee as he did anywhere.

"The boys had been betting on the mule all the time, but they begun to hedge now. Things begun to look a little streaky for Kit, when all at once the mule made a break for the river. What he was going to do there nobody could guess. In he went and started as if to swim across just below the bridge, but when he got right over the deepest place down he went, mule, rider and all, plump out of sight, like a porpoise. Then the boys got scared and made a break for the bridge as fast as they could hook it. Looking over the rail down into the deep water, there they saw old Jeff on the bottom hanging on to a big root with his teeth, and Dunk on his back a clappin' the spurs into his ribs and jerkin' on the bridle, trying to raise him to the top. When Kit's backers seen that they got fast again to bet on the mule, for you see they allowed that as old Jeff knew what he was going to do, he'd fill up his bellusses before he went down and so had the bulge on Dunk; but the rest thought that Dunk had dropped on it time enough to get in a square breath; and even if he didn't the mule was sinched so tight he couldn't hold much wind nohow.

"Pretty soon, though, they seen Dunk look up, then he let go of the saddle and made for the top. He didn't say nothing when he got up, but jest took a good long breath and went down again, but he was a leetle too late, for jest as soon as he let go the bridle, Jeff slid out from under him and started for shore with his head and neck stretched out like a loon after shiners. 'Twas no use for Dunk to try to ketch him then; it couldn't be did, so he paddled for shore too. When Dunk had crawled up the bank and shook himself, he cum up to Kit and said, 'Mr. Jackson, I was wrong; and I ask your pardon. When that are mule starts in to do anything, he's going to do it, sure pop. Boys, less all go up and take suthin.'"

"Had that account been properly sworn to before a justice when you heard it?" said I, when Wilson had finished his bootleg and his yarn at the same time.

"Well, I can't say as to that. The crowd that put in their spare time at the Bullwhackers' Retreat, didn't fool away much spare cash on legal dockyments, leastwise during saloon hours; but that's how the boys cum to swear by Kit Jackson's mule." FORKED DEER.

SAN FRANCISCO, Jan. 7, 1884.

BETWEEN THE LAKES.

Second Paper.

THE CAMPING GROUND FOUND.

WHEN an Indian skipper, Captain Kishkatog, and his able and his ugly mate, Dan Sky, sailed away and left us at our camp on the Ahmeek-we-se-pe, it was with the knowledge on our part that we were nineteen miles from the nearest point to which we could look for relief in any contingency. We were in an unhacked wilderness—a wilderness in which men had been lost and never found. It is true that steamers were not infrequently seen from three miles out to as far as one could see, but for all the relief any steamer would or even could bring to us, it might as well be on the broad Atlantic. When our man left us, he left us alone; left us beyond the reach of wearying clients and vexing students, and book and insurance agents and lightning-rod and tree peddlers, with no sounds to hear beyond the circle of our own voices, save the sounds that came from out the woods and from off the waters.

Were we happy at being thus left? Was not this the fulfilment of the dream of each one of us ere we left home? Yes, but I dare say not one of us but nursed an uneasy feeling, as he watched the Indian's boat dancing away on the bosom of the broad waters. What if something should happen? What if one of our number should get hurt, or become sick or get drowned? These and like questions our thoughtful wives had propounded before we left home, and with a courage born of a then state of safety we had answered lightly, as became truly brave men; but now, when we stood alone in the wilderness, the anxious faces of our dear wives looked out from the little cloud of mist that overhung the Ahmeek-we-se-pe, and we thought of the questions they had once asked, but our courage was gone. The questions were unanswered.

Away with forebodings! Let us look around! Here upon this sand bluff, sixty feet above the lake's level, in the edge of a little grove of Norway pines, whose straight and tall and slender boles ceaselessly wave to and fro in the breeze, our white tent lifts its humble comb and is to be our roof-tree the coming three weeks. The view lakeward in storm or calm will never fail to please. Ah! The gorgeous sunsets we will see, and the tempests of rain and thunder that will drive over the bosom of the waters! Four miles westward a great rock promontory, three hundred feet high and a thousand feet long, and crowned with a forest of evergreen trees—the Grand Portal of the Pictured Rocks—gleams in the early morning sunshine like a great wedge of gold. At the foot of our sand bluff the Ahmeek-we-se-pe, flowing from beneath a drift of stranded trees, races over the bar down to the lake and leaves a long rippling trail in its waters. Beyond the belt of Norways, to the south, is the "deep, tangled wild woods," through which a footpath winds half a mile, ending at the shore of the Ahmeek-sah-kah-e-gan, the Beaver Lake of the Ojibwas. This lake, a mile in width and two in length, with its longer axis parallel with the great lake shore, is surrounded by an unbroken fringe of green woods—woods as green and impenetrable as on that day two hundred and forty-two years ago, Father Alloüz first sailed the south shore of the great lake. A lovelier sheet of water is not to be found in all this region of lovely lakes. Next the shore the water is shoal all the way around, but as it recedes, it becomes gradually deeper until at a distance varying from fifty to one hundred yards from the shore it suddenly drops down into a deep basin; and lying close in against the rim of this basin are bass and pike, in size and numbers seldom equaled.

West of Beaver Lake and connected with it by a narrow and short canal is a small lake, one not much short of three miles in circumference, and east of it is a cedar swamp and next a pond, after which comes a small deep lake which has never been fished.

This system of small lakes and ponds and swamps, is a peculiarly interesting geological feature of the region. Lying in the shape of a strung bow with the back to the hills and the arms curving to the great lake shore, they suggest that once they formed a part of the great lake itself. No doubt such was the fact. The evidences here and elsewhere along this south shore are indubitable, that at some period in the remote past, there has been a subsidence of not less than sixty feet and probably a great deal more than that, of the waters of Lake Superior. As that subsidence went on, the drifting sands from the Pictured Rocks above, lodging at the wide mouth of a narrow bay, a high bar or ridge was piled up, back of which lay a semi-circular basin six or eight miles long and one in width, which has since developed into these small lakes, besides ponds and swamps. On this high sand ridge grow soft woods almost exclusively, while back on the sandstone hills—the true ancient lands of the region—hard woods mainly grow, interspersed with occassional white pines of enormous size.

The region is not only interesting from its geological history, but from its classical associations also. In that unique poem, "The Song of Hiawatha," a poem that carries with it the odors of the pine woods and the gurgle of trout streams, we are told that after the mischief-making Paw-Puk-Kewis had

> "Vexed the village with disturbance,"

by teaching the young men

> "All the game of bowl and counters,"

and by raiding the house of Hiawatha and insulting old Nokomis his mother, and Minnehaha his bride, and finally, from the lofty brow of the Grand Portal, by killing his chickens, the gulls, that greatly wronged hero, in great rage, set out to bring the evildoer to just punishment. Long was the pursuit and well sustained the flight. After many and marvelous vicissitudes, however, the wily fugitive took refuge among the beavers, who in some mysterious manner changed him into a beaver, and made him

> "Ten times larger than the other beavers,"

after which he became their king. As might have been expected, his elevation to the beaver throne puffed him up enormously, so much so that he could not pass the doorway of his palace; and so, when Hiawatha had discovered the place of his retreat he cut the dam, and after the waters had run off the beaver king was at his mercy. He and his young men,

> "Pounded him as maize is pounded,
> Till his skull was crushed and broken."

The region we are now in, is the *locus in quo* of this tragic tale. Beaver Lake was the Ahmeek-sah-kah-e-gan of the Ojibwas, and here was in ancient times a great beaver center, and even yet a few stray beavers linger around the seat of that ancient empire, whose "signs" may be seen on every stream. The story as told by the poet is founded on Indian tradition, and as every tradition has some groundwork of truth to rest upon, I looked around me to see if I could find some one stream where the greatest number of conditions were to be found, which made probable the supposition that it was the one across which a dam was built, and where a beaver colony of such magnitude was established, as to excite the Indians' particular attention, and thus give rise to legends and extravagant stories. Into the south side of Beaver Lake a stream flows, and between that and the hills southward many miles of stream intervene, though as the crow flies the distance is not over two and a half miles. Along that stream in its upper half, I traveled for I know not how far, and as I whipped the little pools and eddies and filled my creel with richly tinted trout, I remembered that Paw-Puk-Kewis in his flight

> " * * * * came unto a streamlet
> In the middle of a forest,
> To a streamlet still and tranquil
> That had overflowed its margin;"

and here, thought I, is the forest and the tranquil streamlet, and what was more to the point, the entire course of the stream as far as I explored it, was filled with the ruins of ancient beaver dams and habitations. Indeed these curious animals have not altogether abandoned the stream yet. Occasionally fresh cuttings were met with, as also was an Indian camp that had been occupied the preceding winter, from which I secured a handful of the yellow and beautifully curved beaver teeth, plucked from the numerous decaying jaws lying around. This stream has been seldom visited by any save the Indians, and as it is unnamed in the Michigan maps, I venture to ask that it henceforth be known as the Paw-Puk-Kewis.

In addition to bass and pike in the small lakes, every stream in the neighborhood is a trout stream. Three miles west of our camp a stream thirty feet in width plunged over a rock wall, falling according to one authority one hundred and fifty feet. We did not visit this stream but were told that it abounded in trout of good size. Mr. Frank Milligan, a D. M. & M. Railroad official, had fished in it, and he said the trout were so plentiful and took the hook so greedily, that one soon tired of the sport.

We spent a longer time making camp than I had anticipated. One of the Judge's favorite maxims was, "That the success of a camping excursion depends mainly upon the comfortable arrangements in the camp itself." "No matter how successful in your hunting and fishing and tramping excursions," the Judge was wont to say, "unless you have a nice, comfortable, cozy camp to go to you will soon grow restless and discontented, and want to go home." And now that we had selected a permanent camping ground, I soon learned that, according to the Judge's standard, who was ably seconded by the Greek Professor, a camp meant a great deal more than setting up a tent. An awning was erected separate from the tent, which not only accommodated our table but afforded us protection from the dews as we sat in front of our night fire and talked over the events of each day. Boxes were converted into cupboards for the convenient and safe storage of provisions; racks were made on which to hang cooking utensils, and the camp ground was cleared of unsightly rubbish. The tent itself received particular attention. A gun-rack was set up at the head of our bed, and the bed itself was a work of art. "More than a

third of our time will be spent in bed and surely that third warrants us in doing our best to make it pass pleasantly," said the Judge, and the sweet and restful sleep that came to us all through our camp life on the Ahmeek-we-se-pe proved the wisdom of his words. Many campers-out, through ignorance in some instances doubtless, but generally through indolence, neglect to provide their camps with fixtures conducive to convenience and comfort, and as a consequence the discomforts endured often overbalance the pleasures enjoyed. A few hours of intelligent labor will make a comfortable woods home.

I think it was the afternoon of our third day in this camp that the Greek Professor came up the bluff with rod in hand and eyes fairly bursting from their sockets. "I never saw the like!" he exclaimed.

"What is it? Where is it?" we both asked.

"I never had such an experience before," returned the Greek Professor.

"Was it a bear?" asked the judge. Every novel happening in the woods can generally be connected in some way with a bear, although a bear is less apt to be encountered by the summer visitor to the lake region than any other animal save the wolf.

The Greek Professor said it was not a bear, but trout—speckled trout. "I have just caught seventeen running from ten inches up to fifteen down there at the mouth of the creek."

"Oh, pshaw!" exclaimed the Judge as his under jaw perceptibly dropped.

"But I have!" said the Greek Professor with energy, "and they are down there now in the minnow bucket."

"Darn it! Why didn't you tell me?"

"I couldn't," said the Greek Professor. "I mean I hadn't the time—that is, I couldn't stop."

But I don't think the Judge heard all the Greek Professor said. He flung aside the book he had been reading, and jointing his rod and tieing on his flies, he fairly flew down the bluff, notwithstanding his avoirdupois made such a feat somewhat hazardous, and cast into the swift waters below the drift pile at the mouth of the stream. The feathery lure scarcely touched the rough water ere there was a splash and a bite. The Judge "never saw the like," he said. The Greek Professor had followed close after the Judge's heels, and with great interest I watched the two as they plied their rods. Trout of excellent size and shining in the sun as unwillingly they came ashore, as if studded with brilliants, rewarded the fishermen's zeal.

O, what happiness, what felicity! But alas! They reminded me of children playing with pearls. Time and time again both had descanted on the criminal waste that characterized the sportsman in general and each had over and over asserted his abhorrence of the wanton destruction of fish and game, so common in our country; yet there they were fishing away till not a trout would rise to fly or spring at a worm. They had exhausted the preserve. The fish were "on the feed," and all the conditions happening to be right for them rising to the lure that afternoon, the beautiful and wary creatures had been transferred from the swift waters of the stream to the narrow confines of the minnow pails, and ere we could consume them, the half died and were thrown away. Thence on the greedy sportsmen were driven to other waters. The creek above its mouth contained many fine trout, but it was with great difficulty the fishermen could make their casts for the overhanging brush and the log-filled channel. In my presence they never afterward denounced in strong language greedy sportsmen.

The country we were in abounded in game as well as its waters in fish. Grouse, called partridge up there, were not infrequently met with in the woods, and any bright day the Beaver Lake visitor would be rewarded with a view of a deer at some point on the lake's margin. On the north shore of the lake and immediately across the ridge from our camp, the bank was high, whence you could see seven-eighths of the entire south shore line. One day we counted six deer at one time feeding here and there along that shore, and it was seldom, when the weather was favorable, that one or two were not seen.

The smaller lake lying westward of Beaver Lake, was even more frequented by them than the larger one. Along its west shore was quite a pasture ground of lily pads which was daily and nightly visited. One afternoon the Judge and I made the tour of this little lake, and we ran four in as many separate places out of the water.

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Fifth Paper.

AT Marsh a few miserable "Stick" Indians put in an appearance, and not a single solitary curiosity could be obtained of them. A rough-looking pair of shell earings that a small boy had he instantly refused for the great financial consideration of a jack-knife from one of the party, who supposed them to be purely local in character. Another trinket was added to the jack-knife, and still refused, and additions kept on to the original offer, until just to see if there was any limit to their acquisitiveness, the last offer stood at a double-barreled shotgun with a thousand rounds of ammunition, a gold watch, two sacks of flour and a camp stove, and in refusing this the boy generously added the information that its value was based on the fact that it had been received from the Chilkats, who had gotten it from the white traders. It had probably been made in Connecticut. A few scraggy, half-starved dogs nearly completed the outfit, the greater part of their composition being unmitigated belligerency, two of them fighting until they were so exhausted that they had to lean up against each other to rest. A dirty group of assorted sizes of children finished out the picture of one of the most dejected races of people on the face of the earth. They visited their fishlines at the mouth of the incoming river at the head of Lake Marsh, and caught enough to keep body and soul together after a fashion.

This manner of fishing of theirs is quite common in this part of the country, and at the mouth of a number of streams, or where the main stream debouches into a lake, their long willow poles driven into the mud far enough to prevent washing away, are often seen sticking up, swinging backward and forward by the force of the current, and on closer examination they reveal a sinew line tied to them about or a little above the water line. They occasionally did us good service as buoys, indicating the mud flats which we could thereby avoid, but the number of fish that we ever saw taken off of them was not alarming. The greatest number are usually secured by means of their double-pronged fish-spear, which is such a common fishing instrument among nearly all the nations of sub-arctic America, and even further south and north, and which I represent in the engraving.

The bent arms are made of very elastic wood or of the horn of mountain goat, musk-ox, or some such material, and armed at their free ends with re-entering sharpened spikes of metal, the long pole to which the bent arms are attached having a third spike, complete the triangle of barbs which receive the fish when speared from overhead, *S* in the figure being a salmon's back as the harpoon is applied. I never noticed the Tahk-heesh or "Sticks," with any nets, although they could easily have had them, so slight were my investigations in this respect. Among my trading material to pay for services, fish hooks were eagerly sought for by all of the Indians, until after White River was passed, and then the Yukon becomes too muddy for any kind of fishing depending on the fish's eyesight. Lines they are not so eager to obtain, their common ones of sinew evidently subserving all their purposes.

No good bows or arrows were seen among them, their only weapons being the stereotype Hudson Bay flintlock smoothbore musket, the only kind of gun throwing a ball that this great trading company has ever issued since they have come into existence. They also sell a cheap variety of double-barreled percussion-cap shotgun which the natives buy, and loading them with ball find them superior to the first named instrument of destruction (to powder). Singular as it may appear, these natives, like the Esquimaux I found around the northern part of Hudson's Bay, prefer the flintlock to the percussion-cap, probably for the reason that the latter depends on three articles of trade—caps, powder and lead—while the former depends on but two of these, and the chances of being short of ammunition, often many weeks' journey away from these supplies, are thereby lessened. These old muskets are tolerably good at forty to fifty yards, and are even reasonably dangerous at two and three times that distance, and in all their huntings they manage by that tact peculiar to savages to get within this distance of moose, black bear and caribou, and thereby to have a pretty fair subsistence the year round, with a summer diet of salmon and a few berries and roots. Some few of them had old horse (mustang) pistols, flintlock and smoothbore, that I could hardly imagine the use to which they could possibly put them unless it would be to present to their enemies on the verge of a war, or to give to the mother of their intended bride as one of the gifts usual to savages under such circumstances.

This Camp 15 was on a soft boggy shore covered with reeds, where a tent could not be pitched and blankets could not be spread and with the raft way out in the lake through soft white mud. I think that the whole combination, taken together and mixed with the inevitable mosquitoes and a few rain showers, made about as disagreeable a predicament as could be well imagined, and shows in a small way some of the usually unmentioned concomitants of exploration.

On the 29th of June we passed out of Lake Marsh and once more entered the river. On the lakes one man at the stern oar of the raft had been sufficient, but on the river an additional oarsman at the bow was needed, for at short turns and nearing sunken boulders or sand and gravel bars or steering clear of eddies it was often necessary to do some lively work in swinging the ponderous craft around to avoid these obstacles. I believe I made the remark in a previous article that managing a raft on a lake, especially with a favorable wind (and you cannot manage it at all if you have not a favorable wind) was a tolerable simply affair. It was certainly simplicity emphasized compared with managing it on a river, although one would think the reverse. Especially was this so on a swift river like the Yukon or any of its branches. Naturally a raft or any floating object will keep the center of the current of a stream if only left alone, after it is once put on that part, but the number of things that present themselves from time to time to drag it out of this channel seem marvelous. Old watermen and lumbermen know that when a river is rising it is very hard to keep the channel, and even the drift wood lines the shores of the stream, and they eagerly await the time when this commences flowing along the main current or at least is equally distributed over the water, for then they know that the water has started to subside, or is at a "stand still," as they say.

Again, a river with soft banks (and in going the whole length of the Yukon, over 2,000 miles, we saw all varieties of shore), the swift current, which one desires to keep in, using it for his motive power, only nears the shores at points or curves, where it digs out the ground into steep perpendicular banks, and here it is almost impossible to find a camping place, and this swift current has to be rowed out of to secure a camp at night, and has to be worked back into after breaking camp next morning. If the banks are wooded the trees that are constantly tumbling in off of these places that are being cut out, and yet hanging on by their roots, form a sort of *chevaux de frise*, that have received the backwoods cognomen of "sweepers," and a man on the atmospheric side of a raft plunging through them wishes he was dead, or at least that he was a muskrat so that he could dive out. To the inexperienced man who has never had his hair combed by a whole timber district in a brief minute these remarks may seem absurd, but to the old veteran raftsman it will awaken many a sigh of sympathy from his breast as he picks splinters three inches long out of it and digs the moss driftwood and leaves out of his eyes to look at his hat dancing on a limb a mile back, and takes an inventory of stock to see if that is all that is lost.

Again, when an island is made out ahead, the varieties of guesses as to which side the raft will pass shows how hard it is to tell, and it would be a splendid question for a civil service reform examination. It takes a peculiarly practiced eye to follow the line of the current of the stream from the raft's position beyond any obstruction in sight a good distance ahead, and more times than one our hardest work was rewarded by stranding us on the very bar or flat we were striving to avoid. The position of the sun, the clearness and swiftness of the water, the nature and strength of the wind blowing, however light it might be, and a dozen other abstruse functions determined whether a person could solve this apparently simple problem. If the upper point of the island that split the current around its two sides could be determined (and this was often as hard a problem as the other at any great distance) one could tell by projecting a tree directly beyond this point against the distant hills or mountains, and if it crept along them to the right, the raft might pass to the left of the island, and surely would do so if the current was not deflected by some bar or shoal between the raft and the island. And such shoals and bars of gravel, sand and mud are very common obstructions in front of islands, much more common than one would suppose, and too common not to be some dependency between them. These bars were not prolongations from the point of the island, but submerged islands, just in front of them, and between the two probably a steamboat could have passed. Using trees as guides to tell on which side of the island the raft might pass was, as I have said, not so easy as appears at first sight, for unless the tree directly over the splitting point of the current could be made out, all guesses were of but little value. The trees on the right and left flanks were always the most conspicuous by being fewer in number than the dense growth of the center of the island, and persons were prone to use these in making their calculations, and one can readily reason that when they were near and the island wide, both outside trees would appear to diverge, and according as you took right or left you would surmise you were going to left or right of the island. As a person stood on the bow, or down-stream end of a raft, and looked out on still water flowing along, the imagination easily conceives that they can follow up from that position to anything ahead and see the direction of the current leading straight for it. Again, eddies and slack currents are great nuisances, for though you may not get into the very heart of them, every time the sum total in a day's drift that they can injure you is considerable, and by a little careful management in steering the raft they can nearly always be avoided. Of course, you are often called upon to choose between them and other impediments, so that the mind is constantly alert as you drift on.

In a stream with no eddies or slack currents, everything goes happy until along toward evening, when you want to go into camp and the river tearing along at four and five miles an hour. I defy any person, who has never been similarly situated, to have any adequate conception of how a ponderous vessel like our raft, made of large logs and loaded with four or five tons, will bring up on any obstacle going at the rate already mentioned. If there are no eddies or slack currents into which it can be rowed or steered and its progress stopped or slackened, it is almost impossible to go into camp, for should the raft strike end on, a side log may be torn out and the raft converted into a lozenge by the shock. Under these circumstances we would bring the raft close into the shore, and with the bow oar hold the head out, while with the steering oar the stern end would be thrown against the bank, and this frictional brake would be kept up until the raft slowed down a little, when one or two, or even a half a dozen would jump ashore at a favorable spot, and with a rope complete the slackening until it was a gait that would warrant twisting the rope around a tree on the bank and a cross log on the raft, when from both places the rope would be slowly allowed to play out under strong and increasing friction, or "snubbing," as logmen call it, and this would bring the craft to a stand where she would receive a series of snug lashings if the current was swift.

Good camping places were not to be had in every stretch of the river, and worse than all, they had to be picked out a long ways ahead in order to swing the raft into them from the middle of the broad river. Oftentimes a fine place would be seen just as we were abreast of it, that had been concealed until then by some heavily wooded spur or point, and then of course it would be too late to reach it with our slow craft, and to go skimming along near shore was to compromise a good deal of our rapid gait. Running from swift into slacker water could be readily done by simply pointing the craft in the direction one wanted to go, but the reverse was not so easy, at least by the same easy means. I suppose the proper way to manage such an amphibious animal as a raft would be by side oars and rowing it end on, but as our two end oars—bow and stern—were the most convenient for work, and in going into camp at night or seeking the middle of the current in the morning we used them entirely, and rowed our bundle of logs broadside on to the position we desired, that is, if nothing prevented. We generally kept the bow end inclined to the shore we were trying the reach, and this, in passing from swift to slack, water helped us as already stated, and in a three-mile current we could keep at about an angle of thirty degrees from the axis of the stream as we made shorewards, and thus roughly calculate the spot on the beach where we would bring up. The greater or less swiftness of the current would vary this angle of course, and our calculations accordingly.

Our bundle of effects on the two decks made quite high piles fore and aft, and when a high wind was blowing—and Alaska in the summer is the land of wind—we had a sailing power with us that we could not lower, and that often swept us under "sweepers" or dragged us over bars or sent us down unwelcomed channels of slack water and in violent gales actually held us against the bank and successfully vetoed all possible movements forward. During hot days on the wide, open river the sun would come down with a blistering effect that would make one feel as if he was floating on the Nile or Niger, anywhere in fact except under the shadows of the Arctic Circle. Roughly improvised tent flies helped us screen ourselves to a limited extent from this equatorial torment, but if built too high, the stern oarsman, who had charge of the "ship," could see nothing ahead and it would have to be pulled down.

"Cut-offs" through channels that led straight across were often most deceptive affairs, the swifter currents always swinging around the great bends, and time was always made by keeping in them. Especially bad was a peculiarly seductive "cut-off" with a swift current as you entered it, on account of flowing over a bar, and then immediately deepening the current would slow down to a rate that was provoking beyond measure as you saw piece after piece of drift wood go rushing by in the main channel behind you, and in a little while could be recognized passing in front, having "taken the longest way around and the shortest way home," especially if both ends of the "cut-off" were visible from its interior.

Of submerged obstructions, snags were of little account, for the great ponderous craft would go wading through them. Sand, mud and gravel bars were by far the worst that we had to contend with, and I think I have given them in the order of their general meanness in raft navigation. Sand was particularly obstreperous, and when the gridiron of logs ran up on one in a swift current there was "fun ahead," to use a Western expression of negation. Sometimes the mere jumping overboard of all the crew would send the craft ahead a few yards, and in lucky instances clear the obstruction; but this was seldom, and those who made preparations for hard work were seldom disappointed. In a swift current the water would sweep out the sand around the logs until its buoyancy would prevent its sinking any lower, and out of this rut the great bulky thing would have to be lifted before it would budge an inch in horizontal direction, and when this was done we would often be cheered by

seeing the noble craft sink down again to repeat the same process. The simplest way off of a sand bar was to find the nearest point to a deep channel and swing the raft end for end up stream, even against the most rapid current, until the channel was reached, or in the most aggravated cases the load would have to be taken off and placed on shore, and when the "boat" was free she was "snubbed" into the first favorable place on the bank with respect to loading.

Looking back, it seems almost miraculous that a raft could make a voyage of over 1,300 miles along a river, starting at the very head, where it was really narrow enough to stop the raft if it should swing out of a straight course end on (as it did in the Payer Rapids), and covering nearly two months of daily sticking on bars and shooting through rapids, and yet get through almost unscathed. When I started I had anticipated building two or three of those primitive craft before I could exchange to good and sufficient native or civilized transportation. Mud bars were not near so bad, unless the material was of a clayey consistency, when there would be added a little bit of adhesiveness to the other impediments. In general, it was possible to pry right through them with muscle and patience. The best of all were the gravel bars, and the larger and coarser the gravel the better, and when they were cemented into a firm bed by a binding of clay almost as solid as rock, and as little yielding tendency, we could ask for nothing better, and always went to work with cheerful prospects of a speedy release. The prominent benefit from a gravel bar in assisting one over is not wholly due to the material, but in the fact of the swift current, which is a great assistance. By simply lifting the raft this great power throws it forward, and by turning it broadside to the current and "biting" alternately at each end of the long "boat," we passed over gravel bars on which I do not think the water was over eleven or twelve inches deep, although the raft drew nearly double that.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Tenth Paper—Folk-Lore.

THE OLD MAN AND THE ROCK.

Once the Old Man was crossing a large prairie, and becoming tired, he sat down on a rock to rest. After a time he arose to resume his journey, but before going he threw his robe over the rock saying, "Here, I give you my robe because you have let me rest on you. Always keep it." And he went away.

Now he had not traveled on very far when it began to rain, and meeting a coyote, he said to it: "Little brother, little brother, run back to that rock and get my robe, and we will get under it and keep dry." So the coyote ran to the rock, but returned without the robe. "Where is it?" the Old Man asked, "Si-yah!" replied the coyote, "the rock said you gave him the robe and that he was going to keep it."

Then the Old Man was very angry, and he went back and jerked the robe off the rock saying, "I only wanted to borrow the robe until this storm is over, but now that you have acted so mean about it I will keep it, you don't need a robe anyhow, you have been out in the rain and snow all your life, and it will not hurt you to always live so." Saying which he and coyote went up in a coulee and got under the robe.

Ere long they heard a noise, and the Old Man said: "Little brother, run up on the hill and see what is making that noise." Soon the coyote came running back and said: "Run! run! the big rock is coming," and they both ran away as fast as they could. The rock gained on them and the coyote, running into a badger hole, was run over and killed. The Old Man was very scared, and as he ran he threw off all his clothes, but the rock kept gaining on him all the time. Not far off he saw a band of buffalo bulls, and he cried out to them, saying: "Oh, my brothers, help me, help me; stop that rock." And the bulls all ran at it and tried to stop it, but it crushed in all their heads. Deer and antelope also tried to stop the rock, but they shared the same fate as the buffalo, and a number of rattlesnakes formed themselves into a lariat and tried to noose the rock, but those that formed the noose were ground to pieces. The rock was now very close to the Old Man, so close that now and then it would strike his heels. As he was about to give up he saw a flock of bull-bats circling over his head, and he said to them: "Oh! my little brothers, help me; I am almost gone." Then the bull-bats flew down against the rock and made their peculiar cry, and every time they struck it they chipped a piece off, and at last the chief bull-bat broke the rock in two. Then the Old Man, to pay them for saving his life, made very wide mouths on them and named them "Pis-tō'-iks"—fighters.

Moral: When you make a present never take it back.

THE OLD MAN AND THE ELK.

One evening the Old Man was walking along a ridge and he was very hungry. Not far off he saw a large band of elk, and he said to himself, "I will kill every one of those elk, and then I won't be hungry." So he went up to the elk and said, "Oh, my brothers! I am lonesome because I have no one to follow me." The elk said, "Go on, Old Man. We will follow you."

Then the Old Man led them close to a high cut bank, and he ran up a little and got down and came under the bank where it was straight up and down, and he called out to the elk, "Come on, here I am; jump right down." But the elk said, "It is so dark we can't see to jump. Build a fire." Then the Old Man built a fire, but still the elk were afraid to jump. "Don't be afraid," the Old Man said, "jump right down; it's nice; you will laugh."

Then the elk jumped and were killed, all except one doe elk, which stood on the bank yet. "I don't hear any one laugh," she said, and she was frightened and ran away.

Then the Old Man skinned all the elk and cut the meat up to dry and hung the tongues up on a pole. When it was daylight he went off, and at night came back very hungry. All the meat was gone; the wolves had eaten it all up. He took down the tongues one by one, but they were all hollow; the mice had eaten all the meat out of them. So the Old Man had nothing to eat that night.

Moral: Never kill more meat then you need.

THE OLD MAN MAKES SOME BAD WEAPONS.

Once the Old Man was fording a river when the current carried him down stream and he lost his weapons. He was very hungry, so he took the first wood he could find and made some arrows, a bow, knife and spear. When he had finished them, he started up a mountain. Pretty soon he saw a bear digging roots, and he thought he would have some fun, so he hid behind a log and called out "No-tail animal, what are you doing?" The bear looked up, but seeing no one kept on digging.

Then the Old Man called out again, "Short-tail ground-cater, what are you doing?" Then the bear rose up on his hind feet, and seeing the Old Man ran after him. The Old Man commenced shooting arrows at him, but the points only stuck in a little way, for the shafts were rotten and the bear pulled the points out as fast as they struck him. When the arrows were all gone he threw his spear, but that too, was rotten, and broke off. Then the Old Man grasped the bear by the hair and tried to stab him, but the knife handle also broke, for it was rotten. All his weapons were broken, so the Old Man turned and ran, and the bear pursued him. As he ran, the Old Man looked about for some weapon, but he could find none. Neither could he see any animal to help him. At last he saw a buffalo bull's horn lying in the path. Picking it up, he placed it on his head and turning round, shook his head at the bear, and bellowed so loudly that the bear was scared and ran away.

Moral: Always make your weapons of good wood.

[TO BE CONTINUED.]

THE COURT OF ARCTOMYS MONAX.

A LEGEND OF THE HOCKHOCKING.

IN my boyhood days I listened to labored and exhaustive exhortations upon the ground hog and how he influenced the weather for six weeks following the 2d day of February; but it was not for many seasons afterward that the sage and learned theories came back, like a flock of summer birds, bearing with them memory of the warmth still existing beyond the long, long portage of thirty years.

Last winter I read your request for some one to write of the ground hog. I felt impelled to write you then, but realizing the responsibility resting upon the historian, and knowing how necessary it is that he should be unbiassed when called upon to decide which version of many and conflicting stories touching past events shall be handed down to coming generations and preserved through time, my fears and diffidence overcame me and I refrained.

It is true that in what I send you now I may digress occasionally from the language of the narrator, but if I do it will be like a bright feather stuck in the ebon plumage of the crow, distinctly a child of adoption that does not affect the identity of the parent.

The ground hog is known to science as *Arctomys monax*, and passing the generic, possesses the following specific character: "Length to base of tail 14.50 inches, varying from 13.00 inches to 15.50 inches; of tail vertebræ about 4.50 inches; of tail to end of hairs about 6.75 inches. Color above, generally mixed fulvous, brownish-black and gray; below, yellowish-rufous, varying to brownish-rufous. Top of head, upper surface of all the feet and the tail, usually black or brownish-black, varied slightly with pure gray or rusty gray, and even to nearly uniform intense black. The ears are large, rounded, thinly-haired, generally gray. Tail full, rounded and bushy."

The ground hog is strictly a herbivorous animal. It is especially fond of peas, clover, grain, leaves and buds. It burrows principally in banks and bluffs, along some stream, though often found in the open fields. It usually produces from four to six young in the early part of the summer. It is not gregarious and hibernates through the winter, with an occasional exception, that I may hereafter mention.

The habitat of *A. monax* extends from the Carolinas northward to Hudson's Bay and from the Atlantic to Iowa and Minnesota, and is generally known as the woodchuck.

Almanacs in general have neglected to give due praise to the sage, but what they lack is more than made up in the loyalty of the oldest inhabitant.

The ground hog, as known to the "Moss-backs" of the Hockhocking, agrees in the main with the description of the naturalist, and while some may feel sore at my making public one of the oldest traditions of the valley, I here assert that I am not actuated by any motive of ill will in presenting to the world these facts, for I am a descendant of the oldest settler, and do not feel that it is my mission to bring discredit upon the sayings of a hundred years ago. Nor do I wish for any one to seek for personalities in the notes presented, for the garden has been weeded, and nothing will be entertained but the question touching their authenticity.

Once, possibly before the cliffs along the river had quit growing, a young man came into the valley, and by his decorous and gentlemanly bearing soon won the confidence of the people, and was quickly assigned a place in society. His accomplishments were many and varied. His experience, as given before the deacons and elders, was lucid, and clearly defined the influence of a great moral director in the formation of his character. He was a power among the young people. He acknowledged one day that he was a true sportsman. When afterward chided for shooting quail on the ground, deer out of season, and catching fingerlings for count, he defended his position by explaining that such divergences were allowable among sportsmen, when they were desirous of realizing just how many pangs and stings were apportioned the "pot-hunter." Such a show of philosophy, it is needless to say, silenced idle tongues, though it is thought to this day that the humanity of the most expert and discreet hands lends to them a weakness that drops into the experience of all sportsmen a something they would like to blot out.

Among the less orthodox portion of the community this young man was a wonder. He loved a good story, and had a penchant for "moonshine whisky" that inspired them with confidence and left his character unblemished. He was a "jam up fiddler," and through this accomplishment was able to win and marry Cindy Stone, the best looking girl in the valley. Smith—that was his name—lived to raise fourteen children and then expired. Peace to his ashes.

One time, at a barbecue on the 2d of February, Smith remarked that they would have six weeks more of rough, stormy weather. "Ground hog seed his shadder?" asked the boy from whom I have descended rather indirectly.

"No, responded Smith, "*Arctomys monax* has decreed it in open court. The king's will is law."

After the tempest of question had subsided, he explained that *A. monax* was the ground hog's other name, and that his palace was accessible to men once in a hundred years, and that the next reception would be the following season.

This news of course set things on end, and as many as four hundred meetings were held before it was decided who should go as an ambassador from the tribe of "Moss-backs." The choice fell on my father's father's father, he being a boy ten years old, and the son of the "boss chief." It was thought that his position in society better qualified him for the honor, such standing in society then, as now, rather giving a man the best show, though I have since been humiliated and mortified by learning that my ancestor did not even make a good cobbler, when in after years he renounced barbarism and became civilized. However, I am glad to be numbered among the children of that barbaric sire, who has handed down to his progeny honors that inspired with pride even the fourth generation.

Smith coached the young ambassador, and each day saw him better fitted to meet his "highness," *A. monax*. The tribal knowledge of royalty in those days was limited, but allowing this weakness, it was not an unplatonic gang, and the lad was armed with an address that was expected to take the cake, being couched in words of elegant diction and replete with beautiful conception. He was also instructed to bear clover and red and black haws as offerings. Everything being in readiness, the ambassador went into his father's tent for his blessing, and then started due east, expecting to "pull up" somewhere about what is now known as New York State. His instructions were not clear on that point; the ways of transmitting news in those days were defective, and doubtless degenerated into what is now known as the "Associated Press."

Many mishaps befell the boy during his travels, but he never faltered once, which fact has been accounted for in the family circle by the parting injunction of his father: "Get there, Eli!"

It matters not what destiny ruled him, for we know that on the 1st of February the footsore pilgrim knocked at the door of a humble cot among the mountains and struck the old hermit for a bed. After doing the weather and kindred subjects, the old lad drew a jug from some hidden recess and pronounced it crab-apple cider. This was fine on the old man's part, for the revenue officers were as strict then as they are now, and the production of fine old liquor in such an out of the way place might at some time have been the signal for a gentleman to rise to a point of order. The old man napped off for a moment, and finally came up standing: "Pleasure is transitory when you do not include mankind. Don't lie, even in telling a fish story. Don't steal even a watermelon. Meet all men as gentlemen and treat them as they deserve, even if you make a mistake. A kind word costs less than a bitter one; the first will warm, the latter chill a sorrow-laden heart. Don't preach charity, but practice it. At daybreak arise and travel to the east. Do not be surprised at what you may see, but learn all you can. Your coming will awake a king and his subjects from their winter sleep."

The next morning the pilgrim took up his grip-sack and tramped. He passed up a dark hollow and was soon lost among the shadows. It was a ghostly place to explore. His footsteps woke up old hoary-headed echoes that had slumbered for a hundred years. It sounded as though an army was marching up the defile. Fortunately, the diplomatic corps was "sandy," and marched on like a little man. By and by he came to a place where the rocks rose in a sheer precipice hundreds of feet high. For the first time he weakened, but soon rallied, when he noticed an escutcheon carved in the cliff and below it a huge knocker, which he at once sounded. The effect was magical. The time ball went down at six, the signal station displayed a storm flag, and down deep in the bowels of the earth he heard the hoarse baying of the dogs of war. Then, for the first time, he loosened his hunting knife and unslung his tomahawk, resolving to die as it best becomes the brave.

Just then two vast doors swung open, and sweeping up from measureless caverns, came soft winds laden with the perfumes of a summer clime. A few minutes later a dazzling light illumed a transparency and he saw this legend in characters of fire:

WELCOME, MOSS-BACK!

Proceeding cautiously, he soon found himself in a large and spacious room, well filled with the satellites of Winter and Spring. The stern old King in armor of white and with a mace of ice, glowered on him as he passed, while the gracious Queen and her train made him their captive and bound him with garlands of flowers. While contemplating the wonders around him, an unseen hand drew back the great curtain of mist that hung like a bank of snow to the north, and he marched with his fair captors into a grand audience hall, possibly a third larger than the Coliseum at Rome. To the right, to the left, and in fact, all around him, was a vast multitude of ground hogs. It was as if there had been a great storm, where it rained nothing but ground hogs. High up among the shadows of the vaulted roof, he heard the birds of passage singing snatches of songs. The brooks were freed from their chains of ice and the music of their babblement welled up out of the distance.

On a throne of gold, patterned after a bunch of clover leaves, slumbered the King. Back of him, on canvas, was a trout stream wandering through a clover field. The stream was full of speckled beauties, and bees foraged along the blossoming banks. It was a work of art, by an old master. The silver-haired King of Storms was called to the chair, but his wand failed to awaken the congregation, so Spring touched the sleepers and the great walls trembled at the tumultuous yawn.

Music, soft and sweet, floated down from hidden galleries. Deeper and stronger grew the measures, and when the fluted columns lent their thunders to the mighty symphony the ambassador beheld a kingdom of ground hogs tripping the light fantastic toe.

When his Excellency had finished a very difficult Irish jig, it was then that the offerings of the "Moss-back" were presented. Tears welled up into the eyes of the King as he looked upon the divine fruit. He called the young man to a seat on the throne, and after accepting his credentials as an ambassador, explained to him that the ceremonies yet to follow originated when Time was a yearling.

All sounds of the festivities had died away. On the right was the Queen and on the left the King. On the throne the "moss-back" and his Majesty. At a signal, a giant carried in a sun dial, about as large as the turntables now used about railroad shops. This he placed in the center of the hall and taking a hundred-pound cannon ball from his hip pocket stood facing the south. "At 12 o'clock," said the King, "he will throw that ball through the wall, and if the sunlight marks the hour, storms will rule for six weeks. If not, spring will take charge."

The bruised air shrieked along the track of the ball as it pierced the south wall and was lost in the blue deep beyond. Four minutes and a quarter went by, and lo, an arrow of sunlight dropped lightly upon the sun dial at high twelve.

My countrymen, what an hour was that.

In the twinkle of an eye every ground hog disappeared. Spring fled weeping from the hall, and Winter's buglers

sounded call after call along the corridors. The gusty clouds turned their mighty bellows upon the doomed building. Giant hands tore away section after section of the roof. From the lofty walls heaven's archery trained its enginery and filled the air with arrows of snow. Mocking voices catcalled among the shadows, while the Vulcan of Winter forged chains to shackle the universe.

The ambassador of the "Moss-backs" felt strange and out of place among such tumultuous scenes. A great longing sprung up in his heart to be at home, but he compromised by crawling into a hole.

At 6 o'clock a train as of giant powder knocked the palace into a cocked hat. A few minutes later the triumphal car of the Storm-king, drawn by a lumbering old blast, rolled noisily away toward the north; and then silence reigned.

When one week later the traveler stood in the council chamber of his people and related his experience, an aged chief arose and said: "Truth is mighty. Before it the fallacies of ages crumble away. It pains me to know that I was so many years in darkness. I repent, and feel that if a few more cannon balls could be thrown, and a few more arrows of sunlight illume the sun dial of life, we would have a fuller knowledge of our own weaknesses, and be better able to guide our fellows away from the shoals that have caught the wreckage of many a soul, that lied well but not wisely."

The hero was feasted on boiled dog.

Here tradition ends.

Some people are slow to believe this story, but among the "Moss-backs" it is never questioned.

A fitting monument has been erected in memory of Smith. Without him the world might have remained in darkness upon the great subject PARSON O'GATH.

BAIRD IRON WORKS, Gore, Ohio.

Natural History.

THE RAMBLE OF A NATURALIST.

BY JUDGE JOHN G. HENDERSON.

IN my boyhood days, long before I ever heard of Audubon, Wilson, Nuttall, or the Prince of Musignano, it was my delight to go alone into the deep woods with my shotgun, note-book and pencil, to study the habits and character of birds. And now, as often as spring returns, bringing with it the song of the robin, bluebird and the whip-poor-will, the old desire for the woods and the birds comes over me again. As often as the duties of my profession will allow, I gratify that desire; and although these ornithological rambles are not so frequent as they once were, yet even now the cry of the catbird, or the song of the brown thrush causes the blood to bound again through my veins, just as it did long years ago, when a barefoot boy I first saw the blue eggs of the one in the nest hidden in the briar patch, or counted the speckled eggs of the other as I peered into its curious nest hidden under the end of a rail on the corner of the old worm fence. Never shall I forget some of the impressions made upon my mind during these juvenile rambles. For example, I remember shooting the yellow-billed cuckoo (*Coccyzus americanus*.) To me it was then entirely a new bird, and I now remember distinctly how curiously I examined it; counting the feathers of the tail, noting the terminal spot upon each, the long pointed wings, and long curved bill, and the thought then came to my mind, "What an interesting book it would make, if some one would write a description of all the birds, and tell all about their food, their nesting and their habits." Poor, ignorant boy! What a treat would it have been had some friend placed in my hand Wilson's "American Ornithology," or Audubon's "Ornithological Biography."

But I have forgotten the object I had in view—that of taking you from the busy city, with its miles of sidewalk and monotonous stone or brick buildings, with me to the woods and the green fields. Billy is saddled and ready, while Pete, the old pointer dog, and Birdie, the little cocker spaniel, are both barking impatiently, so let us be off.

What is that bird with the long tail, the brownish back and light yellow abdomen in the old elm at the end of the lane? Listen to his harsh note, and see, there is his mate with something in her mouth. She is making a nest near here. Let us look for it, for they are hard to find. We need not look among the terminal bunches of leaves for a hang nest like that of the oriole, nor on the branches for a nest like that of the robin, or wood thrush, for the great crested flycatcher, builds its nest "in hollows in trees, stumps, or limbs." Its scientific name is *Myiarchus crinitus*. The eggs, four, five or six in number, are desposited on a bed composed of loose hay, feathers, hair of small quadrupeds, or the exuviæ of snakes. "Their ground color is a light buff, rather than cream color, over which are waving lines, marblings, markings, and dots of a brilliant purple, and others of a more obscure shading." (Baird, Brewer & Ridgway's North American Birds, Vol. II., p. 336.) "This flycatcher is tyrannical in a degree surpassing the kingbird itself," says Audubon, and he adds that they have frequent encounters among themselves in which they exhibit unrelenting fierceness and cruelty, sometimes even plucking a conquered rival. But see the female has gone into that hole on the underside of that big limb, full sixty feet from the ground, and perhaps some other day we may come with ropes and other contrivances to assist us in mounting to it, where we may obtain for our collection a set of their beautiful eggs; but now we will go on our journey.

Ah! there is a nest in the old thorn tree, about six feet from the ground. The reins are thrown over a stake and "Billy, stand there while we reconnoitre." That is the slender apology which the turtle dove calls her nest, a few coarse sticks laid together on the thorns in the fork, for a foundation, and lined with grasses. The cavity is not as deep as a saucer, and yet there is something there for that little bird-mother to love, and of which she is proud; for see, my hand is within a foot of her and yet she only eyes me curiously. Listen! we can almost hear her heart beat. Look at her beautiful eyes, and the lovely outline of form, her soft, blended plumage; but she is off, and pretending to be wounded, she goes fluttering through the bushes. That is what was once called instinct, but we have no time now to discuss the question whether it is instinct or intelligence, and, "Mother birdie, you cannot fool us now." Well do I remember, when a barefoot boy, I set down my basket of seed corn and gave chase to what I supposed was a wounded meadow lark (*Sturnella magna*); but such tricks won't win now; so, leaving our frightened bird to carry on her performance, as the lawyers say, *ex parte*, we will peep into her nest. One little red, downy dove and another just ready to break the shell! "Come back little birdie, we won't rob you of your treasures."

Listen! No such music as that ever fell on mortal ear, except in the deep tangled woods, under the shade of the great elms where sunlight seldom goes. That is the song of the wood thrush (*Turdus mustelinus*); but, lest you think me unduly enthusiastic over the song of a bird, let us recall Audubon's description of these notes. "Seldom," he says, "have I listened to the notes of this thrush, without feeling all that tranquillity of mind to which the secluded situation in which it delights, is so favorable. The thickest and darkest woods always appear to please it best. The borders of murmuring streamlets, overshadowed by the dense foliage of the lofty trees growing on the gentle declivities, amid which the sunbeams seldom penetrate, are its favorite resorts. There it is, kind reader, that the musical powers of this hermit of the woods must be heard to be fully appreciated and enjoyed. The song of the wood thrush, although composed of but few notes, is so powerful, distinct, clear and mellow, that it is impossible for any person to hear it without being struck by the effect which it produces upon the mind. I do not know to what instrumental sounds I can compare these notes, for I really know none so melodious and harmonical. They gradually rise in strength and then fall in gentle cadences, becoming so low as to be scarcely audible; like the emotions of the lover, who at one moment exults in the hope of possessing the object of his affections and the next pauses in suspense, doubtful of the result of all his efforts to please."

Such is the American Backwoodsman's glowing description of the song of the bird whose notes are now falling upon our ear. Doubtless he is singing to cheer the heart of his beloved, who is patiently sitting upon her nest somewhere near us. We know it is astride of a low limb, perhaps in the dogwood just beyond the brook. No, it is not there. Let us look in the tangled thicket away to the right. The brush is thick and apparently impenetrable, but by stooping we can get through, and when once in the middle we can easily see a nest if there is one there. Yes, there is a nest in the top of that low bush, supported partly by the bush and partly by the blackberry briars, but it is not that of the wood thrush, but of his cousin, the catbird (*Mimus carolinensis*). The scared mother has just left it and plunged through the thicket. Listen, there is her complaining note. The eggs are warm and fresh, and henceforth eggs and nest will occupy a place in our cabinet. As we deposit the eggs in our basket we think of the similarity of color in the eggs of this species and those of the robin (*Turdus migratorius*), the wood thrush and other members of the same family, except the brown thrush, and that this similarity extends even to those of the bluebird (*Sialia*).*

Carefully depositing the eggs of our catbird in the basket we are off again, wishing Mrs. Catbird better luck next time. Round and round we tramp, with both eyes wide open, but no nest of the wood thrush can we find.

So we mount Billy again and ride another mile, then tie and into the woods again. Birdie is giving tongue, as the sportsmen say, beyond the creek, but he is only after a gray rabbit (*Lepus sylvaticus*). See! there it goes skulking through the grass and weeds, crouched down almost to the ground. Old Pete looks at it as it passes, but too well trained to "chase fur" he only looks at us and wags his tail.

But a little gray bird arrests our attention as he sits upon the end of that old snag jutting out over the creek. That is the wood pewee (*Contopus virens*), busy getting his breakfast. See him turn his head from side to side as he watches for insects. Look at him through this field glass. See the expression of his eye, his erected crest. See him launch into the air, seize his prey, always returning to the same spot. He is small and not brilliantly colored, but he is a curious bird. His nest may be within twenty feet of us, on the jutting limb of that old oak, and his beloved little partner eyeing us curiously; but we will have a good time finding it. Of the nest of this bird, Audubon says: "Were it not that the bird generally discloses its situation, it would be difficult to discover it, for it is shallow, well saddled to the branch, and connected with it by an extension of the lichens forming its outer coat in such a manner as to induce a person seeing it to suppose it merely a swelling of the branch." [Ornith. Biog., Vol. II., p. 95].

So giving up the search without an effort, let us ramble on. Yonder is the cardinal grosbeak. Somewhere near us is his nest, for his song, that we heard but a moment ago, is hushed, and he now only utters a short alarm note at intervals as he watches us. Now, while crawling on our hands and knees in the brush on the hillside near the creek, directly overhead we spy a nest. It is about eight feet from the ground astride of a small elm that is bent over at the top. See the bird is on. We can only see her head, the underside of her bill and throat; but we know by the specks on the latter that she is the wood thrush; but she is off and away through the thick brush, before we have time to get a good look at her. The nest is too high for us to look into, the tree too slender to climb, so we carefully remove it, and what do we find? Three eggs of the wood thrush and one of the cowbird. This is the fourth time this spring that we have found nests containing the egg of the cowbird, viz.: one in the nest of the robin, one in the nest of the field sparrow (*Spizella pusilla*), with two eggs of the rightful owner; one in the nest of the wood thrush, with three eggs of the owner, and three in the nest of the cardinal grosbeak (?) with three eggs of the latter, and the present instance.

The three cowbird eggs were brought to me by a little boy, who said he found the six eggs in one nest. The nest he had destroyed; so I had no means of identifying the rightful owner, except by the eggs, which I believe to be those of the cardinal grosbeak. Had we known that the nest now before us contained an egg of the vagabond cowbird, we would not have taken it down, but allowed the wood thrush to incubate it, and by observation have determined whether birds as large as this thrush rear the young cowbird.

These eggs were all fresh, but the mother bird was carefully sitting on them, just as if the whole four were her own. Mr. Ord mentions two instances in which the wood thrush hatched the egg of the cowbird, and Mr. J. A. Allen saw in Western Iowa a female brown thrush (*Harporlynchus rufus*) feeding a nearly full grown cowbird. Dr. Brewer says this is an interesting fact, and the only evidence we now have that these birds are reared by birds of superior size. (Baird, Brewer & Ridgway's North Amer. Birds, Vol. II., p. 155). Our haste in the removal of this nest prevented the opportunity for making valuable observations upon this point, but it is too late now, and as we sit down on the sloping bank to number the nest and eggs, we fancied we could see the little female cowbird, with palpitating heart, hurriedly depositing her egg in the stranger nest, and the consternation of the thrushes when they found it.

Careful observers have noted these occurrences and described them in felicitous language. Audubon says: "When the female is about to deposit her eggs she is observed to leave her companions and perch upon a tree or fence, assuming an appearance of uneasiness. Her object is to observe other birds while engaged in constructing their nests. Should she not from this position discover a nest, she moves off and flies from tree to tree, until at length, having found a suitable repository for her egg, she waits her opportunity, drops it, flies off, and returns in exultation to her companions." (Ornith. Biog., Vol. I., pp. 495–496).

Dr. Elliott Coues describes the same performance in the following quaint and felicitous language: "It is interesting to observe the female cowbird ready to lay. She becomes disquieted; she betrays unwonted excitement, and ceases her busy search for food with her companions. At length she separates from the flock, and sallies forth to reconnoitre, anxiously indeed, for her case is urgent, and she has no home. How obtrusive is the sad analogy! She flies to some thicket or hedgerow, or other common resort of birds, where something teaches her—perhaps experience—nests will be found. Stealthily and in perfect silence she flits along, peering furtively, alternately elated or dejected, into the depths of the foliage. She espies a nest, but the owner's head peeps over the brim; and she must pass on. Now, however, comes her chance; there is the very nest she wishes, and no one at home. She disappears for a few minutes, and it is almost another bird that comes out of the bush. Her business done, and trouble over, she chuckles her self-gratulations, rustles her plumage to adjust it trimly, and flies back to her associates. They know what has happened, but are discreet enough to say nothing—charity is often no less wise than kind." (Birds of the Northwest, p. 185.)

Audubon says: "When the female returns and finds in her nest an egg which she immediately perceives to be different from her own, she leaves the nest and perches on a branch near it, returns and retires several times in succession, flies off, calling loudly for her mate, who soon makes his appearance, manifesting great anxiety at the distress of his spouse. They visit the nest together, retire from it, and continue chattering for a considerable time. Nevertheless, the obnoxious egg retains its position, the bird continues to deposit its eggs, and incubation takes place as usual." (Ornith. Biog., Vol. I., p. 497).

But leaving our wood thrush to console herself in her affliction over the loss of her eggs and nest, with the fact that the hated cowbird egg is gone too, let us pass on. Now hold on to my hand while we cross the slender log over the creek, and we will follow up the ravine in the wheatfield. It is skirted with bushes—just the place for birds' nests. Out from under that clump of bushes Pete scares a yellow-billed cuckoo (*Coccyzus americanus*), but no nest there. Further on in a little brush, on the margin of the ravine, we find the nest of a little sparrow, probably the black-throated bunting (*Euspiza americana*), but as it contains but a single egg we leave it. Its unusual position—about five feet from the ground—causes us to hesitate as to the species. There, in that clump of roses, is a nest of the brown thrush (*Harporhynchus rufus*), with a single half-grown young one in it, and beyond, in the forks of a small elm, about eight feet from the ground, we find the nest of the bluejay (*Cyanurus cristatus*), containing three eggs, all of which are numbered to correspond with the entries in our "Field Book," and we seek for other "spoils;" but we know by experience that it is useless to expect to find other nests very near that of the bluejay, because birds are careful to shun such a robber.

Trudging on up the ravine, Pete comes to a point on a turtle dove, she flushes, feigns to be wounded, and her nest is found about three feet from the ground in the forks of a little elm, on the bank of the ravine. It contains two fresh eggs, and, as the nest is an unusually good one for the dove, we number it among the ornithological specimens of our cabinet, and, while making the entries, we see a female black-throated bunting (*Euspiza americana*) slip off her nest and steal away amid the briers. The nest, within six feet of that of the dove, is about a foot from the ground, neatly made, lined with slender grasses, and supported by being built against a blackberry bush, and held in place by weeds or grasses. All the nests of this species which we have ever found have been up off the ground, although the books say that the usual nesting place is on the ground. It contains three pale blue eggs, about the size and shape of those of the bluebird (*S. sialis*), and, as these nests are hard to find, of course we take it. Down the fence, within fifty yards, in a little thorn, about fifteen inches from the ground, we find a beautiful nest of the field sparrow (*Spizella pusilla*), containing four eggs, about the size and shape of those of the chipping sparrow (*Spizella socialis*), but differing in color. These are white, with brown blotches about the larger end, while those of the chippy are pale green with similar dots. As we desire to take the bird, we leave the nest and eggs for another day.

Returning down the other side of the ravine we find the nest and four eggs of the catbird (*Mimus carolinensis*) in a thick clump of roses.

Crossing the wheatfield westward along an old, blown-down fence, we find the indigo bird (*Cyanospiza cyanea*), the black-throated bunting and the Maryland yellow throat (*Geothlypis trichas*), all of which, by their actions, probably have nests in the vicinity, but none of which are we able to find. Allow me to say to you that never yet have I had the good fortune to find the nest of the latter bird. The books all tell us where to look for them, in old brier patches, on the ground, and, judging from the number of birds of this species seen in a day's tramp, they must be plenty in my locality, yet, as above stated, I have never found a nest. By the way, all three of these birds are the victims of the cowbird's laziness. Audubon told Brewer a curious story of how the cowbird got its egg into the nest of the golden crowned thrush. This nest, built on the ground and so constructed as seemingly to preclude the possibility of the cow birds depositing its eggs in it, but Dr. Brewer says that Audubon told him that it was the custom of the cowbird to roll her egg along on the ground and thrust it into the nest with her head.

Leaving the upland, let us go now upon the river bottom as the bald, grassy bluffs just before us indicate that we ar-

* Audubon mentions many points of resemblance between the robin and bluebird, to which might be added the spotted breast of the young of the former, and similarity in the color of the eggs. All of these facts corroborate his judgment when he says that if he "were now engaged in forming an arrangement of the birds of our country he might conceive it proper to assign the bluebird a place among the thrushes."—Ornith. Biog., Vol. II., p. 86.

near there. Coming to a heavy undergrowth on the bank of the creek, just beyond where it enters the lowlands, again Billy is tied to the fence, and we plunge into the almost impenetrable brush. Just to the left, beyond that big log, is the object of our search. About twelve feet from the ground, in that slender box-elder, we see a nest, looking for all the world like an overgrown nest of the turtle dove, and above it we see the eye and the long bill of the mother bird. It is but a moment's work to mount the tree, and, as we do so, the flapping wings and long, dangling legs of the bird as she leaves show her to be the green heron (*Ardea virescens*). This we knew before, for already we have taken six eggs from this nest, four on the 7th day of May, two more on May 25, and to-day, June 4, we find three more, which we carefully number and place in our basket, for in this locality the nests of the green heron are not found every day. This makes nine eggs added to our collection from this one nest. They are of a beautiful pea-green color, about the same shape at either end, and are an inch and three-eighths in length and one and one-eighth in breadth. The nest we carefully leave, expecting to get a dozen more eggs from it at least, and then add both nest and bird to our collection; but counting eggs before they are laid is the next thing to counting chickens before they are hatched.

Again the notes of the wood thrush greet our ears, and again we search for the nest, and in doing so find two nests of the cardinal grosbeak in alder bushes. They are just completed, apparently, and their location is carefully noted in our field book, to be looked after in the future.

That long-tailed bird that just flitted by us is another yellow-billed cuckoo. Wilson says that the nest of this bird is usually fixed among the horizontal branches of an apple tree; sometimes in a solitary thorn crab, or cedar, in some retired part of the woods. The eggs are greenish blue. The only nest of this bird I ever found was in the top of a low tree overspread with a grape vine, and as many of these are near us forthwith we examine them hoping to find a nest of this species. See, there is something in the top of this one. We shake the vine that scrambles over the tree, and out bounds a fox squirrel (*S. magnicaudatus*). Striking flat on the ground, he bounds away, with Birdie at his heels, Pete refusing to "chase fur."

But now it is near night, and we have one other locality to visit. In the lowlands beyond the sandridge the redwing blackbirds (*Agelæus phœniceus*) are, or ought to be, nesting. Our faithful Billy soon carries us there, and the first sound that greets us is the *con-cur-ree-e-e* of the redwing, as he rises and falls with the wind on a swaying reed in the marsh. In a few minutes Billy carries us to the middle of the swamp, for the mud is not deep, and all about us are the nests attached by their sides to the weeds and grasses, and in them are the beautiful marbled eggs of this species. We take the first, containing four as pretty eggs as ever gladdened the eye of the oölogist, and then another, and another, until our arms are full. Riding ashore we deposit our treasures, and wading in, we collect more, until want of carrying space cries "hold, enough."

And now with our collecting basket packed with eggs, and another great basket full of nests, we start for home, fully satisfied with our day's work, and only regretting that we did not take our breech-loader with us, in which case some of the feathered beauties that complained so bitterly of our robbery would add their beauty to our case of birds. As we ride slowly home, thinking of loved ones, our heart is gladdened by the clear ringing "Bob White" of the quail from the neighboring wheatfields, and we remember that last summer, while attending the meeting of the American Association at Cincinnati, amid the noise of the city, we were suddenly greeted with the same "Bob White" in one of the busiest streets, when looking overhead we saw our familiar bird in a cage at a negro woman's window. But we are home again. Billy is fed, we have disposed of a fine spring chicken, our ornithological treasures are spread out on the table in my study. To-night will bring us "balmy sleep," and to-morrow we will go to our briefs and law points again, just as if we never inhaled the country air, laden with the perfume of clover blossoms, just as if our hearts had never been gladdened by the *coo-coo* of the rain crow or the song of the wood thrush.

FOOD FOR THE BIRDS.

IT is the "off season." Very off. Out of season for man, beast or bird. It is an exceptional season. Sitting here, in my little back-woods den, I see the snow come down, hour after hour, until past midnight. Then comes a dash of rain. It lasts half an hour. Next, a light, feathery snow, and a sudden drop that sends the thermometer to 10° below zero. Then seven successive mornings in which the mercury ranges from 4° to 11° below, and another snow-storm, ended by a sudden rain of two hours, topped off with a light snow. Two heavy falls of snow, each with a crust, and a light tracking snow on top.

It is not a bad winter for game. There is no ice-glaze on the trees to starve the grouse. No hound can run on this double crust, but hares can. The fox laughs at the hound; also the rabbit and hare. It is a rough season for beasts and birds of prey.

A horned owl, the Canada owl, came into my barn last night and collared my last game hen. I heard the row, and jumped out into two feet of snow in my stockings. As he was heavily sailing off with his prey I took a snap shot and he dropped the hen, but went off to the dense hemlocks to the eastward all the same. As we counted seven shotholes in the hen, we are afraid he will not come back.

A family of muskrats come into my orchard nightly on the chances of rotten apples. I do better by them. I have bushels of apples in the cellar that are slowly decaying. I take these out and empty them where rabbits and muskrats can easily and safely reach them. It amuses Mrs. N. and me to sit by the window and see them work, carrying off the worthless apples in the dim moonlight. Then we have chickadees, chickarees, bluejays and woodpeckers. We feed them faithfully, even the little blue-grey nuthatch. We hang liver, pluck, kidneys and suet in the trees, and we couple up ears of corn with twine and toss them into the tops of apple trees for the bluejays and chickarees. We are so far and a trifle lonely. A little amuses us. NESSMUK.

WELLSBORO, Pa.

AN ALBINO TEAL.—I saw an albino duck to-day—a green-winged teal. It was caught in a net with others and preserved alive. On Christmas Day it was sent as a present to the market-man, and is now confined in a cage—as tame and fearless as any domestic duck. It is not pure white, but a light ashen gray, save a dark spot on each wing.—W. N. B. (Denver, Col., Dec. 27, 1883).

CALIFORNIA QUAIL IN CONFINEMENT.

ABOUT a year ago there was presented to a lady here, a pair of California quail. By exercising a great deal of care, and paying the birds daily attention, she has kept them in perfect condition and plumage.

They originally came from New Mexico, being brought here by a gentleman on his homeward journey. Their traveling companions was a pair of mocking birds, who died shortly after their arrival, but the quail, seemingly liking the change in climate, flourished.

Their present home is a very large cage. Each morning the bottom is covered with fresh earth, in which the birds delight to bathe and wallow, much after the fashion of a chicken.

At first they were very wild, all attempts to quiet their fears proving ineffectual, but as time went by, they gradually lost their shyness, till now they are as gentle as they were wild at first. They are perfectly happy and contented, enjoying each other's society as much as they would in their natural haunts.

Their diet consists solely of wheat, with greens given every now and then, as a relish.

One peculiar feature regarding these birds is, that during their captivity they have never been seen to bathe in water, although the sand bath is a daily performance. They have made no effort to breed. NEMO (of Texas).

FRANKLIN, Jan. 26, 1884.

NOT A BEAR.—A Berwick, Pa., correspondent informs us that the telegraphic report (quoted in Mr. Litchfield's article two weeks ago), stating that a man had been killed by a bear near Retreat Station, Pa., was incorrect. The tracks were made by the bare feet of the man, and were at first supposed to have been the traces of a bear. This only illustrates the unreliability of the average newspaper bear stories. The rest of Mr. Litchfield's paper, however, commends itself as a plain, unvarnished tale of actual experiences, and may be accepted as a valuable addition to the authentic records of the grizzly's ways.

A FINE ROUGH-LEG.—It is rare that a really fine specimen of the black hawk variety of rough legged hawk (*Archibuteo lagopus sancti-johannis*) is captured. There is now a beautiful specimen of this fine bird in the shop of Mr. O. B. Deane, taxidermist, Springfield, Mass., that was taken at Northampton. There is hardly a feather on him of other color than pure black. The meadows about Northampton abound with this species more than of any other, the mottled variety I mean, and I think no less than fifty in various plumages have been taken during the past few years.—W. A. STEARNS.

MAINE WINTER BIRDS?—Vinalhaven, Me., Jan. 24.—I saw several robins yesterday; they were feeding on the snow among some tall grass. My curiosity prompted me to investigation, and on repairing to their dining room found they were feeding on small spiders. The spiders seemed to be lively, and I supposed they came out of the bunches of grass. Temperature at the time 42° F. Saw a crow blackbird about a week ago, also a golden-winged woodpecker. Is it not rare to see them in this far north country during such extreme cold weather?—MEDICUS II.

ALBINO RUFFED GROUSE.—Somerset, Pa.—Mr. George H. Tayman has received a full-grown, pure white, pink-eyed partridge, or pheasant, as they call it here. It was shot near Oakland, a summer resort on the Baltimore & Ohio Railroad, about thirty-five miles from this place.—W. V. T.

Camp Fire Flickerings.

"That reminds me."

97.

MANY, many years ago, I was a youngster and semi-attached to a command of our country's brave defenders, who did duty along the Gulf coast. I was fond of a gun, as what boy is not? Upon one occasion a small detachment of our command was encamped upon a small grassy island off the coast of Texas. It was plentifully stocked with deer and the easiest way to get them was for the hunter to bury himself in the sand and wait for them to come within range. One day I borrowed a gun from the engineer, and set out on a deer hunt by myself. Proceeding about three miles I sighted the game, picketed my horse, crept up as near as I could safely, scooped out a hole in the sand and covered myself up, all except head and arms, completing the "blind" by some tufts of grass I had plucked for the purpose. The deer were feeding quietly but approached my hiding place very slowly. The sand was warm and comfortable, and without a thought I dropped asleep. When I awoke, the sun was just going down and deer were feeding all around me at short range. Cautiously taking up the gun which lay in front of me, I got ready for a shot. Then I concluded that I might as well get two or three deer and waited for a string of them to get in line. At length a splendid buck and two does came in range and I cut loose.

When I again awoke the stars were shining. There was a peculiar feeling about my face, and upon putting up my hand I found it was caused by a thick covering of blood that flowed from a long deep gash in my forehead. Under my hand lay the butt of the gun stock. I dug myself out of the sand, and feeling around in the grass, I picked up a piece of gun barrel about eighteen inches long and split open through most of its length. Wearily making my way to where the horse had been left I found him gone and continued the pilgrimage on foot to the camp.

The next morning I laid the relics before the engineer with the remark, "Mr.——, here's your gun—two of them I might say." "Yes, yes, but what's the matter with it?" "That's just what I would like to know," I replied. He looked it over again and then asked, "Did you load it?" "No, sir; I supposed it was loaded when I borrowed it, and I still think it was." Then he called "Sam." An ebony chattel belonging to him and of about my own age responded. "Sam, did you load my gun?" "Ye-yes-yes, massa, me load 'm." "How did you load it?" "I-I-I jes put in a heapin' handful of powder, massa." "Then what?" "Then I jes put in four big bullets an' pounded 'em down with a iron ramrod as far as they'd go, but they wouldn't go clean down."

Then I went back to the scene of the hunt to gather up the slaughtered deer, but none were to be seen, nor was there either blood or hair to suggest a tragedy except around the sand hole where I had taken my nap, and they had never belonged to a deer. DODGERS.

GONE TO FLORIDA.

98.

Story 67 of "Camp-Fire Flickerings" reminds me of one I have either read or heard told. An elderly darkey, coming home one winter's evening with rather more benzine than ought to be carried at one load, took up his position before the old-fashioned fire-place. Putting the heel of one boot upon the toe of the other he proceeded to warm his feet and in so doing fell asleep. On awakening his first glance was directed to his boots. With a half drunken leer he said, "Stan' aside dhar sonny an' let yer poo' ole fodder warm hisself." Just then the top foot fell to the floor, and with a "tank ye chile, tank ye; I'll award ye," he resumed his nap. MILLARD.

CHEYENNE, Wyo.

99.

In your "Talk" you say that Cuvier, with a single bone could reconstruct, or at least said he could, the animal from which the bone was taken. That reminds me of an occurrence in this place a good many years ago. One day an alarm was sent out that a bear had crossed some open lots on the outskirts of the village. All the little, and big, and old and young hunters started out to hunt that bear. The stories which were told at the post-office and stores by the returned hunters in the evening were remarkable. None had seen the bear, but a good many came very near seeing it. At last Gus, the oldest hunter and greatest prevaricator in this region, came in. All turned to him to hear his report. "Well, Gus, did you get a shot at the bear?" was asked. "No, I did not get a shot at him, but I saw him and he weighed 400 pounds, I am sure!" he replied. "Why in the world didn't you shoot him?" they all asked. "Well, you see, I could only see a spot of him about the size of my hand, and I wanted to get a better view of him and he disappeared in the bushes. H.

Game Bag and Gun.

CHILL DAYS IN NORTH CAROLINA.

The wind it blew,
And then it snew,
And then it thew,
And then it friz.—*Anonymous.*

IT was my purpose on Friday, the 4th of January, 1884, to get my friend Teceel, with his two dogs, Nip and Joe (the latter a young black and tan setter, recently sent him by Calvin Pemberton, of Arkansaw), and go on the Monday following to the old Leak plantation, at the confluence of Little River with the Pee Dee, to pay our respects to the birds, which are abundant at that locality. I had written to my philosophic kinsman, Crickett, who lives on the west side of the river, to listen for our guns in the afternoon, and if he heard them to make his appearance that night at the hospitable house of a gentleman whose kindness and that of his family I have often enjoyed, and the next day we would go up to Toney's Ford, where he could get an opportunity to redeem his character, which was somewhat imperilled at that place on a former occasion. He had announced his purpose to join us, provided he could get some gunpowder and wads with which to load his shells. For his supplies of all kinds in this line he generally looks to me, and though his guardian ("ad litem" will do in this case) I find it somewhat difficult to provide for his adequate support, owing to his constant shooting at anything which can fly or run. My own shells were ready. I did not doubt that we should have several days of capital sport, for I knew game was plenty enough to afford it, and I had great confidence in the foresight of the weather prophets, who had assured us of an exceedingly mild winter.

On Saturday, the 5th, though the morning looked a little gloomy, I supposed it was only premonitory of a gentle rain, and that when Monday came the ground would be dry, and the sky clear—a bright sun making the atmosphere quite as pleasant as could be desired. So, taking a broken umbrella—the only one which the familiarity of my friends has left me—and leaving my overcoat at home, I collected my letters and went down to my office to transact such business as my position imposes upon me, and get all things ready, so as to enable me to be absent for several days. The wind was blowing somewhat keenly from the north, to be sure, but I took it that the temperature was not likely to become colder. I had not been seated at my desk very long before the gentleman who has charge of the construction of a stone dam for the mill came in and told me that he was apprehensive he should be obliged to stop work, for the snow was beginning to fall. I looked out and saw that the flakes were falling rapidly then upon the pond, "a moment white, then gone forever;" but the others lay and accumulated upon the ground. When I returned to my home the whole earth was covered with the white mantle for the depth of over an inch, and there was no abatement of the fury of the storm. The thermometer indicated a falling temperature, and next morning the mercury showed 1° above zero. This is rare with us. On the 20th of January, 1857, the register was 3° below, but never since then, until Sunday morning, the 6th of January, 1884, have we had so cold a time by several degrees. They who are accustomed to a more rigorous latitude must not smile at the shivering of one who complains when the mercury sinks in the tube only 30° below the freezing point. It is now too cold for any comfort.

[By the way, the phrase "cold comfort" used by King John when, because of a burning fever which raged within him, he wanted all the rivers of his kingdom to flow through him, "and comfort him with cold" (Act V. Scene VII.) has no very agreeable significance when "the winter thrusts his icy fingers in our maws."]

It was but little while after reaching my house, kicking the dry snow from my boots, entering the door and coming before a blazing fire, that I reached the conclusion that the proposed hunt for Bob White must be abandoned for a more congenial occasion. And thus that trip was not taken.

But about ten days before that time, Jim LeG. and I, with my son whom I call Dumble, with our dogs, and a young man named Rill Wobbins, who was going to visit his sister, drove up to the plantation before named, which is about fifteen miles northwest of the place where I live. I started with only 118 shells, supposing that Dumble would not want more than thirty-eight, and I could use the others

in my 16-bore hammerless. Soon after arriving we got up a splendid covey, out of which we bagged six. Crossing a lagoon and going down the river we started three or four others, and that night reached the house of our friend P. N. S. with twenty-eight birds. Next day we bagged over forty, exclusive of a woodduck and a woodcock, and would have done still better but for a rain which interfered with us. Owing to the fact that my dog Branch not only refused to hunt where I wanted him to, and when I was somewhat imperious in my commands actually ran from me. I saluted him with a load of No. 8 shot at less than forty yards. This expedited his retreating movements somewhat, and I did not have the pleasure of his company again. My friend Tom S. had a bitch, however, who fully supplied his place. This bitch was the same one I bought two years ago, because she was recommended as "a good retriever from land and water," and whose exploits in Chatham I faintly described in the FOREST AND STREAM. Well, she has improved since that day, and is now a very fair field dog.

I found Branch that night about feeding time, and he looked at me as if he feared I would shoot him again. His fears may not be groundless. That depends, very greatly, upon whether I am simple enough to give him a chance to try my patience, and if I am, whether he attempts to run off from me. If he does, he will get a load at very short range, and there will be a dog skin for somebody. I very much fear that I was badly fooled in that dog. I have another, a Laverack, about fourteen months old, and a black and tan pup, about five months old, presented to me by my friend A. H. Galloway, of Rockingham county. I trust these two may be made of some value. In the hands of a dog educator, no doubt, they would be made so. But I am hardly patient enough for that sort of business.

After this digression, I return to the subject to say, that the day following we returned home, and on the way called at the plantation where we five hunted. We soon had up some birds, and after I had shot awhile, I found that my shells were exhausted. Rill Wobbing had used my little Webley, and had fired more than thirty times. Tom S., however, who rarely hits a bird, though he is an adept on rabbits, generously tendered me the use of his 12-bore, and I was thus enabled to finish the hunt. We got thirty-one birds, and after taking ten each for ourselves, and giving Tom an equal number, got in our buggies and reached home that night. During the trip we killed over 100 birds, and left enough to stock several thousand acres of land.

If the weather and my business permit, I shall try that section again before the season expires. It may be that I shall have Mud along with me, with the gun he did not swap, and I shall have some amusement. He always affords it. If I can get him to accompany me, and then match Crickett against Teeel, we shall, at least, have a jolly time, and, besides, supply our hospitable friends with all the birds they can eat.

This has been written when the temperature was too low for any comfort, and after thawing the ink. My handwriting, which, my friends say, is none of the most legible, I apprehend you will find trouble in reading. WELLS.

JAN. 7, 1884.

THE GREAT LONE LAND.

ALTHOUGH I have perused the columns of your valuable and entertaining paper for nearly two years, I have failed to perceive any correspondence from what I consider the sportsman's "Eldorado," this great Canadian Northwest. It is universally conceded to be so by all sportsmen who have visited the magnificent grounds, shot ducks and prairie chickens, geese and swans, pelicans and wavys, partridges and rabbits by the score.

The city of Winnipeg is situated on the main line of the Canadian Pacific Railway, at the junction of the "Rushing Red" and the Assinaboine rivers, about 475 miles northwest of St. Paul, Minn., where there now stands a city of some thirty or forty thousand inhabitants. Many old settlers remember when the buffalo, a race now nearly extinct in the Canadian Northwest, roamed in countless hundreds; and even now, in close proximity to the city, their trails, on which they tramped single file during the troublesome and rebellious years of our forefathers, are still distinctly visible; and, should you visit the town of Calgary, on the Canadian Pacific Railway, some 800 miles west of Winnipeg, you will find the whitened and bleached bones of thousands of these once noble and numerous animals. By the way, Mr. S. L. Bedson, Warden of the Provincial Penitentiary, a splendid and ardent sportsman and genial companion, is in possession of a herd of some twenty-five pure, full-grown and domesticated buffalo, which were, I believe, raised from calves captured by some Indian hunters while on the chase. They run at large on the prairie, mingle readily, and cross with our domestic cattle.

The country here consists of level prairie, for the most part, to the west intersected here and there with bluffs of poplar and magnificent lakes; also, in some places, with marshes, which are fairly alive with fowl, while on the farms and prairies are found prairie chickens in abundance, and on the bluffs rabbits without number. In the north and east it is heavily wooded with fine spruce and tamarack. The country east is very rocky, and contains valuable gold and iron mines, also scenery which is, I believe, unrivalled. The beautiful Lake of the Woods, surrounding the pretty City of Rat Portage, which is fast becoming a popular summer resort, will, we may rest assured, not remain long in obscurity, and the day is not far distant when people will flock in thousands to this place, bathe on the magnificent beaches, camp on the thousand islands and enjoy the splendid trout, bass, pickerel and pike fishing of which it affords an abundance. In the south the country is not so heavily wooded as in the east, and at or near the Souris River rich coal mines are now being developed, while railway construction is pushed forward rapidly in order to open up the country.

It is said by sportsmen, who certainly should know, that the Souris affords the best prairie chicken, deer and elk hunting they ever found. It certainly must afford the former, for a friend of mine, who is a very poor shot, recently bagged over seventy chickens in one day's hunt. Judging from this feat I should say a good sportsman could bag an unlimited quantity in the same space of time. The Manitoba prairie chicken is somewhat similar in appearance, though larger and has coarser feathers, than the pinnated grouse. They are found in countless numbers on the bare prairie, rarely, if ever, seeking cover, not even in winter, when they burrow in the snow and are very wild to approach, but in warm weather they will permit you to approach within twenty feet of them, while they are concealed in the long grass, before rising. With a good setter they afford splendid sport during September, October and November, and in my next I shall give you an account of some of my hunting excursions after them and other kinds of game in the "Great Lone Land." OJIBWAY.

WINNIPEG, Manitoba.

"TRIAL BY JURY."

Editor Forest and Stream:

In your issue of Jan. 17, an article appears headed "Trial by Jury." A week or two before that, in a short article the statement was made that the game laws as they stand at present were better than any that were likely to be passed by the Legislature at Albany. In this I fully concur, and as the article "Trial by Jury" has undoubtedly been read by thousands of sportsmen in this State who recognize FOREST AND STREAM as the standard authority in all such matters, I would like, with your permission, to endeavor to show that even in these cases, one of which is an extreme one, the law afforded ample protection. I am not a "country lawyer," but I believe that light penalties rigidly enforced are better than very heavy ones. During Governor Cornell's administration, as many of your readers will remember, a new game law was passed by both the Assembly and Senate, and was vetoed by the Governor on the ground that, as the violation of the law was only a misdemeanor, the fines and punishment were excessive.

Now, in the case of Murdock, the plaintiff was compelled to sue for trespass as the season was open, but he should have accepted the defendant's offer or tender of $2 and costs, which could not have been less than $1 50, his lawyer's fee was at least $5, for even in the country they seldom forget to charge. There was also the loss of his day to appear for trial, probably $2 more, which would make $10.50, and had he went to trial without making the tender, he would have been compelled to pay costs to the amount of nearly $4 instead of $1.50. As I said before, the plaintiff should have accepted the offer to settle and quietly waited for the next customer to be served the same way. He thinks he accomplished nothing; he will find that he has done more toward the protection of game in his section than he imagines. He has shown to this man that with a jury, no doubt reluctant to impose a heavy fine on a laboring man, they were still compelled by duty and the obligation of their oath to fine him. There are few people who like to be brought into court with the certainty of being beaten. In regard to the clergyman's case it was very simple. Instead of suing him for trespass, he should have been arrested for killing game out of season, the case proven, and the jury, by their oaths, would have been compelled to convict him; the law prescribes the penalty, and if the magistrate refused to impose it, he too became liable. JOHN H. DAVIS.

EAST CHESTER, Jan. 20.

[In this case the plaintiff's purpose was to test the law, not to punish the defendant.]

WINTER NOTES FROM MICHIGAN.

POOR Bob White is having a hard row to hoe hereabouts this winter. Not only has the thermometer had a disgusting habit of diving down under the zero mark for the last month or so, but the poor little quail have also been obliged to hunt hard for feed. The corn crop was nearly a total failure last year in this State, so the birds are dependent for their food upon rag weed and the grain that can be picked up along the railroad tracks. The crust upon the snow is a blessing to the birds just now, enabling them to run across it in their search for rag weeds. As for the grain cars, wouldn't it be quite a scheme to start a fashion among the bad boys of boring a hole here and there in every grain car they came across? I wish some one would set the thing going. And I think the augers wouldn't cost the boys much if applied for at the right place.

A great many rabbits have been killed during the winter in this vicinity. It is to be regretted that the use of ferrets is becoming more and more common. How different this boggish way of hunting the rodents and that portrayed by "Mark" in FOREST AND STREAM of Jan. 17.

Reports come down from the pineries that wolves are remarkably numerous this season. In Roscommon county especially they appear to have increased in numbers over previous years. Talking of wolves "reminds me" of one we shot some six or eight years since. We were walking along a "tote" road, when of a sudden one young hound bristled up and snuffed the air excitedly. Thinking he scented a deer we let him go, whereupon he bounded off eagerly and fiercely, and disappeared over the side of a slight ravine. In less than two minutes we heard a crackling of brush and made ready to shoot the expected deer, but were surprised at the sight of our heroic hound coming back to us at full speed, tail between his legs, and twenty yards behind, following hard after, was a large gray wolf. And when the wolf saw us for the first time not fifty yards away, what a surprised and foolish-looking wolf he was. He dropped on his haunches with a hang-dog, chop-fallen expression, and seemed to say: "Well! What an ass I have made of myself." He seemed to know that he was done for, and sat still until a .50-caliber ball tumbled him over.

A new organization in Detroit is "The Michigan Gun Club and Game Protective Society." The officers are as follows: E. H. Gillman, President; Al. Henkel, Vice President; H. Dunnebeck, Treasurer; B. Worcester, Secretary; U. G. Chilvers, F. A. Woods, L. N. Hilsendegen and Herman Bowman, Directors.

The Island Club, of East Saginaw, are planning to build this spring a club house, to cost some $7,000, upon Herriman's Island, in Saginaw Bay.

Fishing through the ice is now at its height upon nearly all the waters of our State. At St. Clair Flats, St. Ignace and, in fact, at places innumerable, immense numbers of large pike and other varieties of the finny tribe are speared daily, and is exciting and comfortable sport, sheltered as most of the fishermen are in a warm, portable little house, which protects them from wind and cold while they play their decoys and spear their victims.

Mr. J. B. Horton, of St. Paul, Minn., has been in Detroit for a day or so showing up to sportsmen a new hammerless gun, invented by Burkhard and Novotny, of St. Paul. I saw the gun taken apart and critically examined by several gentlemen, and it really embraced some new principles that would seem to make it a strong candidate for popular favor. As yet but five or six have been made. Mr. Horton is now on his way East for the purpose of introducing the gun. DELTA.

DETROIT, Jan. 26

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I have been very much interested in the ideas of my brother sportsmen in regard to a .40-90 repeater, and as I hunt large game four months in every year with a reasonable amount of success, I will give my opinion. I want a .40-90 repeater, Winchester preferred, if it can be made so that it will stand the work and be safe.

If after a thorough test, the manufacturers think a lever gun will not be safe, let them make a bolt repeater, with if possible, a set trigger, and I will be willing to pay what it is worth and try it. I use a .45-60 Winchester. It is a good gun, and I like it, but my hunting companion has got a .40-70, that he uses as a .40-75—pounds in 75 grains of powder. At from 75 to 125 yards I can kill as well as he can, but at 200 yards, more or less, I am not certain to get there, and he is; and I know it is not my fault, for I have tried his gun, and I can do as well as he can with it. But when it comes to game on the run, I can kill more than he can, because mine is a magazine and his is a single shot. Of course a .40-90 will be an experiment, but I am willing to help pay for it.

In regard to sights, I have tried pretty much all the new-fangled sights in the market, and have laid them all aside and gone back to plain open ones. I have half a dozen patent sights that are for sale cheap, for I shall never use them again.

I must say a few words in defense of the magazine guns, Winchester especially, in reply to "W. N. B.," in your issue of the 10th. I have carried a Winchester full of cartridges as a saddle gun since 1871. Ridden always with cartridges in it, and never had it to fail me but once, and then I had got a .45-caliber Colt's pistol cartridge into the chamber by accident. I have been in lots of tight places, and my Winchester has always pulled me through—and I have never had to climb a tree, just because the pump handle arrangement was so speedy. W. J. DIXON.

CIMARRON, Kansas.

I have been accused of heresy in some points relating to the rifle, and justly so if heresy be deliberately butting one's head against the stone wall of popular opinion. But heresy may well be pardoned if accompanied by no proselyting spirit. I think that not a line of mine can be found in which I have advised buying any particular rifle or in which I have said what was the best rifle. I have said what I preferred, but preferred only because I wanted immediate results and no cripples, thereby clearly implying that other rifles would be better for those who enjoy hunting up wounded game.

For several years I have had but one opinion as to the best hunting rifle, the best for general use and for average results over a long reach of time. And that opinion is this: That (for one who cares nothing about how many cripples he makes) the rapidity of fire of the repeater overbalances all its own defects and all the advantages of any other rifle.

Few who have read what I have heretofore written would suspect that nearly all the time I was writing against small-bores as being cruelly wasteful of game, I was using a repeater for small game, and sometimes (on account of its convenience) for deer. I have used only the Winchester models, but I presume all others made on that plan are as good or good enough. And looking back over the years that I have hunted with and without them, I have no hesitation in saying that, throwing the convenience of their cheap and easily obtainable ammunition, their strength and perfect working under the shabbiest treatment, and other points entirely out of consideration, their speed of fire—in the long run—overbalances all else. A few days, or even months of hunting may indicate other results, and many will disagree with me in this opinion. But, as Pindar well says, the rolling years are the wisest witnesses. A double rifle delivers its first two shots a trifle more quickly than the best repeater. But when I look down the long line that stretches back into the dawn of my rifle hunting, I can see hundreds of instances where the third and fourth shots were worth oh! so much, yet were just a second or two too late. And many, very many times, they would be too late even for a hammerless double rifle with automatic ejectors.

The ease of obtaining ammunition and the absence of all "traps" commends the Winchester to me more than any other point. I don't care for killing much game, as I kill nothing to sell or to throw away; but in traveling about as I do, it is a great relief to have no loading tools, powder, lead, ladle, etc., to carry with me.

The question of its accuracy is readily disposed of. I shall not discuss the muzzleloading question again. I expressly stated long ago that what I said about the muzzleloader was said only to induce makers to improve still further the breechloader. I think Maj. Merrill goes too far in saying that the muzzleloader is the best hunting rifle. He is driven to the other extreme by that absurd, unreasoning idolatry of the breechloader that denounces as an old fogy and a fool every one who does not drop on his knees and remain there in blind adoration. Game is now so wild that no slowly-loading rifle can be the best hunting rifle, even though it be a breechloader, much less if a muzzleloader.

But there is still another point that the most devout worshippers at the shrine of the breechloader have entirely overlooked. They have been too busy in abusing as old fogies, etc., men who used the breechloader all the time, and would use nothing else for hunting, yet had the wicked audacity to hunt for defects in the great idol in the hope that its maker might remedy them. That point is, that the Winchester, as now made, will do better average shooting than any muzzleloader will do, unless the muzzleloader is in the hands of one who is both careful and expert in loading it. The loading of a muzzleloader, so as to insure better work than the Winchester will now do with its factory ammunition, is one of the fine arts of shooting. Not only is much experiment necessary to find the exact diameter of bullet and the exact thickness and quality of patch—matters in which the rifle is more whimsical than an old granny—but care must be taken in loading at every shot. I can make any muzzleloader throw as many wild balls as any breechloader, yet any one not an expert, and a keen one at that, could watch me load it all day without discovering any difference in the loading. This is one reason why some muzzleloaders, taken from the corner where they have stood for years, to compete with the modern breechloader, have failed to show the accuracy that Major Merrill and others besides myself have ascribed to the muzzleloader in general. The "fitting" has been forgotten, and it would take a day or two of experiment to regain it. And perhaps even its importance has been forgotten or never was known.

The chances are, therefore, very great that the breechloader will excel the muzzleloader in ordinary hands. And

as nearly all the hands into which the hunting rifle ever finds its way are extremely ordinary (in respect to care and skill in such matters), the question of the superiority of the breechloader even for accuracy seems settled in its favor.

While on this subject I will give my method of getting muzzleloading accuracy from a breechloader, without using a ramrod, so that those, who, like Major Merrill and myself, admire supreme accuracy, may not feel that a screw breech pin is essential. This may not work with all rifles, but in those in which I have tried it the shooting is absolutely perfect.

Take a new and clean shell and cut a hole through the rear; but leaving the rim intact so that it can be readily extracted. Into the muzzle of this empty shell patch and insert any ball, round or long, just as you would into the muzzle of a muzzleloader, and put it into the gun. Then make a small ramrod half an inch or so longer than the shell, having a shoulder that will not allow it to pass beyond the mouth of the shell. With this ramrod push the bullet out of the shell into the grooves. Then pull out the shell and insert one loaded with powder and wad. If properly done this leaves ball and patch in exactly the same condition as if pushed down from the muzzle and left in the grooves, the sole cause of the muzzleloader's accuracy. You need have no fears of "air space" as it would in any event be too trifling for injury. The same care in fitting ball and patch must be observed here that is necessary for any muzzleloader, and if the powder is forming dry hard dirt, the lower part of the grooves should be wiped for two or three inches. In this way a rifle may be loaded more quickly than with a ramrod, and it can be done in the field whenever there is no haste. More powder may also in this way be used, and by pushing the ball still further into the barrel and inserting a paper cartridge of powder in front of the shell, express charges of any desired size may be speedily loaded.

The safety of repeaters I judge of as of the safety of all other guns. I never heard of an accident with any repeater that must be closed tight before it can be fired, as the later models of the Winchester must be. Excessive recoil might explode a cartridge in the magazine, but there need be no such recoil if we can only get clear of the idea that a rifle needs a bullet at least an inch long. It is length of lead that makes recoil. The repeaters have, no doubt, been tested at the factory with vastly heavier charges than they are ever called upon to stand, and if the danger were at all real we should before this have been furnished with some positive proof of it. Any kind of rifle is liable to burst. Within a mile of where I am writing a Remington rifle with a factory cartridge burst, a few years since, in the hands of one of my friends, blowing the barrel to pieces at the breech and nearly taking his head off. The rifle can be seen to-day in San Diego. There is no absolute safety with any kind of a gun light enough to fire from the shoulder. Judging from the number of repeaters in use, the length of time they have been in use and the trifling number of accidents we can hear of, I do not see any evidence that the action is not as safe as that of any of our double rifles or shotguns. Undoubtedly the Sharps action is stronger, but if the Winchester is strong enough it is better. It may be said that in a gun nothing is strong enough if it can be stronger. If you say—just as well be stronger—I agree. But no one prefers Sharps action for a shotgun because its additional safety is handicapped with clumsiness. We all prefer a weaker action because we deem it strong enough and much neater. If the Winchester could just as easily be made stronger I would prefer it so. But if additional clumsiness is to be the price of the extra safety, then I say it is now strong enough; by strong enough I mean for short bullets. I once had an old musket barrel that I tried to burst by increasing the powder charge. Even four ounces of powder behind an ounce of lead failed to shake it. Then I tried four bullets with about half an ounce of powder, and I never found anything but the forward end of the barrel. I have shot a double charge of powder in both the Winchester express and .45-60—loading as above described—and am not in the least afraid of them. With twice the weight of lead in them I should be shy of even 100 grains of powder. Five hundred grains of lead makes a very long bullet for a .40-caliber, and is about equal to five round bullet of the same caliber. A round ball in a 16-bore shotgun corresponds.

In a 16-bore shotgun the round ball weighs the same as an ounce of shot. Five times that amount of shot would soon use up the gun, even with a small charge of powder, and with a heavy charge would be apt to burst it. It is not probable that such a gun of ten pounds weight or under would be safe with five ounces of shot, with one-fourth of an ounce of powder behind it. And it is quite certain that no shoulder could endure it. This is a powder and lead proportion of only one to twenty and yet there is too much powder. And comparing it with other loads, we may find that the strain upon the gun follows increase of lead in more than geometrical ratio.

It is true that the rifle is much stronger than the shotgun. But it is no less true that whatever element of danger there may be is increased in almost the same proportion by increase of length in the ball.

There are other reasons, however, why I think the proposed 500-grain ball too heavy.

First—It will be entirely too slow and cannot be given a high velocity.

Second—It may give such recoil as to cause irregularity of shooting as the balance of the gun becomes changed by emptying the magazine.

The evils of low velocity are generally unnoticed except by trial. Take a Winchester .44-40-200, and sight it with globe sights to the center of an inch bullseye at 30 yards. Then fire it with the same sight at 100 yards and you will find the ball somewhere about nine inches below the mark. With such a rifle how much small game can you hit even between 50 and 150 yards without knowing its distance and changing the sighting accordingly? And if the variation will bother one on small game, why not on big game, when it is necessary to hit it in exact spots with solid balls, and always advisable to do so with any expansive ball? Suppose now the fall of nine inches at 100 yards could, by increase of speed in the ball, be reduced to two inches. Do you see any greater improvement that could be made in the rifle?

The alteration of the ball's course by recoil is unsuspected by many. I treated this question thoroughly in these columns some six years ago. Suffice it now to say that if there be any considerable recoil about the rifle the ball will not leave it on the line of the axis of the bore formed at the time of pulling the trigger. It will be thrown off to one side in double rifles, and downward generally in single rifles—always downward if the barrel be long. In good rifles this deflection by recoil is so regular that the accuracy is not impaired in the least, although the rifle may be pointed so far off the mark that you cannot see it by looking through the bore when aimed for firing. It is scarcely necessary to add that where recoil is sufficient to require the axis of the bore to be turned off the mark—as would almost certainly be the case in a .40-90-500 of ordinary weight and length—a change in the balance of the gun from shot to shot might cause irregular deflection of the bullet. T. S. VAN DYKE.

CALIFORNIA.

Editor Forest and Stream:

I notice a correspondent in your issue of Dec. 27, advocates a 12-bore rifle for shooting grizzly bears. In India, double rifles of this caliber are very much used for dangerous game, though lately the .577-caliber express, a very powerful weapon of about the same weight, has come into favor, and has to a great extent superseded the lighter 12-bores, having a greater muzzle velocity and flatter trajectory, with great penetration and smashing power when used with solid bullets. Its charge varies from five to seven drams, and the usual hollow-fronted ball is 480 grains, but some are 50 or 60 grains heavier. The usual weight of the rifle is from 10 to 12 pounds.

The 12-bores built during the last few years, being mostly intended as special rifles for use against very dangerous game, have been made as powerful as this caliber and the powers of endurance of the sportsmen will allow, and carry from six to eight drams powder with a spherical ball. They weigh from 11 to 13 pounds, and if fitted with anti-recoil heel-plates, their recoil is not inconvenient. They can also take a short blunt-pointed conical bullet, which is generally of hardened lead when great penetration is required, as in the case of tough-skinned or heavy-boned animals, but as this ball is heavier than the spherical, a little less powder has to be used. Explosive shells are also sometimes used; a bullet of this caliber can take a good charge of explosive powder, which is generally composed of chlorate of potash and sulphate of antimony in equal parts by weight, the ingredients being ground into powder separately and mixed dry, a little at time, with the feather of a quill on a clean plate or piece of glass. Explosive bullets loaded with this mixture are perfectly safe to carry about and will stand rough handling without danger. Any hollow-pointed bullet can be made explosive by being filled with this mixture, the mouth being closed with wax.

Another variety of explosive bullet which carries a heavier explosive charge, is used in India; it carries the explosive in a copper core, which is held in position in the mold, on the bullet being cast, by the plunger, the withdrawal of which leaves a hole by which the explosive can be introduced—this hole is closed with wax or a shot pellet jammed in. Bottle-shaped cores are used for conical bullets, and spherical cores for spherical bullets, which are generally used with smooth-bore shotguns.

Opinion varies a good deal among Indian sportsmen as to the efficacy of these explosive balls. They are apt to explode at or near the surface of an animal's body or on a bone just under the skin, where they do not, of course, prove fatal, but when they penetrate well before exploding, they are very deadly.

Your correspondent's remark as to the incorrect sighting of English express rifles is very true, though it does not apply to the rifles turned out by the best makers. The high shooting of some English rifles at medium sporting ranges, though no doubt sometimes caused by an attempt to obtain an apparently long flat trajectory, is also due to the fact that some makers sight their rifles for the aim to be taken with the bead of the fore sight below the object instead of on it. This can be remedied by cutting the notch of the back sight deeper or by having the fore sight raised. These points should be attended to in ordering a rifle. Another very common fault of double rifles of the cheaper makes is that the two barrels do not shoot exactly alike with the same sight, one sometimes throws higher or lower than the other, and this is a very bad fault. Sometimes the shots from the two barrels cross one another, the right barrel usually throwing to the left and the left barrel to the right of the object fired at; this is not such a grave fault, but rifles can be made to shoot exactly alike with both barrels at all sporting ranges if enough trouble is taken by the makers in adjusting the barrels. This putting together the barrels correctly takes time and labor, and is the chief reason for the great cost of good double rifles. Double rifles should have back action locks; bar locks require the action to be much cut away and weakened to allow the main spring to be fitted. For heavy charges a double grip lever under the guard, with some good kind of top fastening in addition, is the best; the strain on the breech of a double rifle is much greater than in a shotgun. There is no doubt that a good double large bore rifle is the best weapon yet known for large and dangerous game.

BENGAL SEPOY.

LONDON, England.

Editor Forest and Stream:

I can readily understand why "W. N. B." should have such a prejudice against the present spiral spring magazine arms, or those arms with a magazine that permits the point of one bullet to rest against the primer of the one next in front. His experience is but the repetition of many others with the addition of frequent premature explosions caused by the point of the bullet striking the primer in front.

While seeking an effective arm, we should not lose sight of the fact that the first thing to be considered in a repeating arm is the safety of the magazine. It should be so constructed that the points of the bullets cannot strike the primer of the cartridge in front, either from the recoil or jostling on horseback. Unless your magazine is so constructed you are in danger from premature explosions; also the points of the bullets are so jammed that it is not possible to make a target with them, and in this jammed condition are liable to stop the working of the arm by sticking the chamber or corner block

There is but one repeating arm that embodies all the points required in a safe repeater, and that is the Chaffee-Reece repeating arm, which is now being manufactured at the National Armory, Springfield, Mass., by the Government for trial by the troops in the field. This is a .45-70-500, and has successfully passed through all the trials and tests that could be invented by an ingenious board of officers. The magazine of this arm is so constructed that each cartridge is held separate from the other by notched bars, and so locked that it is impossible for one cartridge to strike against the one in front of it from any cause whatever. This not only makes the arm safe but it also preserves the shape of the bullet and renders it suitable for target practice. If the zinc-pointed bullet suggested by Gen. Jacobs, of the Honorable East India Company's service, should be called into use, of all the magazine guns now before the public the Chaffee-Reece would be the only one that could safely use them.

The great objection to a .40-90 repeater is the length of cartridge it would require. A .40-caliber straight shell with 90 grains powder and a bullet crimped in, as in the Government cartridge, would be 3.40 inches in length or .52 inch longer than the entire length of the Government cartridge; the front end of the bullet projecting .60 inch beyond the end of the shell would give us a cartridge 4 inches long, which would be 1.12 inches longer than the Goverment cartridge.

This cartridge could be made shorter by the use of a bottle-shaped shell; but this is a thing of the past, it having been tried by the Government and long-range shooters and discarded; the straight shell is better for accurate shooting.

A repeating arm with the lever system for the use of the Government .45-caliber cartridge 2.56 inches long, required the receiver to be about 10 inches long. To use the .40-90 cartridge would add 1.40 inches to the length of cartridge, which of necessity would increase the length of the receiver, which would look to be about as long as the barrel, also requiring the lever to describe two-thirds of a circle to extract the shell and place a new cartridge in the chamber.

The change to a .40-90 repeater seems to have been suggested for the purpose of getting greater range and penetration. For the benefit of those interested in rifle shooting I desire to say that a .45-caliber 500-grain bullet with a charge of 80 grains of Hazard's F. G. powder, shot from a 32-inch barrel, will reach a target at a distance of 3,500 yards and kill. This is the record made by R. T. Hare, Government expert, while experimenting at Sandy Hook, N. J., to determine the extreme range of the Springfield and Martini-Henry rifles and carbines with their ammunition. The extreme range of the Martini-Henry rifle was found to be 3,200 yards; at a distance of 3,500 yards the 500-grain bullet went through the target, which was made of three thicknesses of one-inch spruce boards, and down into the sand on the beach eight inches. Is this not range and penetration enough to satisfy any one? To shoot this distance the angle of elevation was about 22°, the height of trajectory for the Martini-Henry at a distance of 3,200 yards with its 480-grain bullet was 2,700 feet, and for the Government 500-grain bullet at 3,500 yards about 2,800 feet.

A repeating or magazine arm is not only required to be a rapid repeater, but it must be a rapid single-shooter, admitting that the lever repeating magazine guns are rapid repeaters. At the same time we must admit that they are very slow single-shooters. The bolt magazine guns are the fastest single-shooters and they are very rapid repeaters, the Chaffee-Reece being able to fire eight shots in five seconds. The bolt system is conceded to be much stronger than the lever system. The repeating arm that is bound to win is the one that has a safe magazine. J.

SPRINGFIELD, Ill.

Editor Forest and Stream:

I concur fully with your correspondent "W. N. B." in his views respecting the relative merits of the magazine and hand breech-loading rifle. The fewer the parts and less intricate the apparatus, whether it be a watch or a gun, the less liable it is to derangement. Safety, efficiency and simplicity constitute, in my opinion, the chief essentials in the mechanism of the arrangement for loading at the breech, and these I think are fully embraced in the Remington rifle. But in the communications which have so far appeared upon the subject of sporting rifles, the fact appears to be ignored, if not entirely lost sight of, that the grizzly bear and Apache Indians are not the game of this country. There are few sportsmen who have either the opportunity or inclination to indulge in an encounter with that kind of game, and for strictly sporting purposes the necessity of an arm of large caliber and extreme range with heavy charges of powder and lead may be regarded as exceptional. The essentials for convenient loading at the breech being attained, absolute reliability in the accurate shooting at what, in the present target practice is called short range, must be afforded to give any value whatever to the improved rifle over the muzzle-loader for ordinary sporting purposes.

Thirty years ago with a muzzle-loading rifle made by James Doherty, of Petersburg, Va., I placed twelve shots successively in a one-inch bullseye at eighty yards with a standing rest, the shots forming one hole vertically across the center. At 200 yards, with a reclining rest, I could put all of my shots in a two-inch bullseye. This was the extreme limit in distance of my target practice at that day. The twist in this rifle increased from the breech to the muzzle; the bore was about .38-caliber and was loaded with a round ball and linen patch. From 200 to 300 yards every ball ought to be shot inside of a 2-inch circle. A hunter of tact can always get within that distance of his game, and a round ball of .38-caliber is ample, if put in the right place, to bring down the hardiest buck. Has the increasing twist been applied to any of our breech-loaders for imparting the rotary motion gradually to the ball as it leaves the gun, and has the round ball been tried for distances up to 300 yards in breech-loading rifles? There would be less powder required, less concussion and greater steadiness would ensue, and I think less liability to deflection with the round than with the elongated ball, it being more likely to preserve its rotary motion around the axis of its direction. I am making some experiments with a Remington .32-caliber to test the relative accuracy of the round and elongated ball at from one to 200 yards, and would like to know if any conclusive facts in this respect, and in regard to the adaptation of the increasing twist to breechloaders, have been already gathered by our rifle make and rifle shots. H. H.

PENNSACOLA, Fla.

KANSAS.—Independence, Jan. 20.—*Editor Forest and Stream:* Having been a constant reader of your valuable paper since the first of 1876, I thought I might venture to write you a word of the sporting prospects here. Chickens or pinnated grouse are here in some numbers, but the greedy market hunter and the prairie fires have very much lessened their numbers, though good shooting may be had in season within a day's drive of our town. "Bob Whites" are in abundance on every hand. I have known a party of two to go out for a three days' shoot and come in with 208 birds and 9 chickens. Bags of 40 and 50 birds are quite frequent among the practical shooters. The great opportunity here for sport is south, in the Indian Nation, where there is abundance of deer and turkey, besides small game, but the Indian is getting quite jealous of having his game destroyed, so that the sportsman is liable to get into trouble unless he has native friends with him.—JUDGE. ["Judge" can hardly blame the Indians for resenting the encroachment of game trespassers on their reservation.]

NEW ORLEANS, Jan. 22.—Last night a meeting of the hunters who are to participate in the annual hunt for a game dinner was held at the store of Cardona & Hunt, for the purpose of selecting teams for the shoot. Messrs. E. T. Manning and A. M. Aucoin were elected captains, and the teams selected are as follows: No. 1—Captain A. M. Aucoin, F. A. Cousin, Paul Chaudet, J. V. Guillotte, Martin Huber, Louis Cook, Emile Dupre, John Stumpf, J. V. Leveque, George Lessasier, Rene Sarrazin, E. Wash. Vinet, Albert P. Noll, Dr. W. H. Watkins, Walter Saxon, William A. Davis, Wm. Dupre. No. 2—Captain E. T. Manning, John K. Renaud, N. D. Wallace, Richard Frotscher, A. E. Livaudais, A. S. Ranlett, C. H. Wood, C. J. Lewis, A. Cardona, Jr., J. H. Maury, W. T. Coleman, Captain Octave F. Vallette, Thos. McGinty, J. C. Lyons, Jr., Wallace Wood, John R. Kent, Chris. Collins. The list of names of those to participate in the hunt will be kept open until Thursday next, and those who present themselves will be chosen by the captains of the teams. The hunt will take place on Saturday and Sunday, the 26th and 27th, and the annual dinner on Tuesday, the 29th. The points to govern the hunt are as follows: Robins, 1; doves, 2; snipe, 8; quail, 10; mallard duck, 15; other ducks, 10; squirrels, 10; rabbits, 10; hawks or owls, 25; woodcock, 25; prairie chickens, 30; geese, 50; turkeys, 250; deer, 500; bear, 1,000.

BROOKLYN, Jan. 21.—*Editor Forest and Stream:* I have been a reader of your paper for the past eight years, and have always read with great interest any communications on the subject of hunting rifles. I never had the time to go where I could hunt large game, but have had some very fine sport with squirrels, using a .22-caliber Ballard, but it is a little too small for foxes or woodchucks. I think it is very good sport to wait for a fox that the dogs have started and shoot at him with a rifle as he goes by, so when I read in your issue of Jan. 3 that a rifle of .25-caliber was going to be put on the market I made up my mind to have one. I also spoke to a friend and he told me to let him know when it was ready and he would go and get one with me. Now I would like to suggest one thing to the makers, and that is that they put a ramrod under the barrel. I do not think it would cost much more, and I for one would be willing to pay for it. Then we could put a primed shell in the gun and load from the muzzle if we wanted to, and it would be so handy for a cleaning rod. Let us hear from others.—MORO.

PENNSYLVANIA MARKET.—Williamsport, Pa., Jan. 21.—*Editor Forest and Stream:* There exists in this county, Lycoming, a noted organization called the Lycoming County Sportsmen's Association, which was established for the protection of game. Last Saturday I noticed hanging on poles in the market, large bunches of quail, grouse and rabbits, which were evidently killed after the first of January. This is certainly a flagrant violation of the law of this State, so far as it relates to the capture and sale of wild game. Do you know whether this town has any game wardens? If such officers are to be found here they should certainly be stirred to a performance of their duty, since the society referred to above seems to be dead to the interests of those matters which most pertain to it. I saw a jack rabbit the other day, sent to a gentleman here in town, from Akron, Ohio. Does this species of rabbits abound so far east as Ohio? —W. K. M. [We do not know whether Williamsport has a game warden or not, but possibly by inquiry our correspondent could find out. The jack rabbit is not found in Ohio.]

THAT IOWA SIDE-HUNT.—Decorah, Ia., Jan. 21.—*Editor Forest and Stream:* I see an account in your columns of a side-hunt, held at Rippey, Ia., Dec. 20. "Wild Doc" complains of game being scarce around there. No wonder, with such law-abiding citizens, or sportsmen, as they may call themselves. If they were to look at the game laws of the State they would find that it is unlawful to shoot prairie chickens after Dec. 1, and yet on Dec. 28 "Wild Doc" and his party of twenty-one men on each side go out to shoot them; and, worse still, he proposes to have the shoot over again in the spring, at which time all the birds will have mated. It seems strange, when we have game laws in the State, that "Wild Doc" and his party cannot be restrained from breaking them. He not only breaks them, but openly publishes the account afterward. Where Rippey is I do not know, but only wish it were near this part of the State, as then I guarantee we would make it hot for "Wild Doc" and his party.—FAIR PLAY.

BLACK BRANT ON THE ATLANTIC COAST.—I have learned of what I suppose to have been two black brant (*Brenta nigricans*) that were killed in Tuckerton Bay this winter. It was here that Cassin secured two of the specimens he writes about when he describes the variety. I did not learn the name of the gunner who shot them, but imagine he was a Parkertown bayman. I hear also that a more than usual number of white-fronted geese (*Anser albifrons*) have been seen passing over these waters, but none stopped in them. Will not Mr. Van Dyke who wrote of what he thought, and possibly might have been, black brant on the Pacific side, let us hear from him in reference to what he has further learned of this bird, and if possible forward the promised specimen. Brant have been very plentiful on our Atlantic coast this year, but each year they seem to be getting wilder and wilder and more difficult to stool. —HOMO.

RABBIT SHOOTING WITH PISTOLS.—My experience in revolver shooting will cover a space of fifteen years and I never could find one in all that time that wouldn't overshoot at short range, and to remedy that have had to take out the front sight and replace it with a higher one. Why wouldn't it be better for both the manufacturer and the buyer if the pistols were sighted so that if a man wanted to hit anything from ten to fifteen yards off he would not have to aim from six to twelve inches under. In order to do good shooting with a pistol it has to be sighted so that the object to be hit can be directly aimed at.—W. F. C. (Saco, Me.)

FELIS DOMESTICUS ONCE MORE.—*P. S.*—I neglected to write the P. S. to my Philadelphia cat story last week, just as my friend neglected to tell it to me until I had expressed my surprise. Upon careful investigation he found that the Tom which he had killed (cutting off his tail in the process) and buried was not his own, but that of his neighbor. His own cat had been away on a visit for two weeks and so had escaped a tragic end. Now let "Reignolds" stand up and tell the "postscript" to his story; we all know there is one. —M.

HE CAN CALL WOODCOCK.—Dyersburg, Tenn., Jan. 22.—Robins have made their appearance in considerable numbers at this place; very few snipe yet. Nat Tarrant, the sheriff of this county, and Rome Ferrell killed 130 quail in one day recently. They had only one dog to shot over, and one man to carry game. Mr. Tarrant is the best shot and best hunter in the State, and can imitate the notes of any bird, or the barking of squirrels, etc., etc. He tells me that he has caught young woodcock on the snow in March, and he can imitate the occasional note of a woodcock, or the guttural sound that is produced by them in spring. He has watched them by the hour in the plowed ground in the early morning or late evening, and is standard authority in this section on hunting and fishing. He has caught 'possums lately that dressed fifteen pounds.—T. L. W.

COWEENS IN THE NIAGARA.—Buffalo, Jan. 20.—Large numbers of cowcens and whistlers are wintering with us on Niagara River, and they afford considerable sport to those hardy enough to endure the cold. The fall duck shooting has been very good, being the best we have had for several years. We are waiting patiently for the reappearance of the ducks in the spring. Several days ago I noticed a bevy of a dozen or more quail across the river, the first I have ever seen in this vicinity. The State Sportsmen's Association will hold its next annual meeting in this city. The Audubon Club have the arrangements in charge, and it is expected that some of the best shots in the State will be present. The club will hold a meeting Feb. 1.—W. A. A.

RAPID MANEUVERING.—Lieut.-Col. Mabee and I were beating through very thick woods, being about 200 yards apart, but out of sight of each other, and working the Colonel's setter between us, when suddenly, with a whirl and a buzz like a St. Catharine's wheel, I received a smart blow on the forehead, knocking my hat off and causing me to stagger back a pace or so, more with astonishment than concussion. I did not wait long to take in the situation and circumstance, knowing full well that a partridge or "ruffed grouse" had flown in my face and was again "winging his way." I turned, fired and killed the bird before it had time to disappear even in those thick woods. Rather peculiar, but—VERAX (Port Rowan).

WHITE-BREASTED BEARS.—Fort Dodge, Jan. 18, 1884.—*Editor Forest and Stream:* In your issue of Jan. 10 you ask for further hints as regards the belief among hunters that a black bear with a white spot on the breast is more dangerous than those not having this mark. I once had an old hunter in Florida tell me that a bear with a white spot on the breast was the most dangerous of all the wild animals on the peninsula, the panther not excepted. I have also heard this belief spoken of among old hunters in parts of New Jersey.—H. E.

A FLORIDA WEST COAST RESORT.—Manchester, N. H., Jan. 23.—*Editor Forest and Stream:* If "G. G. F.," Cincinnati, desires good hunting and fishing, plain living, no "fuss and feathers," he can get it at Crystal River, Hernando county, reached by small vessels from Cedar Keys, which make trips two or three times a week. He could probably get boarded at E. R. Kings, a farmer, with whom I boarded some years ago.—A. B. D.

KANSAS—Independence.—We have very little of my favorite sport here (that is fishing), though we have some bass of the green or striped kind, here called black bass. I have caught some nice strings of them in the past season, running in weight from ½ to 4 pounds. We catch a good many catfish, some eels, and the market fishermen with their nets catch an abundance of buffalo, and others of the sucker family.—JUDGE.

REBOUNDING LOCKS.—Long Island City, N. Y., Jan. 24. —*Editor Forest and Stream:* After reading the communication in last week's issue, I tried the locks of my gun, a 12-gauge, bought a year ago, and found that if I raised the hammers almost to full cock and let them go they would sometimes strike and explode the caps. The hammers would not strike the plunger unless at as near half-cock as it would go.—TIP.

Sea and River Fishing.

BIG LAND-LOCKED SALMON.

ONE morning early in December as Messrs. J. L. Mayberry and W. P. Farr were hunting partridges in the woods bordering upon Rodgers's Brook, in Bridgton, Me., they met with the material for a fish story of unusual interest. Just above the first rapids in the stream, and but a few rods from where it flows into Long Lake, they found a "black spot" trout, or land-locked salmon. The fish, left there by a sudden fall in the water, had evidently been dead for several hours, and was only partly covered by the water, which was here but a few inches deep. The gentlemen took the specimen and carried it to the residence of Fish Guardian J. Mead. It was found that this fish measured thirty-eight inches in length, nine in depth, and weighed twenty-five pounds—proportions that considerably exceed those of any specimen of which there is an authentic account, at least in these waters. The hook on the under jaw of this fish was fully an inch and a half in length, and strong and hooked enough so that the fish was hung upon a stake by it and carried to Mr. Mead's, a distance of nearly a mile. This hook, which terminates the lower jaw, and, in this specimen, passed into and through an opening in the upper jaw, it is said, is fully developed only at breeding time. It then acts as an effectual muzzle, and prevents the wholesale slaughter which would be sure to result from the fierce battles between the males of this and every member of the trout family. The celebrated eleven-pound "red-spotted" trout in the possession of Prof. Baird, of the Smithsonian Institution, has this hooked jaw in a very marked degree. It was taken off the spawning beds at Nupper Dam, Androscoggin Lake, the last day of September, 1880, and is the largest specimen on record of that species of trout, the *Salmo fontinalis*.

Mr. Mead has in his possession an ancient sign which is a representation of a land-locked salmon, and is stated to be an exact model of a specimen taken from these waters half a century ago. This sign fish is forty inches long and nearly ten inches deep, and it is said that the fish from which it was modeled weighed thirty-five pounds. Hardly any one has believed the sign fish story until the finding of the fish mentioned above, owing to the formidable proportions, hooked jaws and other features which appeared to be monstrosities in the sign model. But placing the fish lately found and the sign side by side, it is seen at once that the sign is a faithful model of a fish, only a little larger.

The fish in Mr. Mead's possession has attracted a large number of visitors, and has awakened a renewed interest for the protection of these noble inhabitants of the mountain lakes from the havoc which is made among them by sneaking poachers, at breeding time. So plenty were these fish formerly in the waters of Sebago and Long Lakes that some of the older residents tell of canoe loads being taken in a very short time. An old gentleman of eighty years says that, when a boy, he and a companion captured two barrels of land-locked salmon during the time that a third member of their party was collecting wood and making a fire to cook their suppers. The untimely war waged upon them at breeding time had nearly depleted these waters a few years ago; but the protection afforded by the statute laws has already worked a marked change, and there is no question but that the fish are rapidly multiplying. In proof may be mentioned the noble specimen mentioned in the *Herald* the other day and the one above. Besides, a gentleman writing from Portland last week gives another account of a land-locked salmon, found stranded on the banks of the same Rodgers's Brook on Tuesday, which measured 27 inches in length and weighed 22½ pounds. The gentleman thinks that when first out of the water it must have weighed at least 30 pounds. It is evident that the fish, weak from terrible exertions in ascending the little stream to breed, were stranded by the sudden fall of the water after the rain of Monday.—*Boston Herald.*

TROUTING ON THE BIGOSH.

A TALK WITH JACK.

AFTER the party went out to initiate the Colonel into the mystery of lake ranges, and the Doctor into the capture of lake trout, Jack and I went along the shore to find an inlet which Uncle Ben said did not exist. I had, on several occasions, seen a line of fog above the swamp on the west shore of the lake, in the morning, and felt sure that it indicated a stream of water, so, with our wading boots, hatchet, landing-net lined with mosquito bar, and a preserve jar filled with alcohol and slung in a net, we started. Coming to a small spring stream, flowing into the lake from the hills which rose high on this side, we put the net below some stones in it and then lifted them.

"Lobsters," said Jack.

"They are not lobsters," I answered, "but crawfish, or crayfish, as the older name was."

"If that isn't a little lobster, then I don't know one when I see it. You may call it a crawfish, because it lives in fresh water and never gets large. There are the big claws and the other eight pairs of legs, head, tail, and all. I'd like to know why it is not a genuine fresh-water lobster?"

"Jack, things are not always what they seem. This animal differs from the lobsters in several important points, and, although closely related to the lobster, it is as distinct as a panther is from a lion, or as a trout is from a salmon. One of its differences is that in the crawfish their young when hatched are perfectly formed and cling to the tail of the old one. See here! this one has young now hanging on to the appendages under the abdomen or tail. The egg of a lobster hatches out a larval form that does not appear a bit like its parents. Save these alive, we may want them for bait if we conclude to try other kinds of fishing to see what is in the lake."

"What are these other things?"

"These long stick-like things, and the tubes made of small snail shells are the cases of what are called caddis worms. They are larvæ of a large fly which is about the water and on which trout feed; put them back in the water. This dirty-looking grub is the larva of a very destructive water-beetle; put it in the alcohol, it is not often that we find the larva of this beetle on the hillside; it is usually in ponds, where we also find the young of the dragon fly. Let us go on and keep as near the edge of the lake as the boulders and fallen timber will allow. If we had a boat we could explore to better advantage, yet Uncle Ben has been over the lake, both in boats and on the ice, and declares that there is no inlet in the swamp, but that the lake is entirely fed by springs. If this is so then my fog-line theory amounts to nothing."

"Look there," said Jack, pointing at a crow on a dead limb a short distance ahead, how I wish I had a gun."

"And I am glad that you haven't. Why do you wish to kill that poor crow? He has never harmed you and is of no use if you had it. Never kill anything that you do not want unless it is liable to injure you in some way. If you want to shoot you can learn to have as much pleasure in hitting inanimate objects as in taking life. I tell you what it is, Jack, in this free country of ours there is too much freedom for men and boys to roam about with guns shooting robins, song birds, and harmless things. There is hardly a spot within ten miles of any city or village, where one can sit and observe wood life, because all that has not been killed has learned wisdom and keeps out of sight. Not one idle fellow in a hundred, who had a gun in his hand, would pass a rabbit, squirrel, woodpecker, or even a little chipmunk in summer, when they have young dependent upon them, without shooting it. Now I beg that you will pass the poor crow when out gunning, and will confine yourself to legitimate game."

"But," said Jack, "the crow pulls the farmer's corn and carries off his young chickens, and is a nuisance, anyhow."

"Then let the farmer shoot him, if he will, but as you have neither chickens nor corn, I don't see why you should trouble yourself about the matter. There are plenty of worms boring into the farmer's apple trees, but you do not go around probing their holes with a wire to kill them. Your excuse is a poor one, and as to the question of the crow being a nuisance, there are two sides to that. The crow could show you a list of grubs, cut worms, etc., that he destroys, which might balance his account. I think, Jack, that you only try to excuse your natural desire to kill, and this desire seems an instinct born with man and only eliminated with age or education, which in this sense may be synonymous. Now watch that crow! See, it has something in its mouth, and there it goes across the lake into that tall pine where perhaps may be a nest with young ones that will greet the coming of their mother with open mouths. Had you killed the old one there might have been starvation in the now happy family in yonder pine. There runs a little 'teeter-snipe' along the beach, there is no reason to kill it, certainly it is a beautiful object, and its life lends a charm to nature. I can conceive of nothing more desolate than

these woods without animal life. Of course there are certain kinds of this life which are recognized as game, and the lawful killing of which, in season, cannot be objected to, but to kill a nesting bird should be a heinous offense."

"Well," replied Jack, "what you say may be true, but it is a sore temptation when a quail rises before you while shooting woodcock in summer, and I think that if I don't kill it some one else will."

"Now, Jack, that is no excuse at all. What would you think of a man who saw another asleep on the road and said that if he did not rob him of his watch and pocket-book some one else would. Never mind what others might or might not do. Do what you know or believe to be right and you will have no cause to regret having passed by the quail in the forbidden season, even though you know that some pot-hunter will bag it inside of an hour."

"This," said Jack, "is a new way to look at it. Father always told me not to kill certain things at certain seasons, but he never took the trouble to explain why. I will never again shoot a crow, nor a bird during the breeding season. Here is the edge of the swamp, but there is no inlet to be seen. What shall we do, go back?"

"No, we have wading boots, let's change our shoes for them and go in. Leave everything here except a creel and the landing-net, and we will see what the swamp looks like."

In half an hour we had penetrated the swamp by wading, going around deep places, climbing over fallen trees, and dodging under vines and limbs, and then we struck a fine stream, which yielded small shiners and chubs to our landing-net, and we saw evidences of trout that we knew would gladden the Doctor's heart, for he was a wading fisherman, who only fished the Bigosh from a boat because there was no other way to do it. With a good collection of Cyprinoids, for which Jack said I could lie awake all night inventing jaw-twisting names, of which neither I nor any other man knew the meaning, we returned to camp to hear how the Doctor had succeeded in getting a lesson in fishing for lake trout and how the Colonel had found the ranges.

FRED MATHER.

EELS DEVOURED THE TROUT.—The Hartford, Conn., *Times* says: "In the middle reservoir, at West Hartford—one of the reservoirs which supply the city with water—were placed several years ago 13,000 young trout and 1,000 land-locked salmon. Mr. J. G. Lane contributed 5,000 trout, and Mr. J. Holcomb as many more. The salmon, we believe, were put in by the fish commissioners. Occasionally some lucky fisherman has landed a nice trout from this reservoir, but the catch was not commensurate with the expectations, and it was surmised that the trout and salmon families were becoming depopulated by some agency besides the hook and line. When the reservoir was drawn off a discouraging state of things was revealed to those who had advocated the feasibility of stocking the reservoir with trout and salmon. Not a salmon was found and only about one hundred trout could be discovered. But there were twenty bushels of shiners, the size of one's fingers, and a few carp weighing half a pound, and also thirty eels of large size, but no small ones to speak of. The eels as they were killed and stretched out upon the bank, side by side, were a sight to look at. None of them were less than three feet in length and three inches in diameter, while the largest was 45 inches in length and plump 3¼ inches in diameter. The man who attempted to strangle the large one with his naked hands was subjected to a very lively shaking up, and he was willing to let out the job long before the lively eel showed any signs of yielding. Now the supposition is that the eels had trout and salmon diet until these fish were nearly exterminated, and the few that escaped had grown out of their reach and were able to take care of themselves. After the trout and salmon had tickled the epicurean palates of their enemies, till no more could be gathered in for the sacrifice, we are at liberty to guess that shiner diet was not ignored by the greedy eel, though their number would indicate that they had not been seriously thinned out. President Clark, of the water board, put into the big Farmington reservoir, last fall, about one hundred German carp, and as nothing has been seen of any of them since, he is of the opinion that they may also have become rations to some rapacious bigger fish. But he may be wrong, as this reservoir is so large that one hundred little fish could easily keep out of the way for a few months. Mr. Clark proposes to get some more of these carp and keep them by themselves in some running stream until they become large enough to take care of themselves and then put them into the reservoir and watch results. The German carp grow to be of large size—some weighing as high as seventy pounds. They take on weight at the rate of three pounds a year. Another thing. Of the trout caught in the reservoir after it had been drawn off, the largest ones were not fit to eat, while the half-pounders were equal in flavor and taste to the nicest brook trout."

EXHIBITION OF FISH.—At the second annual display of the New York Fanciers' Club, held at Madison Square Garden during the past week there was a fine exhibit of fish and fishculture. Mr. E. G. Blackford had an array of tanks and hatching jars which contained black bass, carp, tench and gudgeons from France, goldfish, catfish, axolotls, crayfish, terrapins, gars, sea anemones, eggs of whitefish from Michigan, and fry and eggs of brook trout. The South Side Sportsmen's Club of Long Island, exhibited rainbow trout of from half a pound up to three pounds weight, brook trout, salmon and land-locked salmon of fair size. This display of fish, in charge of Prof. H. J. Rice, was one of the principal features of the exhibition and held the crowd longer than any other feature.

UNIFORM NUMBERS FOR HOOKS.—We notice from FOREST AND STREAM that American anglers are agitating to get their rod makers to adopt one uniform size for winch plates. It would be very desirable for our English rod makers to adopt some uniform size. The present system of making the fastenings of different sizes causes the angler an endless amount of entirely unnecessary worry, while it does not add one farthing to the profit of the maker, in fact, the reverse, for an angler frequently declines to purchase a winch he has taken a fancy to when he finds it will not fit his rods. In the same way the present bewildering system of numbering hooks is of no advantage to the makers; indeed, it only gives them and their customers an endless amount of unnecessary trouble. Why should there not be as much certainty of getting what you want when ordering hooks as when ordering a gun or cartridges? We are certain that the sporting papers and anglers generally will warmly support any combined action of the trade for the purpose of establishing a uniform size for winch fastenings, and a uniform numbering of hooks. We would gladly aid our manufacturers by giving illustrations, drawn to scale, of any standards that might be decided upon. We recommend these suggestions to the attention of the hook makers of Redditch and Kendal, and of manufacturers of rods and lines generally. They could not show their known willingness to please those for whose use they make their goods better than by remedying a long-felt grievance—one which has been complained of by every angler and angling writer.—*London Fishing Gazette.*

PICKEREL FISHING THROUGH THE ICE.—Saco, Me.—*Editor Forest and Stream:* A party of four of us spent five days on the Parsonfield Pond and had fair success with the pickerel. We cut holes in the ice, but the first two days were too cold to fish. The third day was better and we took several fine fish. One of our pickerel weighed five and a half pounds, and measured twenty-seven inches in length, and an eel was taken that was twenty-eight inches long. In all we took twenty-eight pickerel.—W. F. C.

CANADIAN SALMON RIVERS are advertised for lease, in our advertising pages.

Fishculture.

FOOD OF TROUT.

I AM in receipt of the proceedings of the American Fishcultural Association, at their meeting last June. I notice that the discussions partook largely on food for fish. This is an important subject in artificial fishculture, and has been heretofore somewhat overlooked. We might as well expect John Bull to go without his roast beef, as a fish to live and be in good condition, without an abundance of good food, and such food as is suited to its wants. Some fish feed largely on crustaceans, some on small fish, and others on insects. The wants of all can be easily ascertained. The trout of the Castalia spring, near Sandusky, mentioned in a former paper of mine, feed largely on a small crustacean, that abounds in the extensive banks of aquatic moss, found in that famous spring.

This moss also abounds in two species of the little fish, known as the stickleback. The trout feed largely on this fish, which is of the genus *Gasterostrus* (Linn.).

The brook trout of Lake Superior, in many places, feed largely on this fish. At one time I was fishing for trout at Partridge Island, near Marquette. I took a large trout with a fly; after landing it, she threw out of her stomach a live stickleback, which swam off lively enough. I have at this time over a half-dozen of the five-spined stickleback fishes in my aquarium, in my dining-room. They are a very interesting fish, and a favorite pet with me. They are a nest-building fish; the male builds the nests, and takes care of the eggs and the young. The nest is built among the aquatic plants, some distance above the ground, and is shaped precisely like a lady's muff, and the material is little bits of plants that he picks up, cemented together by mucus that he secretes. The male builds the nest in one night (or did with me, once upon a time).

I have never seen a stickleback over two and a half inches long; we have at least two species in Ohio; the three-spined, and the five-spined. While lying at anchor at Fort Mackinaw one day, I saw myriads of them near the surface of the water, and captured a lot and brought them to Cleveland, alive. I would say more about this interesting little fish, but I am too sick.

T. GARLICK.

BEDFORD, O., Jan. 19.

REPORT OF THE CONNECTICUT COMMISSION.

THE eighteenth report of the Fish Commissioners of this State opens with the question of the pollution of waters, and says that this is a matter which was not deemed worthy of an investigation by the last Legislature. After referring to a bill which was introduced in 1882, and which provided for a Commission to examine and report on this subject, they say that the question is a serious one, and one that will be sure to command attention again at no distant day.

There is no doubt that the pollution of rivers, streams and harbors by individuals and corporations in their greed of gain is a great and growing evil. Why the people of Connecticut, New York and other States have allowed their fisheries to be injured by manufacturers, whose only excuse for making sewers of our streams is that it would cost them more to dispose of it in any other manner, is beyond our knowledge. The report quotes from a Hartford paper concerning the growing scarcity of shad in the Connecticut River as follows: "The reason for the falling off is laid to the failure to pass stringent laws to prevent the taking of young shad, and the unwillingness of the fish to enter a stream so polluted by sewage and manufacturers' chemicals as the Connecticut is becoming."

A comparison of the fishing twenty years ago and now is thus made: "There are always people fishing off the docks at the river, but the catch is pitifully different from what it used to be, even twenty years ago, and the change is probably due more to the pollution of the water by manufactories on the main stream and its branches than to any other cause. At that time there were great numbers of perch, and in the course of a season a good many striped bass were caught, running usually from half a pound to five or six pounds. In the shad season, boys fishing for the perch with shad roe for bait used to get long strings, and, occasionally at such times, the water was fairly alive with small perch that could be caught litterally as fast as the line could be thrown in. All through the season there was a possibility of getting a reasonable quantity of good fish. Those who had occasion to drive across the river frequently will remember the bass fisherman who could usually be seen in a boat, anchored just above the bridge, and who kept at it day after day. Ten-pound bass were not so rare but that several were usually taken in a season. At present, very few of these fish are caught, and the idea of going out to fish all day for striped bass hardly occurs to any one. It is very probable that the putting in of black bass has done something to reduce the numbers of other fish, but those familiar with the river and with the ways of fish, attach more importance to the change in the water, and instance, among other things, the decrease in shad, which is sufficiently indicated by the fact that, with all the stocking of the stream from year to year, the supply does not reach the point that would be expected. Something is to be inferred also from the decrease in dace, a fish of no particular food value, but handsome, active fellows that thrive in clear water, and were large and abundant a few years ago, but are now much reduced in numbers, while comparatively few large ones seem to be left. The failure of the attempts to stock the river with salmon points in the same direction. Of all the young fry put in, very few reached maturity and returned; not nearly as many as might naturally be expected to escape the perils that attend small fish. The actual condition of the water may be seen by any who will examine it. In appearance, taste, and smell it is very different from what it was. The same process is going on that has been pretty well carried out in such streams as the Hockanum, where the mills have almost killed off all the fish that used to abound in the stream. One curious thing in both cases is, that though the fish are not nearly as plenty as before, there are still considerable numbers of young ones, apparently one year or sometimes two years old, while larger ones have disappeared. Allowing all that can be allowed for the use of fine meshed nets in the spring, it still seems as if the fish did not find food enough to thrive on in the contaminated water, or become diseased and died off. The fish that are now most abundant are the poorer sorts, that do as well in foul water as in clean. Artificial propagation partly meets the difficulty, as in the case of shad, but it cannot take the place of suitable natural conditions for the fish; and good judges maintain that the flavor of a Connecticut River shad is not what it used to be, even of those caught far up the stream so as to allow for the slight difference that used to exist, or was said to exist, between fish caught as they entered the river and those that had spent some days in fresh water. *As long as the river receives so much poison from factories, and so much sewage from cities, it is probable that the supply of fish will remain small in quantity and poor in quality.*"

The catch of shad in the Connecticut for the past three years was: In 1881, 351,678; in 1882, 272,903: in 1883, 177,308. In the Farmington river it was: In 1881, 11,505; in 1882, 3,800; in 1883, 1,155.

These facts are serious ones to reflect upon. Are the present modes of fishing so destructive to the shad as to lead to their extermination? The Commissioners have always believed this to be true, unless the natural increase be aided by artificial propagation. In fact they predicted exactly what has occurred. By referring to page 15 of the report of 1879, these words will be found: "For various reasons, but chiefly for want of a sufficient appropriation, the artificial hatching of shad at Holyoke has been discontinued for the last three years. A decrease in the catch of these fish may consequently be looked for during the next three, or perhaps four years." This prediction was based upon the fact that three or four years are required for a young shad to attain maturity. The above-mentioned figures show how just was the prediction. In 1881 artificial propagation was again commenced on the Farmington River, and each year since it has been continued as far as possible, though the location is far inferior to that in Massachusetts below the Holyoke Dam.

The report of the Superintendent, Mr. H. J. Fenton, gives a total of 3,215,550 shad fry planted. We will refer to the report again.

MARYLAND.—Elkton, Md.—*Editor Forest and Stream:* Col. Thomas Hughlett having been appointed clerk to the Court for Talbot county, has resigned the office of Fish Commissioner for the eastern shore of Maryland. During the time he held the office just vacated, he distributed twenty millions of fish to the waters of the eastern shore, against eighteen hundred thousand distributed by his predecessor. It is a matter of regret that the services of so efficient an officer should be lost to the lovers of fish and fishing. His successor has not yet been appointed.—T.

FIXTURES.

BENCH SHOWS.

March 4, 5, 6 and 7.—Cincinnati Bench Show, Melodian Hall. Entries close Feb. 25. Charles Lincoln, Superintendent, care of B. Kittredge & Co., Cincinnati, Ohio.

March 12, 13 and 14.—New Haven Kennel Club's First Annual Bench Show, Second Regiment Armory, Edward S. Porter, Secretary, Box 657 New Haven, Conn.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. C. Greville Harston, Secretary, Toronto, Canada.

April —, 1884.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **744.**

DOGS AND GAME IN TEXAS.

Editor Forest and Stream:

Texas sportsmen do not take as much interest in "feathered game" as the sportsmen of the more Eastern and Southern States, owing to the fact that we have always had an abundance of larger game, such as deer, antelope, bear, panther, cat, fox, etc., etc., and until quite recently plenty of buffalo inhabited the unsettled part of the frontier. Hence, we have but few good wing-shots as compared with the older settled States; and we are even further behind on dogs and dog-training than we are on good shooting. However, we have some fine shots and here and there a good dog. As a general rule, however, they are quite imperfectly trained, owing to the fact that each sportsman trains his own dog, professional trainers not being accessible. This has resulted in an entire absence of system throughout the State.

Dogs thus trained are entirely worthless except to the one who trains them, as they have by such a system only learned their master and not the science of hunting. For instance: I have a dog (a pointer) that I trained myself, or rather he and I have learned each other by constant association from his puppyhood, for I know nothing about training. To me he is a good dog, and with him I venture to say that I can bag as many birds in a day as Mr. Crawford with his matchless Gath, because he knows me even to a frown and I know him as well; but he cannot be handled by any one else at all. Neither can I handle him effectively in the field with other dogs without interfering with them. Nor can I instruct others how to handle him, because I have no system about it.

A good working dog is the very life of a hunt, and as one of your correspondents has remarked, "of infinitely greater satisfaction than a well-filled bag."

And here I would call the attention of Texas sportsmen to the importance of organizing a State kennel club, to the end that we may bring order out of the present chaotic state of affairs and drive the mongrel from the field. Besides, such an organization might materially aid in the preservation of game, which is now so abundant, but which under our present system is subject to devastation from every conceivable quarter.

Texas at present is indeed a fine field for the sportsman. Game of all kinds is abundant. Of the feathered class, we have the wild turkey, prairie chicken, geese, ducks innumerable, both as to quantity and kind, plover, various species of snipe, and two species of quail—the Bob White and blue quail, as he is called here. The Bob White is the most abundant and by far the best game bird, indeed, with me he is the ace of all birds. The blue quail is about one-third larger than the Bob White, bluish color, with speckled breast and crested head, presenting a handsome appearance. They are usually found in coveys ranging from 25 to 60; are fleet of foot, and will not

take to wing except when hard pressed. While the covey remains unbroken they will not lie from a dog or anything else. When broken and very much scattered, if they have good cover, will sometimes lie, though are quite unreliable. They are "no good" for the sportsman, but are the chief delight of the pot-hunters, who frequently kill as many as a dozen at a shot. As a table bird, they are about the same as the Bob White. They inhabit only the extreme western part of the State. Plenty of them in this immediate vicinity, and pot-hunters are now daily bringing in large quantities. M. M.

SAN ANGELA, Texas, January 1884.

A HOME FOR PET DOGS.

Editor Forest and Stream:

There are in the city of New York a very great many gentlemen who wish to keep a dog as a companion, but complain that they have no place to keep one. If they live at home there are many objections, and if they live at any of the hotels or boarding houses there are still more. To obviate all this I would suggest that a certain number of gentlemen get together and form a club, the object of which shall be to hire premises in a convenient neighborhood, say some stable where suitable kennels can be made, and rented by members by the year, and a good man and assistant be engaged who shall take charge and feed the dogs. The owners would then take an interest in the kennels, and it might then be further extended for the summer months by taking some place in the country, where the breeding and improvement of dogs could be thoroughly gone into. I think this idea would reach a class who are lovers of dogs, but perhaps have not the time or money to indulge in their hobby. We must commence in a small way. What we do afterward must be determined by the club or a committee appointed by the members. I shall be glad to receive any communications from your readers, and will say for myself, that finding the difficulty of keeping any of my dogs in city, I would like to meet with a few who are in the same fix, willing to rent a stable or some suitable place where we can have the pleasure of seeing our canine friends, and take them for a walk. I also think that if we get a sufficient number of members, we can institute a home for friendless dogs, and if we are sufficiently prosperous we can engage the best veterinary talent and institute a dog hospital; but this is all in the future, what I want to do now is to get enough men together who will share the expense of a kennel in New York for companionable dogs.

JOHN E. I. GRAINGER.

THE MASSACHUSETTS DOG LAWS.

THE present agitation of the question of the dog laws of our State, is due, so it is said, to the efforts of those acting in the interests of the sheep owners, with a view to encouraging the pastoral ambition of our people.

Let us look at the matter then from the sheep owner's standpoint. Let it be conceded that our legislators should look with a single eye to the development of the prosperity of such persons as desire to lead the guileless life of shepherds, and let it be conceded that other interests, even if they are those of a majority of our citizens, must be subservient to the small shepherd class. Then let us examine our statute books, and briefly, or fully, investigate the results of our present law, and it must be at once apparent that the gentle shepherds are amply provided for.

Chap. 102, of the Public Statutes of Massachusetts, Sec. 98, is to this effect: "Any one who suffers loss by the worrying, maiming, or killing of his sheep, lambs, fowls, or other domestic animals, may inform the chairman of the selectmen of the town, wherein the damage occurs, the chairman shall then decide whether the injury was caused by dogs, if so he shall appraise the amount thereof, provided he does not think it exceeds $20, if he thinks the amount of damages greater than that sum, he shall appoint two other appraisers to act with him; in either case a certificate of the appraised loss shall be made, which is to be allowed by the county commissioners, if no objection to the appraisal is proven before them; whereupon they shall issue an order for the amount of the certificate, which is paid from the dog taxes received and in the county treasury." This generous law does not compel the suffering farmer to prove his actual loss, nor to demonstrate that any particular dog, or, indeed, any dog did the mischief, the declaration of the omniscient selectman is sufficient, and upon it the dogs are convicted, his judgment is usually to the effect that the sheep or fowls came to their deaths by some means unknown, probably a dog.

Should the dog be decreed to be the criminal, the selectman then receives a fee of one dollar for making the appraisal of damages, but should he decide that any one of a thousand other possible causes led to this loss of the complainant, then such selectman receives only his mileage fee. Under such circumstances is it to be wondered at that only by a direct interposition of Providence are the dogs ever declared innocent, and is it not natural that the amounts disbursed from the county treasuries, on account of damages alleged to be caused by dogs, are so enormous? The decisions of the selectmen or the appraisers are, of course, chiefly based upon the ex parte statements of the complainant, and damages are assessed accordingly.

Here is a fact within my own knowledge to illustrate the working of the law:

In a certain town, which could be named, a certain farmer discovered one morning that several of his fowls had departed this life during the preceding night. Conscious that this apparent misfortune is in fact a real bonanza, he complains to the selectmen, and his loss is promptly assessed at about $40, to be paid from the dog taxes; after the certificate of damage had issued, a neighbor of this farmer confidentially informed the writer, that upon the night of the slaughter of the poultry he himself saw a fine fox emerging from the farmer's hen roost. "But," said he, "I shall say nothing of this, because there is no reason why my neighbor should not get his money."

But we have recited but one of the remedies allowed by our impartial law. When, as is rarely the case, a farmer has any legal proof that a dog did the mischief of which he complains, he may then recover from the owner of such dog, in an action of tort, double, or in certain cases triple, the amount of damages caused. This remedy is an alternative to the one first mentioned. Are these facts of a nature to bear out the assertion that sheep cannot be profitably bred in this State because our law does not afford the farmer adequate protection?

Having considered the case of the sheep owner, we may now fairly devote a few lines to the interest of the dog owner. He is taxed two dollars per year for every male dog over three months old, and five dollars for the same time for every female dog, and these taxes are further increased by municipal regulation, a perfectly enormous percentage when the average market value of dogs is estimated. These taxes are paid into the county treasuries to meet the drafts of the county commissioners under the provisions of law already cited. This charge is then, strictly speaking, rather of the nature of an indemnity fund, than a tax, and is deposited in order to rescue all possible losses attributed to the injuries caused by dogs. The ease with which this deposit may be drawn upon by claimants, and the want of any proper restrictions as to proof of claims, have been sufficiently illustrated. Yet in spite of the exorbitant drafts upon this fund, there is still a large surplus paid back to the towns every year for the purpose of maintaining schools or libraries. Why dog owners should be fixed upon as the victims to bear this burden, though it be to support excellent institutions, is certainly not clear. Nor is this all; any owner of a dog which has actually caused a loss for which damages have been paid from the county treasury as already mentioned, is still liable to the county for the damages so paid to be recovered in an action of tort.

Further than this, any person, be he of good or ill-repute, may, by simply making oath that he believes a certain dog to be dangerous, and giving notice of such oath to the owner, cause such dog, however innocent he may be, or however valuable to his owner, either to be killed or kept constantly confined; and any person may kill such dog if it be afterward found outside the inclosure, or away from the immediate care of its owner, however harmless the dog may be at the time.

Thus, under the sanction of the law, an evil-minded person may maliciously cause loss and suffering to an honest, peaceable citizen, either by compelling him to kill an unoffending animal, or at least to keep him perpetually imprisoned.

If an exhaustive investigation be made into the condition of things under the present law, there can but one result follow, the public will learn how, for the benefit of a few, the many labor under an unjust and overwhelming burden, and if any change in the dog laws be made, it should certainly be in the direction of relief to the dog owner.

It would seem to be wise then for the sheep owner and his friends to hold their peace, and be at least satisfied with the existing undue favor shown to them. Let them consider well the experience of the farmer in the fable, who in seeking too much, lost what he had, in killing his generous goose. LEX.

CINCINNATI DOG SHOW.

FOLLOWING is the premium list of the bench show to be held at Cincinnati, O., the first week in March: Mastiffs, St. Bernards, Newfoundlands, greyhounds, Scotch deerhounds, Irish water spaniels, field spaniels (over 28 pounds), cocker spaniels (under 28 pounds), foxhounds, beagles, dachshunde, bull-terriers, black and tan terriers (over 7 pounds), Bedlington terriers, Skye terriers, hard-haired Scotch terriers, Irish terriers, Yorkshire terriers, pugs, toy terriers, King Charles, Blenheim and Japanese spaniels, $10 for the best dog or bitch, and $5 for the second best; champion English setters, Irish setters and pointers, $20 for the best dog and $20 for the best bitch; champion Gordon setters, $20 for the best dog or bitch; champion fox-terriers, collies and pugs, $10 for the best dog or bitch. Open classes, English setters and Irish setters, $15 for the best dog, $5 for the second, bitches the same, puppies $7 and $3, dogs or bitches; black and tan or Gordon setters, $15 for the best dog or bitch, $5 for the second; puppies $7 and $3, dogs or bitches; pointers, dogs over 55 pounds, pointers, dogs under 55 pounds, bitches, any weight, $15 and $5; puppies $7 and $3, dogs or bitches; fox-terriers, collies, bulldogs, dogs, $10 and $5; bitches the same; fox-terrier puppies, $5 for the best dog or bitch; miscellaneous, three prizes of $5 each, making a total of $840 distributed among fifty-one classes.

DUKE.

DUKE—plain Duke without any extras. A common enough name, but no common dog, thank you! Of Irish extraction, which accounted for much of his wit and humor. Left an orpan at an early age, his youthful owner raised him on the bottle, sleeping on the sitting-room lounge that he might conveniently feed the puppy during the night. At two months of age Duke would retrieve nicely, and in due time became a reliable field companion. It is not of his field qualities that I am going to tell, but some of his pranks and misdoings. His original owner presented him to a brother-in-law, an official at Washington whose residence was in the country, fifteen miles from Washington and four miles from the railroad station. While his master had time to hunt, Duke was a model of perfection; but when business at the capital required the daily presence of his owner, Duke grew restless and cast his eye about for employment and recreation.

Duke wished to follow his master's carriage to the station each morning, but fearing to lose him, Mr. H. always fastened the dog in the house before starting. This grew monotonous to Duke, so he changed the programme by disappearing on the appearance of Mr. H. at the breakfast table. All search for him was fruitless, but at the sound of wheels going out the lane, Duke's head would appear around the corner of the barn, and setting off across the wood he would meet the carriage at a curve two miles from the house, and smile just as sweetly as if he was there by appointment, and there was no resisting that smile. Returning with the coachman, he would rest for a half hour and then start on the war path. After overturning the feed troughs of the chickens and turkeys, he would gnaw the halter of a favorite horse and race him down the lane. If the oxen were in the pasture, he would drive them into a corner and keep them there until some person called him away. He was contented if anybody would stay and play with him, but he must play, and if left alone would seek company among the stock, or amuse himself at the expense of somebody or something.

Phyllis, the cook, was invited to a wedding which would take place on Monday, and accordingly her best "fixings" had to be dusted, aired and trimmed up to the height of fashion. By Saturday noon all was ready and laid out on the bed of Phyllis's room in the "quarters."

"Golly! Dey's prone!" said Manuel, Phyllis's husband, as he watched her spread them out. "Guess dar won't be many 'coons dar dat 'ill take de shine offen dem fixins."

"Um, well I 'specs not. Jis' you go an' stir dat soup while I go fotch missus to look at my boardrobe," and the darkies left the room on their respective errands.

"Yessum, 'tis mighty putty, an' dem dar niggers 'ill be bilin' ober wid jellesum," said Phyllis, as she ushered in Mrs. H. to admire her outfit

"Very pretty, Phyllis!"

"Yessum, and dat dar—um, I 'specs—whar's dat—bonnit? Manuel! Manuel! What you do wid dat dar bonnit? I 'specs he's jis put dat bonnit on an' gone down stars to show off. Come back yer, Manuel!"

"Why, Phyllis, I haint got no bonnit. Fo' goodness sake, honey, what you tink I want wid yoo bonnit?" and Manuel rolled his eyes and gazed around the room, while Mrs. H. went to the window and looked out on the lawn.

Down stairs and out doors flew Phyllis. Duke was lying quietly on the grass, and raised his head and heaved a deep sigh as he looked sleepily at Phyllis. "Mighty funny—dat dog's bin asleep, else I'd b'leve he'd bin dar. Um, what's dat doin' dar," as she picked up a large red feather from a flower border. "You Juke, come yer!" but Duke stirred not. Her repeated calls only caused him to spread himself flatter and blink uneasily.

When Manuel appeared at the door Duke arose cautiously from a mass of tangled green silk, red ribbons and bonnet wire, which he had been lying on to hide, and bounded off to the woods. Mrs. H. made it all right with Phyllis by giving her another bonnet and a pair of earrings, and when Duke reappeared with his master's carriage no one would dream that he was anything but an orderly, rather sober dog.

M. VON CULIN.

THE BEAGLE CLUB.—We have received several ballots for officers of the new American-English Beagle Club. Blanks for voting will be furnished by Mr. W. H. Ashburner, No. 27 North Thirty-eighth street, Philadelphia, Pa. The nominations are: For President: W. H. Ashburner, General R. Rowett. For Secretary and Treasurer: A. C. Krueger, O. W. Rogers. For Executive Committee (three to be elected): J. M. Bergold, Dr. J. W. Downey, F. D. Hallett, General F. A. Bond, Dr. C. E. Nichols, A. Butler Duncan. A. D. Barber, Louis Sloan, T. T. Phleger, Jas. A. Stovell, J. N. Dodge. In compliance to the request of those who are interested we will receive and count the votes, which, the committee states, must be in hand by us not later than Feb. 5. We shall be very glad to see this club established, and we hope that all our readers who take an interest in the beagle will add strength to the club by enrolling themselves in its membership.

CURRENT DOG STORIES.

XXIV.

Madame Christine Nilsson's heroic rescue of a dog from the clutches of a parcel of boys caused a great deal of favorable comment among the members of the Society for the Prevention of Cruelty to Animals yesterday, and it was suggested by one of them that the society might present one of their new $1.50 silver medals to the songstress. The face of the medal bears the seal of the society. This represents a fencing match between Justice—with a sword—and a drayman—with a club—over the prostrate body of the latter's horse. The same member of the society who suggested the giving of the medal thought that Madame Nilsson—having probably a foreigner's contemptuous ideas of American art—might consider the scene portrayed on the face of the medal to be an attempt at a description of that enacted between herself and the boys. Neither Mr. Abbey nor Charles Mapleson had seen Madame Nilsson's new dog. Mr. Abbey had called, but the dog was "not at home." The occurrence has revived in theatrical circles many touching stories about actresses and dogs, most of which are comparatively new.

"Long before Mr. Abbey—I mean Madame Nilsson—rescued that dog," said John Stetson's representative at the Walnut Street Theater, "Miss Sara Jewett's dog fell out of the fourth story window of the Continental Hotel. This was last week, during the engagement of the Fifth Avenue Company here. Two legs and a rib were broken. Dr. Agnew was sent for and repaired the damages. Miss Jewett bore the shock with great fortitude. She took it as one of the trials of a star's life. When she was in a stock company her dogs never fell out of the window. Speaking of dogs, have you seen our pug?"

"Miss Jewett's dog is just a little too previous," said Manager Rice, at the Arch Street Opera House." Miss Marie Conron lost her dog, a beautiful Skye, when the Duff Company first came here. It was one of the first things that Mr. Duff did—I mean it was one of the first misfortunes that happened to the company."

"One of the saddest incidents that I ever beheld," said Mr. Gilmore, at the Grand Central Theater, "was when Miss Lyddy Denier's dog, a toy terrier, hardly larger than a mouse, leaped from its mistress's arms as she was leaving this theater, and was positively crushed to a jelly by a passing coupe. Miss Denier was the leading lady of the Buffalo Bill combination, which I need hardly say was here before the Duff Company. I hardly like to accuse Miss Conron's dog of plagiarism, but I think that Skye is a trifle left, so to speak."

"All these people forget," said Stage Director Frank H. Wade, at the Arch Street Theater, "that Miss Rose Eytinge's bulldog which appeared in 'Oliver Twist' leaped from the lightning express train, while on its way to this city from New York, at the very beginning of the season—way back in September—and has never been seen since. Kate Claxton lost her diamonds a little while before. The bulldog recognized the crisis and leaped."

Mr. Zimmerman met the *Times* reporter as he returned to the Chestnut Street Opera House after his round of the theaters. "The dog stories of this season are all very well," he said, coldly, after listening to them, "but the original canine calamity befel a member of Mr. Abbey's company nearly two years ago. I have just been given by M. Maurice Grau the real reason of Signor Campanini's absence from this country last year. Most people who witnessed his farewell performance at the New York Academy of Music nearly two years ago will remember that among the evidences of popular favor which followed his superb rendition of Manrico in 'Trovatore' was a small dog collar. The singer hid the breaking heart with which he accepted the gift under a smile. Its intended recipient was no more. On that very day the English pug in whose existence the first of living tenors was wrapped up had broken his neck in striving to touch the high C of the final 'Addio,' which his master reaches with such ease in the tower scene. Signor Campanini vowed never to revisit the scene of his anguish. Colonel Mapleson was unable to cause him to change his determination, but he yielded to Mr. Abbey's arguments. I think you might just as well suggest to those other gentlemen the propriety of calling in their dog stories."—*Philadelphia Times.*

BEASTLY BUSINESS.—Jefferson, O., Jan. 18.—*Editor Forest and Stream:* They had a "deer chase" at Newburg, near Cleveland, day before yesterday. I send you the following extracts from the *Leader*'s account of the indecent scrimmage. For their next hunt these gallant "sports" will probably employ a pet lamb. The account says: The excitement was heightened when there arrived from the city a heavy vehicle in which was a fine buck deer. The long wooden cage in which it was secured was lifted to the shoulders of four stalwart hunters and carried within the barn, where an opportunity was given to view the prisoner. He was a beautiful specimen of his much hunted race, but looked anything but savage or ferocious. His weight, as announced with something of a tinge of pride by his keeper, was 240 pounds. A reporter rode out to Newburg on an early train and started to walk to the scene of the great hunt about two miles distant. The event that was to take place could have been guessed if it had not been known. Great sleigh loads of men and boys, some of them carrying rifles or shotguns, dashed by. Sleek black and tans and speckled hounds were being led to the scene of conflict, and at their heels snapped and snarled a bevy of inferior curs. A more perfect day for the chase could not have been desired. The air was crisp and imparted a ruddy glow to the cheeks, but the cold was not severe enough to put a too heavy crust upon the snow. Scores of men had walked in from Bedford, Independence, Brooklyn and Newburg. They were gathered about in groups, and were discussing the merits of the various hounds. The hounds were corralled in the woodshed adjoining the hotel. They howled incessantly, and were apparently anxious for the chase. "We're ready for the chase now," shouted one of the hunters, whose dogs were yelling and howling inside. The management, however, didn't seem to be ready, and for about thirty minutes the prospects for a first-class row were quite flattering. The management wanted just $3 more, they said, to make up the cost of the deer. Ed. Lamb scratched around, and hustled together the cash. "Now for the hunt," he cried. "Not yet," yelled another member of the management, coming through the door. "You said you would go on when we raised $3 more," said Lamb. The management said they must have $5 more. Then the hunters kicked. They were not ferocious looking citizens, but they seemed to mean what they said when they told the management that either the deer would run or they would have their money back. Then the excitement became almost unbearable. The deer's cage was dragged out of the barn and the crowd jammed around it. A boy climbed upon the fence and lifted the door. The deer walked out and looked around him. A man jumped at him, but the animal didn't run. Then one of the hounds was led up close to him, but still the wild and untamed child of the forest didn't gallop away in that ferocious way that it is generally supposed anything but a pet deer moves. Finally the crowd yelled in unison and the deer started off through an orchard. That wasn't the way he had been expected to go, and the crowd chased him. A young fellow caught him and he was brought back and put in the cage. Then the deer, and cage, and boy on top were loaded into a wagon and driven off into a field. Again the door was lifted and again the crowd chased after the deer to make him run. A hound was finally let loose, but did not venture very close to the animal. A crowd of small boys then induced him to gallop slowly down the hill toward the river. A five-rail fence surrounded the lot and the savage animal couldn't get out. The crowd drove him around to a low place and the deer got into the road. He wanted to go back to the barn, but the

crowd blocked the roadway. A dozen little curs were set on his heels, and the deer started on a slow run down the road, four boys trotted along after him on horseback. The crowd came back to the hotel and the dogs were chained up to wait until the bloodthirsty animal had been gone an hour, when at the rate of speed he was under way when he disappeared he would have been about two miles away. The deer, however, is said to have exhibited considerable mettle after getting away from the crowd of men and the snarlings of the petty curs, and dashed away at a lively rate across the country. About forty minutes after his disappearance down the road the dogs were turned loose on the trail. Kuss, owned by H. Miller, of Bedford, took the lead early in the chase, and in about two hours overtook the deer in a field near Bedford. Hookaway's dog was close behind with one of Stanton's hounds a good third. Men in sleighs and on horseback had followed the general course pursued by the dogs, and were soon on the spot. The animal's throat was cut and he was loaded into a sleigh and taken to Gray's Hotel, Bedford, where one of the quarters was cut up into steaks, broiled and passed around among the hunters.

THE PHILADELPHIA KENNEL CLUB.—In the Kennel department of FOREST AND STREAM you stated, in reference to the non-holding of a bench show this year by the Philadelphia Kennel Club, that "if an exhibition was not to be given you could not imagine for what purpose the society was organized." I have been talking to several members of the club and feel that the executive committee was perfectly justifiable in reporting against the giving of a bench show this year and to wait until a better organization was effected. The present society is composed of the members of the old and parties, as it were, of another, and is, in a certain sense, the joining of two clubs. The great object in view in answer to your question is the holding of successful dog shows each year, which of course tends to improve and perfect the different breeds of sporting and non-sporting dogs. When the Philadelphia Kennel Club can secure the proper building and has thoroughly perfected its organization a show second to none will be held each year. The society has now sixty odd members and comfortable rooms for meeting and social intercourse, and those whose names are on the roll are practical sportsmen who, if the truth was known, would much rather discuss the merits of the setter and pointer in the field than on the bench. —HOMO.

THE GERMAN DOGGE.—Pittsburgh, Pa., Jan. 24.—*Editor Forest and Stream:* In last week's issue of FOREST AND STREAM a short piece headed "The German Dogge," claims that an article written by me some time since on the "Great Dane" has "many geographical as well as canine mistakes." Let us dissect his first charge. By running my eye over the article in question I see the sentence, "In Germany, at Aix, and in Prussia," this being the only geographical mention. I presume my accuser must refer to this when he says, "Aix la Chapelle belongs to Prussia," and then says, "Prussia is in the great German Empire," two important truths which I do not, nor never have denied nor affirmed. So much for the "geographical mistakes." As regards the remainder, Mr. Solms, of the Austrian Consulate, translated the words "Deutsche Dogge" as "German dog," and I respectfully refer the gentleman to him for further argument.—E. P. HODGES.

SALE OF RECTOR.—Mr. J. K. Emmet, the well-known actor, has purchased the rough-coated St. Bernard dog Rector, recently imported by Mr. E. R. Hearn, of Passaic, N. J. Rector is the largest known dog in the world, measuring close to thirty-five inches, standard, at the shoulders, and when sold weighed 195 pounds. During the past year he was very successful at the English shows, in the hands of Mr. S. W. Smith, and he certainly is a most commanding dog. His defective point is his head, which tapers so much as to quite deprive him of the dignity so much desired in a St. Bernard. In all other respects he is a splendid specimen, and is worthy of the encomiums bestowed on him by Col. Stuart Taylor, in his letters to FOREST AND STREAM. The price paid was $4,000.

EASTERN FIELD TRIAL CLUB.—At the annual meeting of the Eastern Field Trial Club held on Jan. 22, it was voted to close the entries for the Derby of 1884, on the 1st of May. The report of the treasurer shows that the club is in a very prosperous condition. Following is a list of the officers for the ensuing year: President, Elliot Smith; Vice-Presidents, Henry F. Aten, M.D., J. Otto Donner; Treasurer and Secretary, Washington A. Coster; Board of Governors, S. Fleet Speir, M.D., Chas. H. Raymond, A. E. Godeffroy, H. E Hamilton, R. C. Cornell, George DeF. Grant, George T. Leach, Jno. Heckscher, Jno. E. I. Gringer, J. W. Orth, D. S. Gregory, Jr., Alexander Taylor, Jr.

THE PHILADELPHIA KENNEL CLUB.—*Editor Forest and Stream:* The Philadelphia Kennel Club have secured pleasant and roomy quarters at 138 Market street for their own use and are now in a flourishing condition. The club now has seventy members on the roll and have an active executive committee. It has been decided best not to hold a bench show the coming spring, but hope to in the future, when it will become a fixture here. The rooms of the club are made attractive and all the leading papers are subscribed to and are on file. Besides the regular meeting nights, one evening a week is spent by the members in social enjoyment.—W. H. ASHBURNER, Corresponding Secretary.

THE GILROY FIELD TRIALS.—San Francisco, Cal.—*Editor Forest and Stream:* I note in your report of the Gilroy trials that it has been edited so carefully as to make it inaccurate in several little points. At page 460 of FOREST AND STREAM, where the report of the running of the second brace in the Puppy Stake is given, my recollection is that Paine's Belle was described as a smooth collie. That is what she is, and I was anxious to have her appear as such, because her owner manufactured a pedigree for her, and may think now that your reporter could not tell a collie from a Gordon. —FRANCISCO.

NEW HAVEN DOG SHOW.—The bench show to be held in New Haven next March, under the auspices of the New Haven Kennel Club, will undoubtedly bring out a large number of dogs. The classification, with one or two minor exceptions, is similar to that of the last show of the Westminster Kennel Club. The prizes will be silver medals, suitably engraved, for the champion and first, and bronze medals for second prizes. Mr. James Watson will judge the setters, pointers, spaniels and hounds, and Mr. James Mortimer the remaining classes.

THE DOGS MUST GO if they are advertised for sale in the FOREST AND STREAM. See what Mr. Elmore says (in Kennel Notes), and here is a line from Mr. George Laick, who recently advertised two dogs: "Please say to many inquirers that I have sold both my dogs, one twenty-four hours after the advertisement came out and both inside of ten days after. I have had a great many letters from all parts of the country from my advertisement in FOREST AND STREAM.—GEORGE LAICK (North Tarrytown, N. Y.).

STOLEN.—On the night of Dec. 16, some one stole from the Rory O'More Kennel, Albany, N. Y., the red Irish setter bitch Lady. She has a small white spot on breast, and is heavy in whelp. Mr. Callender offers $500 reward for information that will lead to the conviction of the thief and the recovery of the bitch.

THE LARGE POINTER CHALLENGE.—Luzerne, Pa., Jan. 27. *Editor Forest and Stream:* I have just learned of the acceptance of my challenge by Mr. C. H. Mason with his dog Beaufort. Owing to some mistake or delay our newsdealer failed to receive the issue of FOREST AND STREAM which contained Mr. Mason's reply, so I know nothing of its character. It gives me great pleasure to think that I shall have an opportunity to show my dog against Beaufort. It is my honest belief that in a fair and impartial trial I can beat him. If I am beaten I will accept the defeat like a man. All I ask is, no matter where the competition takes place, that I get fair play.—GEO. W. FISHER.

PITTSBURGH, Pa.—The Western Pennsylvania Poultry Society have elected the following officers: President, Edward Gregg, of Allegheny; Vice-President, B. F. Wilson, of East End; Treasurer, C. A. Stephen, of Allegheny; Secretary, C. B. Elben, of Pittsburgh; Directors—T. Booth, of Allegheny; Wm. Myer, of Sharpsburg; J. P. O'Neill, of Sewickley; Wm. Wade, of Pittsburgh, and Howard Hartley of Pittsburgh. This election retains the president, who has held the position for fourteen years.

INFORMATION WANTED.—*Editor Forest and Stream:* Can you or any of your readers give me the name, or any information regarding a bitch imported about twelve years ago in whelp by Bang Bang or Bonny Bang, owned by James Shaw of England. She had her pups in Syracuse or Auburn, N. Y., and one of the pups, Ponto, took the cup at the Montreal bench show, which was presented by the champion pigeon and rifle shot of Canada.—POINTER.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Whisper. By Mr. C. K. Drane, Burnside, Ky., for black and white English setter dog, whelped June 20, 1883 (champion Gath—Lit).

Lufra. By Mr. H. W. Smith, Worcester, Mass., for fawn greyhound bitch, 5 years old (Ferret—Little Bess).

Ringweld and Chimer. By Mr. S. C. Graff, Pittsburgh, Pa., for black, white and tan beagles, dog and bitch, whelped Aug. 31, 1883, by Mark Antony (Major—Diana) out of Wicklow (Dyke—Ringlet).

Diamond Vic. By Mr. S. C. Graff, Pittsburgh, Pa., for white, black and tan fox-terrier bitch, whelped Feb. 6, 1883, by Curate (Rector—Vic) out of Gipsey (Viper—Vernon).

Gibbie, Luath, Coilus, Dugald and Ronald. By the Kilmarnock Collie Kennel, Boston, Mass., for sable and white collie dogs, whelped Dec. 4, 1883, by champion Robin Adair out of imported Isle.

Monica, Elsie and Nannie. By the Kilmarnock Collie Kennel, Boston, Mass., for two sable and white and one black, tan and white collie bitches, whelped Dec. 4, 1883, by champion Robin Adair out of imported Isle.

KILMARNOCK COLLIE KENNEL.

Mr. T. C. Faxon, Boston, Mass., claims the name of Kilmarnock Collie Kennel for his kennel of rough-coated Scotch collies.

BRED.

☞ *See instructions at head of this column.*

Smut II.—Lava Rock. The Locust Grove Kennel's (Manton, R. I.) English setter bitch Smut II. (Pratt's Trim—Earle's Smut) to their Lava Rock.

Lucid—Emperor Fred. Mr. E. A. Herzberg's (Brooklyn, N.Y.) English setter bitch Lucid (A.K.R. 176) to his Emperor Fred (A.K.R. 33), Jan. 28

Queen Bess—Friday Night. Major Lovejoy's (Bethel, Me.) greyhound bitch Queen Bess (Leo—Juno) to Mr. H. W. Smith's champion Friday Night, Jan. 25.

Belle—Beaufort. Mr. D. S. Gregory, Jr., 2d's, pointer bitch Belle (Sensation—White's Grace) to Mr. C. H. Mason's Beaufort (A.K.R. 691), Jan. 23.

Josephine—Tippoo. Mr. John E. Thayer's (Boston, Mass.) bull bitch Josephine (A.K.R. 388) to his Tippoo (A.K.R. 390), Dec. 9, 1883.

Judy—Romulus. Mr. John E. Thayer's (Boston, Mass.) bull bitch Judy (A.K.R. 322) to his Romulus (A.K.R. 389), Dec. 23, 1883.

Floss—Rex. Mr. Jason Houghton's (Milton, Mass.) collie bitch Floss (A.K.R. 675) to Mr. J. Lindsay's Rex (A.K.R. 149), Dec. 14, 1883.

Princess Eugenie—Buckellew. Mr. Sheriden's English setter bitch Princess Eugenie to Mr. W. A. Coster's Buckellew (A.K.R. 30), Dec. 15, 1883.

Ace of Spades—Obo II. Mr. G. H. Gilbert's black spaniel bitch Ace of Spades to Mr. J. P. Willey's Obo II. (A.K.R. 432), Nov. 30, 1883.

Lofty—Obo II. Mr. J. P. Willey's (Salmon Falls, N. H.) spaniel bitch Lofty (A.K.R. 430) to his Obo II. (A.K.R. 432), Dec. 15, 1883.

Ruby—Fennel. Messrs. Morris & Baldwin's (Deer Park, Ont.) fox-terrier bitch Ruby (A.K.R. 741) to Mr. R. Gibson's Fennel (Spice—Bloom), Dec. 7, 1883.

Vision—Bang Bang. Mr. F. R. Hitchcock's (New York) pointer bitch Vision (Croxteth—Vinnie) to the Westminster Kennel Club's Bang Bang (A.K.R. 394), Jan. 26.

WHELPS.

☞ *See instructions at head of this column.*

Madge. The Ashmont Kennel's (Dorchester, Mass.) mastiff bitch Madge (A.K.R. 548), Jan. 26, ten (six dogs), by their Diavolo (A.K.R. 543).

Pearl. The Rory O'More Kennel's (Albany, N. Y.) red Irish setter bitch Pearl (Dash—Kate), Dec. 6, 1883, eleven (six dogs), by their Pat O'More (Rory O'More—Norah O'More).

Sylvia. The Rory O'More Kennel's (Albany, N. Y.) red Irish setter bitch Sylvia (Rory O'More—Sampson's Nora), Dec. 20, 1883, nine (six dogs), by their Rexford (Berkley—Sampson's Nora).

Sybil. The Rory O'More Kennel's (Albany, N. Y.) red Irish setter bitch Sybil (Larry—Anne Boleyn), Jan. 1, ten (six dogs) by their champion Rory O'More.

Rose. Mr. Gardner G. Hammond's (New London, Ct.) Chesapeake Bay bitch Rose (A.K.R. 142), Dec. 19, 1883, seven (two dogs), by Mr. J. A. Loring's Sport. All since dead.

Rusk. Mr. Gardner G. Hammond's (New London, Ct.) Chesapeake Bay bitch Rusk (A.K.R. 144), Dec. 9, 1883, eleven (five dogs), by Mr. J. A. Loring's Sport. Three bitches living.

Lorna II. Mr. John E. Thayer's (Boston, Mass.) deerhound bitch Lorna II. (A.K.R. 330), Dec. 27, 1883, eight (five dogs), by his Lance (Brau—Maida II.).

Daisy. Mr. John E. Thayer's (Boston, Mass.) pointer bitch Daisy (A.K.R. 395), Dec. 27, 1883, two dogs, by his Bramble (A.K.R. 265).

Brenner. The Chequasset Kennel's smooth-coated St. Bernard bitch Brenner (A.K.R. 706), Nov. 2, 1883, six (five dogs), by Alp II. (A.K.R. 705).

Rube. Dr. S. H. Green's (Newmarket, N. H.) spaniel bitch Rube (A.K.R. 734), Dec. 18, 1883, ten (six dogs), by Obo II. (A.K.R. 432).

SALES.

☞ *See instructions at head of this column.*

Fentch, Southington, Ct.

Flute—Victress whelp. White, black and tan bitch, whelped Sept. 10, 1883, by Flute out of Victress (Victor—Lucy), to Mr. Enos A. Messenger, Hartland, Ct.

DEATHS.

☞ *See instructions at head of this column.*

Tom. Lemon and white pointer dog (A.K.R. 405), owned by Mr. James P. Swain, Jr., Bronxville, N. Y., Nov. 16, 1883, from distemper.

Kate. Lemon and white pointer bitch (A.K.R. 460), owned by Mr. James P. Swain, Jr., Bronxville, N. Y., Nov. 20, 1883.

Grace. Lemon and white pointer bitch (A.K.R. 352), owned by Mr. James P. Swain, Jr., Bronxville, N. Y., Dec. 18, from pneumonia.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

R. R. W., Albion, N. Y.—Clip the hair evenly. It will soon grow again.

F. E. L., New Market, Md.—The pedigree is in such shape that we can make nothing of it. Write to Mr. Pollock.

POINTER, Thomaston, Ct.—Your dog has probably caught a severe cold, and with careful nursing will be all right in a few days.

H. M., Princeton, N. J.—Give the puppy an occasional small dose of epsom salts, and wash the sores with a weak solution of sulphurous acid.

G. B. F., Dover, Me.—1. We are not aware that there is any agent in this country; write to the *Field*, 346 Strand, London, Eng. 2. We could not prescribe for your dog without a more definite description of the symptoms. Write again, giving full particulars of any cause that may have induced the trouble.

THE SOLACE OF RHEUMATIC OLD AGE.—A correspondent writes: "Although so large a number of sportsmen have contributed to the FOREST AND STREAM, there are many others—from whom we seldom or never hear—who are abundantly able to interest and instruct. I confess to a large degree of selfishness in this, for I have arrived at that point when I must get the most of sporting pleasure from the experience of others. So 'keep up the motion!'"

Rifle and Trap Shooting.

RANGE AND GALLERY.

THE NEWARK TOURNAMENT.

THE third match in the tournament series has just ended at the Celluloid Range. The clubs have greatly improved in shooting since last match, which will be seen in the scores. There are six matches to complete the tournament, three having been shot. The Essex Rifle Club have held the lead for the past three years by two or three points over all others. The Frelinghuysens, who have held a good second, are now coming to the front, having succeeded in winning two out of the three matches, and above all making the handsome score of 471 out of a possible 500 in the last match, placing them ahead of the Essex one point so far. The Domestic Club, numbering 120 men, are striving for third position, they being only 32 points behind, and three matches to shoot. The last match is given below. We now have in our association about 500 members; of these 100 are excellent shots; the remainder shoot on an average.

The fourth match of the Newark Rifle Association will be held on the Domestic Range, Market street.

BOSTON, Jan. 26.—The fine, bright weather of to-day served to attract a large number to the comfortable and commodious shooting house of the Massachusetts Rifle Association at Walnut Hill, but on arriving there it was found that the bright promises of the morning were not to be fulfilled. The wind did not appear to be very strong, but it proved to be a difficult one. The light was good, and had the wind been a little less tickle it would have been plums for the shooters, but they would have lost much valuable experience. Next Wednesday the glass-ball and clay-pigeon shooters will contest. The following are the best scores of yesterday:

Creedmoor Practice Match.

J B Fellows	5554444555—46	P J Forest (mil)	5344444344—39
C B Edwards	4445455554—45	W Kirkwood	4454444441—39

Combination Match.

W Gardner	7	7	8	8	10	8	7	9	8	7—79
A C Adams	9	10	7	7	9	6	8	7	7	6—76
W J Look	8	6	10	7	6	7	8	8	10	5—75

Novelty Match.

W Gardner	8	8	7	4	4	9	5	5	8	8—66
C B Edwards	1	6	9	10	7	3	7	9	6	4—62

GARDNER, Mass., Jan. 24.—The last regular meet of the Gardner Rifle Club was omitted. Yesterday the club went out to Hackmatack range for practice. They used the American decimal target. The shooting was off-hand, distance 200yds. Out of a possible 100 the following scores were made:

Chester Hinds	9	10	9	9	8	8	8	9	9	10—89
H Cheney	8	5	9	10	10	8	10	10	10	9—89
G F Ellsworth	9	6	9	9	9	9	9	9	9	9—87
G Fordyce	9	6	9	8	8	9	10	9	9	8—85
A Mathews	10	9	7	10	9	4	7	10	8	9—83
M Atherton	9	7	6	10	6	9	7	8	9	9—80
W C Loveland	9	7	10	6	9	8	8	10	8	5—80
L Warren	5	8	9	9	7	9	9	7	9	7—79
I Newman	9	8	7	6	10	10	4	9	5	10—78

The club are soon to shoot a match with the Brattleborough (Vermont) Club, they having received a challenge. The shooting is to be on the grounds of each club, the score to be exchanged by telegraph.

BOSTON SCHUETZEN CORPS.—The East Boston Schuetzen Corps held its weekly shoot on Friday at the range at Oak Island. The day was anything but favorable, but some good shooting was done. The newly-elected captain of the club had the van, closely followed by his predecessors. The following are the scores:

Captain Garney	5445545455—46	F Kline	4544545453—43
C M Gueth	5145445455—45	E Bennett	4544434455—42
O Crist	4454445545—44	M Sharp	4545355344—42
C Mirth	4445555444—44	E L Gibbs	5354234445—39
F Orth	4444445545—43	W Saunders	3433054544—35

LUTZOW vs. ESSEX.—New York, Jan. 23.—Match at Zettler's Gallery between the Lutzow team, of New York, and the Essex second team, of Newark; 12-ring target; 10 shots per man; possible 120:

Lutzow Team.		Essex Team.	
A Lober	114	C Rittmeyer	107
M Dorler	118	J Hiegel	100
B Zetzler	114	W Dutcher	90
G Bernius	106	F Helmes	101
A Ringler	105	G Vanburgh	98

G Mehrbach	112		

H. LOBER, Secretary.

GALLERY SHOOTING.—Some very good shooting has been done during the past week by amateurs at the Mammoth gallery, Boston, and many who do not care to face the cold winds, resort there to keep up their practice at 50yds. range. The following are the best scores made during the week, off hand:

J Larkin	4444455555—45	R McRobbie	4454455444—43
P D Parker	4444445555—44	R E Bellows	3314455555—43
I Higgins	5544544445—44	I Ennen	4444444145—41
J E Leonard	5525444444—44	M A King	5444444444—41

A SOLDIER'S INVENTION.—An invention of great utility to the militia, and also of value to hunters, has lately been patented by a soldier of the U. S. Infantry. It is a device for the extraction of headless shells, in regard to which great difficulty has heretofore been experienced. The chief trouble has been to remove the impediment without injuring the grooves of the rifle. The present invention, which is a product of the brain of Mr. William Pratt, of the Seventh Infantry, stationed at Fort Laramie, seems to accomplish this, and so successfully that it has been recommended by General O. O. Howard and other officers of the Army of high rank who have tested it.

DEATH OF CAPT. BROCKHOFF.—Capt. William H. Brockhoff, a famous rifle shot, formerly a resident of this city, died recently on his ranch in Sonoma county from a fracture of the skull, caused by the runaway of a team which he was driving. The deceased was excellently well known here as the captain of a German militia company and abroad as the National Guardsman who made the highest individual score at the Creedmoor Centennial trials.—*San Francisco Chronicle, Jan. 6.*

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

RHODE ISLAND NOTES.

Editor Forest and Stream:

The game season now being over, the "boys" are beginning to take more interest in trap-shooting, and every Thursday, stormy or pleasant, finds a goodly company at the club grounds on Broad street.

How differently we are situated now with our comfortable warm club house, with a red hot stove diffusing its grateful heat, the "boys" drawn up in a circle around it, spinning yarns about the past hunting season, how old Trim stood that cock partridge on the edge of the "Great Swamp" and how Sancho roaded the big bevy of quails the whole length of "Long Meadow" and finally "nailed" them in the old cranberry bog; and as we glance upward and view the elegant specimens of the taxidermist's art that adorn our walls, not to speak of the tasteful oil paintings, etc., we can but think of the contrast of the old shed of but two short years ago, when a few of the "boldest spirits" among us used to gather on this same spot and "peg away" at glass balls. We had no fire then and the only way to warm our fingers was to shoot fast enough to heat our gun barrels. Speaking of glass balls, they are with us almost a thing of the past, we are now shooting clay-pigeons almost exclusively, and those from five traps; the object being to put ourselves in "trim" for the great event at Chicago in May next, where we expect to send a team providing our scores in practice seem to warrant us a fair show of success. The spring, however, is our season *par excellence* for trap-shooting, as after the long winter the boys creep out, like woodchucks from their holes, and make it decidedly warm for the clay-pigeons, glass balls, etc., although with our now comfortable quarters, we have more winter shooting than we formerly did.

The game season has been a remarkably good one with us during the past fall, though doubtless those sportsmen living in more favored sections would laugh "long and loud" at the idea of a half dozen partridges (ruffed grouse) or a dozen quails being considered a good day's work; but so it is here, and we have to make the best of it. Quail seemed to breed well here last season, and if we have the remainder of the winter favorable for them we shall probably have fair shooting again next fall, as there are a good many left over. Not so, however, with the partridges, as they have been snared terribly in most sections of the State. I was credibly informed that in one county alone 5,000 birds were snared and shipped to market, and on ground where, in September, another gentleman and myself killed thirty-five birds in two days in November; with three good dogs in two days' hard hunting we failed to start half that number on the same ground, although we left plenty of birds on the first occasion, the cover being very thick at that time; the woods were full of hedges, and that told the story. I think I heard some one ask why don't you stop it? Well, that is easier said than done. Most of the trapping is done by farmers' boys, and there is a clause in the game laws which allows one to trap on his own land; besides we do not wish to incur the everlasting hatred of the tillers of the soil, as by so doing we should "kill the goose, etc.," for we should be unceremoniously told to "git" every time we ventured on their lands, so there you have it, and we have to be thankful for the few birds we do get.

W. H. SHELDON.

PROVIDENCE, Jan. 20.

MASSACHUSETTS CLUBS.

THE Boston Gun Club held a tournament at Wellington Jan. 23, the same being the initial meet of a series of alternate Wednesday shoots. The attendance was over 60, including representatives from the various gun clubs of the State. The sweeps of the day are subjoined:

First event (7 birds, 18yds. rise, miss and out, 25 entries)—Wilbur and Williams first, Jenkins, Kirkwood and Johnson second, Sawyer and Sampson third, De Rochmont fourth.

Second event (7 birds, 18yds., 25 entries)—Jenkins and Wilbur first, Houghton and Kirkwood second, Clark, Williams, Allen and Webber third, Gerrish and De Rochmont fourth.

Third event (7 birds, 28 entries)—Perry and Clark first, Smith, Sampson and Davis second, Johnson, Gilman and Harrison third, Jenkins fourth.

Fourth event (5 pair doubles, 28 entries)—Gilman and Curtis first, Emerson second, Cooper, Tinker and Wilbur third, Smith fourth.

Fifth event (7 birds, 5 traps, 34 entries)—Cutting and Clark first, Tinker and Davis second, Schaefer and Wilbur third, Mann and Eager fourth.

Sixth event (3 pair doubles, 5 singles, 28 entries)—Williams, Harrison and Jenkins first, Perry and Stanton second, Davis, Clark and Schaefer third, Gilman fourth.

Seventh event (7 single birds, 37 entries)—Kirkwood, De Rochmont, Smith and Gilman first, Evans and Wilbur second, Davis and Emerson third, Schaefer and Paine fourth.

Eighth event (7 singles)—Emerson first, Evans and Kirkwood second, De Rochmont and Jenkins third.

Ninth event (3 pairs, Chicago rules governing)—Perry, Curtis and Nichols first, Jenkins and Wellman second, Smith third, Sawyer fourth. Much interest centered in the ninth match, the rules being similar to those which will be adopted in Ligowsky sweepstake at the Chicago meet. Altogether the shoot was of a most enjoyable kind. Over 3,000 birds were trapped, and the hum of the seven traps betokened the liveliness of the shoot. The next meet, on Feb. 6, will also be represented by the noted shots throughout the New England States, and of which you will receive report of same. Upon inquiry among our members, seven-trap shot is most used upon clay-pigeons.

D. K.

The Lynn Central Club held its ninth shoot for the silver cups Friday, Jan. 25. There was a good party present to contend for them. E. L. Beale of Newburyport, took the cup for clay-pigeons on a score of 17. J. P. Randall took the glass-ball cup on a score of 18 out of 20. There are three who have one chance each in the clay-pigeon cup, and four with one chance each in the glass-ball cup. There were twelve sweeps at clay-pigeons and six at glass balls. The next shoot will be held Feb. 1.

Quite a number of sportsmen were present at the range of the Malden Gun Club this afternoon to participate in the competition match for the gold badges. The conditions were unfavorable for good scores. Following are the winners of the medals: J. Buffum took first with 15, A. F. Adams second with 11, and F. J. Scott third with 9 out of a possible 20. W. H. Trebor was first in the match for a keg of powder, the conditions being 21yds. rise, both barrels, at 5 birds. In the match for a bag of shot, Fielding, Adams, Law and Hopkins tied, and in the shoot-off Hopkins won. This match was quite interesting, and was shot under the rules adopted for the coming Chicago tournament, the shooters standing back some thirty yards and then given from one to ten yards, the distance unknown to the shooters before the trap is sprung.

There was not a large attendance at the grounds of the Boston Gun Club, Jan. 26, and the weather conditions were unfavorable for good scores. Following are the winners in the sweepstake matches:

First event, seven birds—Law, first; Sawyer and Kirkwood, second.
Second event—Kirkwood, first; Sawyer, second.
Third event—Emerson, first; Chambers, second.
Fourth event—Emerson, first; Snow, second.
Fifth event, three pairs of double birds—Emerson, first; Chambers, second.
Sixth event—Sawyer and Emerson, first; Chambers, second.

ONTARIO MATCHES.—Several shooting matches came off at St. George on the 21st, opening with a match between Wayper, of Guelph, and Stroud, of Hamilton, for $25 a side, at twenty-five birds each.

Wayper.....1110101111111111111110111—22
Stroud.....0110000111011111110001111—16

The second shot was Woodstock v. Branford, in which Woodstock had the best of it; ten birds each.

Woodstock.		Brantford.	
J Forbes	7	T Westbrook	8
G Grant	8	F Westbrook	9
— Walker	7	W Baxter	2

A sweepstakes followed, at five birds each.

Forbes	1 1 1 0 1—4	T Westbrook	1 0 0 1 1—3
Turnbull	1 1 0 1 1—4	Mackenzie	1 1 1 0 0—3
Baxter	1 1 1 0 1—4	Passco	0 1 1 0 1—3
Wayper	1 1 1 1 0—4	Stroud	1 0 1 0 0—2
Grant	1 1 1 0 1—4	Miller	1 0 0 1 0—2
Walker	1 0 1 1 1—4		

In shooting off ties, Forbes won.

The meeting wound up with a match between F. Westbrook and Walker, five birds each. Each killed three in the match. Westbrook winning on second tie.

NEWTON CENTRE GUN CLUB.—Boston, Jan. 27.—The Newton Centre Gun Club was formed the past summer. Starting with ten members, it now numbers twenty-eight, and is a wide-awake organization. It has secured a club room, and during the winter has the use of a bowling alley, and meets occasionally on its shooting ground for glass ball and pigeon shoots. Next week, by invitation of one of its members, the club goes on a sleighride, and lots of fun is sure to come. We number a few crack shots, and have accepted an invitation from a neighboring club for a team shoot, which will come off within ten days.—H. H. R.

SIZE OF SHOT FOR CLAYS.—In last issue I notice a request from a correspondent for opinions as to proper size of shot to use in shooting clay pigeons. I have had some experience with this festive bird and I find from repeated trials that No. 7 chilled gives the most satisfaction.—OCTO.

RIDGEWOOD, N. J., Jan. 21.—Match at twenty-one birds each; 21yds. rise, trap and handle; R. Busterd, 101111000100001001—8; D. Hopper, 111110011110111011—13.

Canoeing.

FIXTURES.

Winter Camp-fire.—Tuesday, Feb. 19, 8 P. M., No. 23 East Fourteenth street, Room 16.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

AMATEUR CANOE BUILDING.

Fifth Paper.

THE lines of the drawing now show the outside surface of the plank, but the moulds over which the boat is built must, of course, correspond with the inner surface of planking. In large work the model is often made to the outside of the frames only, then the breadths when taken off show the actual size of the frame. If the working drawings are made to include the plank, the thickness of the latter is deducted at some stage of the drafting prior to laying down. In our canoe, for convenience, the drawings will all include the plank, so in making the moulds its thickness, ¼in., must be deducted.

To copy the frame lines, a piece of thin board or cardboard, A B C D, Fig. 3, is slipped under the paper of the large drawing, adjusted under the line to be copied, and held in place by a couple of tacks. Setting the points of the compasses ¼in. apart, a row of spots is pricked through the paper into the board, ¼in. inside the frame line, shown by the small circles in Fig. 3. At the same time points on the center line, E F, load water line and the diagonals D1 and D2 are also marked. The board is then removed, a batten run through the spots, and the wood trimmed away to the line. If the drawing is made on a board or floor the lines may be taken off, as in Fig. 4.

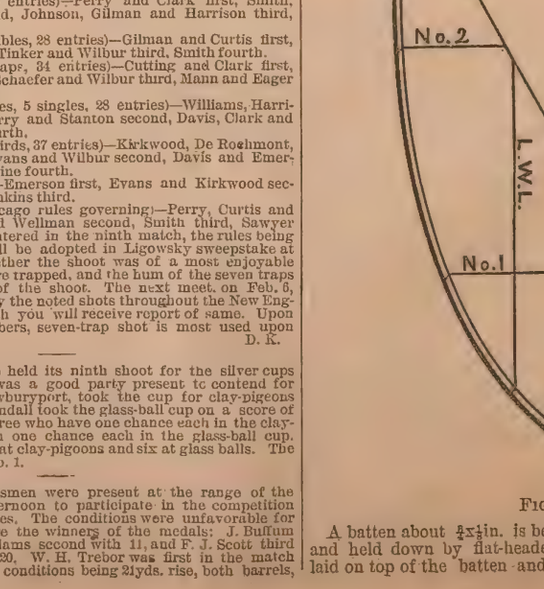

FIG. 6.

A batten about ¾x¼in. is bent along the line on the floor, and held down by flat-headed nails. A piece of board is laid on top of the batten and a mark scratched on its under

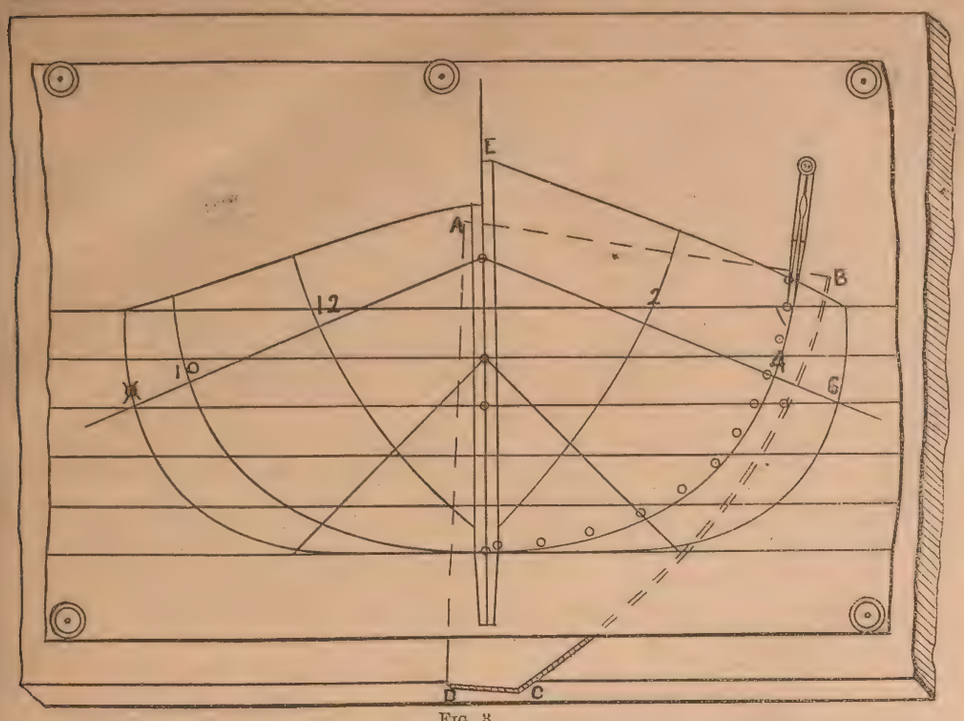

FIG. 3.

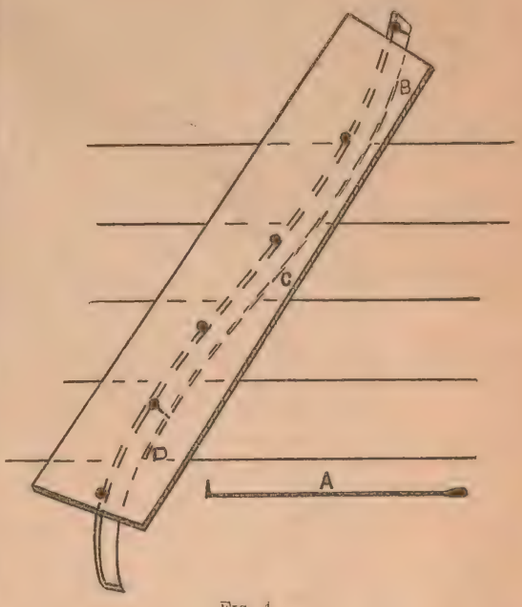

FIG. 4.

side with the piece of bent wire shown at A. In this case, after cutting to the mark another line must be gauged ¼in. inside the edge, and a second cut made to it, after which it is laid on the drawing and the center line, water line and diagonals laid off on it.

To make the complete mould, a piece of 1in. pine is planed up on one edge, H I, Fig. 5, a center line E F, is drawn at right angles to it, and also the load water line, then the pattern is laid on this board, adjusted to the center and water lines, and one-half marked off; then the pattern is turned over, adjusted on the other side of E F, and that side also marked off, the diagonals being marked at the same time.

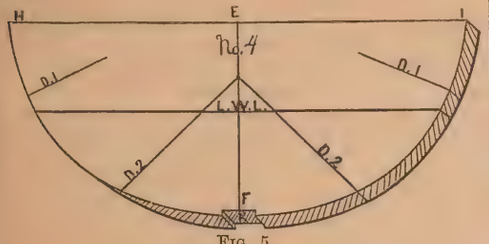

FIG. 5.

As the boat tapers from midships to the ends, it will be evident that the after side of the forward moulds will be slightly larger than the fore sides, and the reverse will be the case with the after moulds, No. X having both sides the same in most canoes. To allow for this bevel, moulds 2, 4, and perhaps 6 must be sawed out ¼in. larger than the marks show. The bevels at the deck height and on each diagonal are now taken from the drawing with a common carpenter's bevel, applied in turn to each of the above points, and the edges of the mould are trimmed accordingly.

To complete the mould, a notch K must be cut at the bottom to admit that portion of the keel or keelson inside of the rabbet, as will be explained later.

Besides the moulds described there will be required a stem mould (Fig. 6) giving the outline of the stem, a rabbet mould made to the rabbet line (if the stern is curved similar moulds will be required for it) and a beam mould, showing the curve and depth of the deck beams. These should be made of ¼in. pine. They are taken off by either of the above methods.

The tendency of light boats if to spread in width in building, to avoid which in a canoe, where a small excess of beam may bar the boat from her class in racing, the model and all the drawings are sometimes made about one inch narrower amidships than the desired beam of the canoe, and the sides are allowed to spread when the deck beams are put in, if they have not done so previously, as often happens unless great care is taken.

METHODS OF BUILDING.

While but few of the many different methods of building are adapted to the purpose of the amateur, a description of the principal ones will enable him to understand the entire subject more clearly. Of these, two are by far the most common, the carvel, and the lapstreak, also called clinker or clincher. In the first, usually employed for ships' boats, yawls, Whitehall and other boats, where lightness is not of first importance, the planks (six to eight on each side) are laid edge to edge, not overlapping, and nailed to the ribs or timbers that make the frame, the latter being spaced from nine to fifteen inches apart. To prevent leakage, a small thread of raw cotton, lamp wick, or in large boats, oakum, is driven into the seams with a mallet and caulking chisel, and the seams afterward filled with putty, marine glue, or if oakum is used, with pitch. To stand the strain of caulking and to hold the cotton, the planks must be at least three-eighths of an inch thick, which would be too heavy for a canoe.

In a lapstreak boat the planks lap over each other a distance of one-half to one inch, the edges being held together by rivets, some of these also passing through the ribs. In all cases the upper board laps on the outside of the one below it. Three objections are made to this mode of building—liability to leakage, difficulty of cleaning inside, and the obstruction that the laps offer to the water.

As to the first, it is almost entirely dependent on the skill and care used in the construction, and although a lapstreak boat may sometimes leak when first put in the water after drying out for a long time, it will very soon be perfectly tight. While the second point is an objection, it is by no means a serious one, and with a little care the boat may be kept perfectly clean, if not, a stream of water from a hose will wash out all dirt. The third point is the one most emphasized by the opponents of the lapstreak, but they overlook the fact that the laps, or lands, as they are usually called in England, are very nearly parallel, not with the water lines, but with the course of the water, which is largely down and under the boat. At the ends the lands are diminished to nothing, if the boat is properly built, and that they detract nothing from the speed is well proved by the fact that a very large majority of all canoe races have been won by lapstreak boats.

As to their advantages, they are at least as light as any other boat of the same strength, they are easily repaired when damaged and they will stand harder and rougher usage than any other boats of their weight without injury. The lands on the bottom protect it greatly when ashore, and if anything they add slightly to the initial stability.

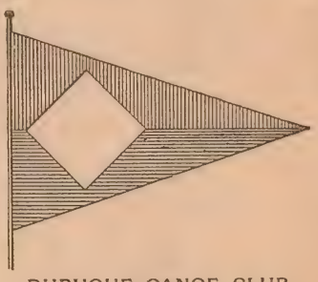
The oyster skiffs of Staten Island Sound and Princess Bay, boats from 18 to 25ft. long, lapstreak, of ⅛in. plank, are considered by the fishermen to be stiffer and to rise more quickly than smooth-built boats of the same model. As after some experience with different modes of building, we have settled on the lapstreak as the best for canoes, and the easiest for amateurs, we shall later on describe it in detail.

In order to obtain a smooth skin, canoes are sometimes carvel built, as before described, but of ¼in. stuff, and as this cannot be caulked, a strip of wood about ¼in. thick and 1in. wide, is placed on the inside of each seam between the timbers, the edges of the planks being nailed to it. This is called the "rib and batten" plan, and is largely used in Canada.

Another and similar plan, the ribbon, or more properly ribband carvel (not "rib and carvel") is used in Massachusetts and Connecticut for whaleboats, and in England for canoes. In these boats the ribbands are of oak or ash, 1¼x ¼in., slightly rounded on the back and as long as the boat. They are screwed to the moulds, when the latter are in position, just where the seams of the planks come, and as each plank is laid on, its edges are nailed to the ribbands for their entire length. When the ribs are put on they must be "jogged" or notched over the ribbands. In both of these methods the boat is improved if a strip of varnished or painted muslin is laid along the seam, under the ribband, but this is often difficult to do.

In a similar way the boats of the yacht Triton are smooth built, with a strip of brass inside each seam instead of a ribband of wood. While having a very fine surface these boats are usually not as tight as the lapstreak, and are more easily damaged.

In another method sometimes employed for canoes, the skin is double, the boat being first planked with ¼in. boards and then with a second layer, crossing the inner one. The first layer sometimes is laid diagonally, sloping aft from bow to stern with the second layer sloping the other way, so as to cross it nearly at right angles; a method used in U. S. Navy launches and lifeboats.



Sometimes the inner skin runs across the boat, and the outer fore and aft, as in the well-known "Herald" canoes, and sometimes both run fore and aft, the seams of one skin coming in the centers of the planks of the other, rivets being placed along all the edges, a method of building followed also in some of our largest cutter yachts.

With either of these methods a thickness of muslin is laid in paint between the two skins, and both are well nailed together. While making a very strong boat, it is often heavy, and when water once penetrates between the skins, as it will in time (with the thin plank used in boat building), the leaks cannot be stopped, and the wood will soon rot. Another serious objection to it is the great difficulty of making repairs.

JERSEY BLUE.

NEW CANOE CLUBS.—We learn of clubs being formed at St. Lawrence, Fulton and Rondout, N. Y.; St. Paul, Minn., and Chicago, Ill. This speaks well considering the recent weather. Canoeists are still alive and looking for spring. Send in your signals to FOREST AND STREAM as soon as possible.

THE LOCAL MEET.—Mr. Smith, of Newburgh, has laid out courses on the ice opposite to the proposed camp ground of one-half, three-quarters, one, and one and a quarter miles. Also, a three-mile course for sailing. The course for paddling, one-half mile, is directly in front of the camp.

DUBUQUE CANOE CLUB.

ORGANIZED Oct. 1, 1883. Membership limited to eight canoe owners. Captain, Eugene A. Guilbert. Signal, upper half red; lower, blue, white square.

THE GALLEY FIRE.

PRACTICAL COOKERY.

THAT the canoeist has a heart is evident from the fact that the turnpike reaching it leads through the stomach; and the way to win it, I suppose, is by that prescribed route of old.

As the "galley fire" is kindled by that slightly traveled roadside, let us keep it burning, not smouldering, but blazing; and when the coffee pot is removed, let it be replaced by the kettle, the frying pan, or the gridiron.

That model rig, fixtures, water courses, etc., need discussion, and the discoveries and improvements therein spread among the brotherhood, is now evident, but let the cuisine keep pace with the advancement in other respects. Accustomed to our meals at home, with none of the attending trouble on our part, we are apt, in the contemplation of a cruise, to neglect giving them the consideration they deserve; 'tis hard to see a future appetite, with a full stomach. But it matters not how beautiful the hills among which you float; if the stomach is fed on badly cooked food, the "inner man" rebels, and the glory of the cruise has departed. Yes, the rills may murmur and the pine tops sigh, but

"Man is a carnivorous production
And must have meals,"

and neither murmurs nor sighs fill the stomach as they fill the heart; there is a sympathy between the last mentioned articles which will allow no encroachments from either side.

There are many dishes agreeable in camp which any one with two hands and a limited amount of wit can produce when on a comfortable cruise. By a comfortable cruise I mean one in which time is taken to "camp by the way," and not live on cold lunches, canned goods, Brunswick soup and hotel dinners, as is too frequently the case. There are those among canoeists (and very few I trust) who mark out a route, which would require four weeks to properly accomplish, and rush through in a week, as if after the pot of gold at the end of the rainbow. Then they tell with pride how many miles they made this day and that. They must be "through by daylight" or burst the boiler.

As the pot-hunter's enjoyment is measured by the weight of his bag, so is he delighted by the number of miles covered each day. He is in search of solitude, and the moment it is found rushes again for the society of men. There are times when camping places are "few and far between;" then this undue haste may be excusable. That a few such canoeists exist I know, and they do not tend to uphold the idea that the paddler is that independent individual upon whom the railroad and hotel have no claim.

If there is a being on earth who is not the "sport of circumstance," it is the canoeist; rain or shine neither sends him from any location or holds him to it if properly equipped. He is pre eminently a man of leisure; he has been "cast upon the waters," and the "world has found him after many days;" he is the product of the nineteenth century, a hurrying age 'tis true, though he came not in a hurry. "No fashion makes him ape of her distortions." He sails, he eats, he sleeps in his diminutive home, and why should not the art of cooking be as much a part of his education as the handling of his paddle or mainsheet. Do not the preparation and consumption of food bring their share of pleasure? Is not that a happy moment when, after a long paddle, you sit down with a ravenous appetite to a meal prepared by one acquainted with the mysteries of the cuisine. The novelty of the position brings it a charm, and when cruising in company does not the good cook command the respect and admiration of all? and when he has produced something extra to the "bill of fare" to tickle the palate, how he is looked up to in his wisdom, and how all wonder in what mysterious way the delicacy was produced. Ah! is he not their "bosom" friend? Verily, he rules the roast.

The best place to get ideas, certainly, is the kitchen; try it yourself under the supervision of "your sister or some other fellow's sister." Carefully note each operation, then, when in camp, you may trust greatly to the "necessity which compels you to do these things," as Virgil used to say. A good plan is to carry a small book and when anything pertaining to the "art" is found that may be of use, jot it down; when the eye rests on "Camp Cookery" in FOREST AND STREAM, or when you see any dish whose simplicity allows its production in camp, put it down in black and white; then when the "critical" moment arrives you are not bothered by the "thousand and one" minute difficulties which beset the amateur cook.

One of the most common products of every camp, canoeists or otherwise, is, or should be, a game stew. With it every one is familiar, and each cook, I suppose, makes it after a manner peculiar to himself. Its preparation is most simple, and that must be the reason it is never seen in print. There is one ingredient, however, which may not agree with the "knights of the paddle." That is time. A stew must be stewed. Fish, or eggs, or steak may be flopped in and

out of the pan in short order, but a stew takes time and a steady fire, and why not? Is the paddler always on the go? Does he never spend a quiet hour or two under the pines? He does not want a stew for every meal, but when he does what has an hour or two to do with it. This is the *modus operandi* with us:

Put game (anything from a goose to a sparrow, biped or quadruped), after being washed, into a kettle with pork and good supply of water, over a slow fire. Let boil well and skim. Cut up three or four good-sized onions, and add with seasoning, salt, pepper, parsley and summer savory. Boil slowly for one and a half or two hours, and when game is nearly done, put in pared potatoes, the large ones cut into two or three pieces. Mix three tablespoonfuls flour in a little water, and stir after thirty minutes, and all is ready. Water may be added when necessary.

Here is another simple method of cooking squirrels: Cut up squirrels into about four pieces each, put in frying pan with a few slices pork, and cover with water. Put cover over pan, boil well and skim. Cut a few onions over all, add pepper and salt, cover tightly again and cook to a nice brown. Remove meat, and to make gravy, dredge in enough flour to thicken, and stir well till blended. Q.

CHICAGO C. C.

Editor Forest and Stream:

The banquet of canoeists held at the Matteson House on Friday evening, Jan. 11, was a grand success in every particular, and the result, from present indications, will be one of the largest and most active canoe clubs in America.

Twenty-two canoeists were present, all but two or three being canoe owners. An informal reception was held in the hotel parlors till 8:30, when the company adjourned to the dining-room. In the center of the artistically arranged table, elevated on a standard entwined with smilax, stood a model Racine canoe some four feet long, filled with the rarest of cut flowers. This beautiful center-piece, the gift of Thos. Kane, Esq., of the Racine Boat Co., was deservedly much admired. The dinner and service were in keeping with the decorations.

About 10:30 the meeting was called to order, with Mr. J. F. West as chairman pro tem. The Chicago C. C. was organized and the following officers were elected:

President, Mr. G. M. Munger; Vice-President, Mr. J. W. Keogh; Secretary and Treasurer, Mr. F. R. Seelye.

A committee consisting of Messrs. Seelye, Pullen and Ellis, was appointed to draft a constitution and by-laws to be submitted at the next meeting, to be held on Friday, Jan. 25, at the office of Messrs. Thos. Kane & Co. on Wabash avenue. Other business was transacted and meeting adjourned at 12:15.

As a direct outcome of the banquet two new canoes have already been ordered and several others are being talked of. There is great enthusiasm and every prospect of an immense boom during the coming season. QUI VIVE.

CHICAGO, Jan. 14, 1884.

A NEW A. C. A. BADGE.

Editor Forest and Stream:

The question of a badge for the A. C. A. being now agitated, I have just forwarded to Commodore Nickerson for his approval, and afterward that of the committee, a design which I drew up last season with the intention of bringing the subject before the last annual meet. This I was prevented from doing on account of my not being able to attend the business meeting of the Association. The design consists of a rope arranged in a circle and tied at the lower side in a sailor's knot; inside the circle is a canoe with mutton-leg sail set (the mutton leg being the simplest for design), the prow and stern of the canoe and peak of sail touching the edge of circle; beneath the canoe, extending from keel to edge of circle, are the letters A. C. A., the whole being suspended from a double-bladed paddle by two single blades arranged vertically, one on each of the upper edge of circle. The design should be in gold, with the exception of the sail, which should be chased silver. This design combines as many of the distinctive apparatus of canoeing as can be worked in with neatness; represents the Canadian as well as the "States" method of propulsion, the sailer as well as the paddler, and combines a contrast of color in metal. I hope the Association will not adopt a burgee as a badge. It is so common and represents nothing. It may be worn by a patron of a militia company or a fire laddie, the engineer of a steamboat or a member of a secret organization, so far as the general public would know. Let us have a badge we may be proud of, as typically representing the most perfect and manliest of all outdoor sports. ORANGE FRAZER.

COLUMBUS, O., Jan. 21.

THE SAIRY GAMP.—I have a letter from J. H. Rushton. He writes well. He has taken in your camp-fire and he has seen the Sairy Gamp in your office. He speaks well of her. She is still staunch and tight. She is a beauty; a corky light-weight. I can paddle her from the Battery to the Lower Quarantine, Swash Channel, without shipping a quart of water. My dexter pectoral to the canoeists who meet around your camp-fire. My next cruise shall be a rattling, racketing, canoe-down-stream tumble, from the meadow dams to Philadelphia. I reckon this will test the endurance of a canoe. I believe, on my soul, that I can cruise the Sairy Gamp from the Battery around the lightship and bring her back all right.—NESSMUK.

[Yes, the Sairy Gamp is tight. We filled her half full of water the other night and launched a yacht model by gaslight. There is a chance for some one to work up a poem.]

RONDOUT C. C.—A meeting was held at Rondout, N. Y., on Wednesday last to organize a canoe club, as there have been several cruisers there for some four years past. The following officers were elected: Commodore, Grant Van Deusen; Vice-Commodore, Jansen Rasbrouck, Jr.; Secretary and Treasurer, H. S. Crispell. The remaining members are C. W. Crispell, C. H. De La Vergne, C. V. A. Decker, F. B. Hibbard, E. W. Knapp and Julius H. Marsh. The club expect to have four or five boats at Newburgh, and at least three at the A. C. A. meet.

TORONTO C.C.—Mr. Johnson is having a 16×28 canoe built for next season, and with his 18×24 and open 16×31 will be well prepared to make a pace for all comers.

Yachting.

THE STAYING OF MASTS.

SINCE the springing of Ileen's mast a great deal of correspondence has been going on anent the subject, the principal burden thereof being an erroneous impression that spars cannot be as well held in a narrow boat as in a broad one. This is an entire misapprehension. There is no reason why the springing of masts should be considered a special weakness of cutters simply because one of them recently had a misfortune of that kind. Plenty of instances can be found in the history of last year in which broad boats met with the same mishap. But everything which happens to a cutter is at once laid at the door of her form, while similar troubles of broad boats appear to make no impression upon the public mind. The schooner Ruth not only sprung but carried away her foremast going into New Bedford harbor last summer in smooth water. The schooner Agnes sprung her mainmast upon being knocked down in a summer squall in smooth water in the Sound. The schooner Clytie was overtaken by a similar accident without even being struck by a squall. The sloop Schemer rid herself of her stick in New York harbor last fall and the Aueto did the same. Now one and all of these were beamy boats, some of them the broadest of their class. All had great spread to their shrouds, yet this was of no avail, for the sticks went by the board just the same. We might with just as much reason point to those casualties as "proof" that wide boats could not hold their masts, as they seemed to be continually springing and carrying them away upon very slight provocation.

The Ileen had some excuse for getting into trouble. She was caught in a winter blow and steep sea off Hatteras. That alone would palliate her case to a great extent. But Ileen's mast was sprung on the *after side*. Her chain plates did not pull up, nor did her rigging or lanyards strand or stretch in any manner, showing very plainly that the mast did not go for want of lateral support at all, but that it pitched over forward beyond the elasticity of the stick in direct consequence of the breaking of the iron strap of the mainblock of the weather runner tackle or "backstay." We have before us a photograph of that block showing the fracture as stated. It was, therefore, not for lack of spread to the shrouds that the accident occurred, but for the sudden giving out of support to the masthead from aft for which no amount of thwartship spread to shrouds could compensate. It is true that narrow vessels pitch through a somewhat greater arc than flat-floored craft, which bring up with a kachunk to each oncoming wave. But it is also true that a narrow boat pitches with much greater ease and cushioning, and that the masts of such boats are not as taunt. Hence it is likely that their mastheads whip through no greater arc than those of vessels of slower speed and acquire no greater momentum. At all events the difference is not material, and as likely sometimes to be against one type as another, according to angle of oscillation and length of spar.

Now to provide against accident, it is evident that the greater the angle between mast and backstay, the better can the mast be held. Narrow yachts with short lower masts offer a better lead to backstays than beamy boats with lofty spars. So far then from charging cutters with especial liability to springing spars, their sticks can actually be held to better effect than in yachts of great beam. Furthermore, the support from shrouds cannot be judged by a simple comparison of beam, but by the angle from the masthead down. A beamy sloop with lofty stick may show no greater angle than a narrow cutter with shorter lower mast. So far as we could judge by a view end on, the angle of the shrouds of the cutter Bedouin is exactly the same as that of the sloop Gracie in spite of the latter's excessive beam. Again, the midship breadth of a narrow boat is held well fore and aft, and regular "channels" in wake of the rigging add to her breadth, but a wide boat pinches in rapidly unless suffering from objectionable flare in the bow frames, and the mast of a cutter is also stepped further aft than in a sloop, so the difference in spread to the shrouds disappears to a great extent, and the effective angle of their lead is often as great in the cutter.

There is no more danger of Ileen's mast going square over the side than the mast of a beamy boat. In fact it is a physical impossibility if the work about her has been at all honest. And against pitching the mast over the bow she presents a better lead in her backstay than would be found in a broad boat. The recent ill fortune which overtook the Ileen was due solely to the giving out of some iron work, which, in view of the treacherous nature of all blacksmithing, is liable to happen to any yacht at any time. It must also be remembered that Ileen did not cut down her spars and butcher her rig as customary with our beamy yachts when fitting out for the foreign cruise. One thing can be carried out in beamy boats better than in narrow ones, presupposing the spread athwartships between deadeyes to be greater in wide boats. The after shroud or "swifter" can be set up further aft, allowing the boom to swing off to a given angle when sailing free. In this manner the after shroud can be made to serve somewhat as a backstay. But its lead as such is so manifestly unequal to that of the runner of a cutter that it cannot compare with the latter in efficiency.

So little weight is put upon the shrouds of a cutter for staying the mast, except in a lateral direction, that the rigging has been set up closer and closer right along. In old-fashioned boats of considerable beam, the fore and aft spread used to be 2ft. 6in., but nowadays this is reduced to 1ft. 6in., which serves just as well for lateral staying, while the jump and spring forward is provided for by a special backstay of good lead, in the shape of the runner and its tackle, and this can have a larger angle of trend more directly aft in a narrow boat than in a wide one, as before explained. This is not put forward as a "defense" of the Ileen. She needs no apologies. But it is meant to remove another popular misapprehension which is not borne out by the mechanics involved in the staying of masts. Rigging of narrow spread does not risk the mast at all. What it does risk is the pulling up of chainplates or topsides, as the strain upon these is greater than with more spread. This can easily be provided against in toto by cheap and simple, yet very effectual measures in construction, to which we have reverted often enough in these columns. Furthermore, a narrow boat is so very much easier in her lateral oscillations and general behavior than a wide, hard-bilged yacht, that it is still a question whether the pull on her chainplates would be greater even with less spread to the rigging. Cutters are proverbially economical in wear and tear aloft, and it needs only one day's sail in such boats to make the reasons self-evident.

NEW CUTTER.

THE details of the new cutter building by Lawley & Son for Dr. W. F. Whitney from plans by Burgess Bros. are as follows:

Length over all	35ft. 4in.
Length water line	30ft.
Beam on water line	8ft.
Beam extreme	9ft. 2in.
Draft	6ft. 6in.
Least freeboard	2ft. 7in.
Displacement, long tons	12.75 tons.
Iron on keel, long tons	6 tons.
Iron inside	0.5 tons.
Area amidship section	27sq. ft.
Area immersed longitudinal section	150sq. ft.
Area loadline plane	134.5sq. ft.
M. S. aft center of L.W.L.	1.5ft.
Center lateral resistance ditto	2.56ft.
Center buoyancy ditto	1ft.
Area cruising lower sails	987sq. ft.
Center effort forward C.L.R.	6in.

This handsome addition to the fast swelling fleet of cutters in America will be named Rondina (Italian for Swallow). She has full flush deck with quadrant companion hatch, and a 4ft. skylight over the cabin. The forecastle hatch will be of iron. A watertight well aft for the steersman will be 2ft. 9in. by 2ft. 4in., with the hatch to sail room abaft of it. The cabin is 11ft. long with 3ft. floor, and 5ft. 9in. headroom under the beams. Lockers and sideboards at ends of sofas, and the run devoted to stowage and clothes press. The backs of the sofas lift up and sling from above as bunks so that four seperate berths can be had for the night. There will be a porcelain cabin stove in the bulkhead; meals will be served on a "swing table," so that soup can be had in a gale. In the forecastle there will be two swinging bunks, which stow up against the side in daytime, icebox, china closet, cook stove, etc. This cutter will be used mainly for cruising, and will have large, cool, and airy accomodations for the hot summer months, it being well known that the cabins of a cutter are more refreshing than those of sloops with wide superstructures upon which the July and August sun beats down until the heat below becomes even more sweltering than on deck.

THE COST OF YACHTS.

TWO weeks ago reference was made in these columns to the cost of yachts here and abroad. In a conversation with the Boston *Herald*, Mr. Lawley, the well-known builder of Boston, expressed the opinion that we had overestimated the difference and that he could build for 15 to 20 per cent. above the English prices. This "interview" has since been going the rounds of the press in more or less garbled form. Now, we are not in the habit of making statements without the fats to back them, and if Mr. Lawley will undertake to duplicate the Ileen for one-fifth more than she would cost in England, we can give him an order on the spot and guarantee him half a dozen more during winter. According to the London *Field* a forty-ton cutter like the Ileen can be built for $12,000. That vessel here cost over $25,000, thereby more than justifying our statement as to the excessive cost of building fine yachts in this country. If Mr. Lawley will agree to build a new Ileen for $15,000, which is 25 per cent. above the figure given by the *Field*, we will be most happy to accommodate him with a raft of orders at once. But Mr. Lawley must also be able to sink $10,000 on each job and grow fat on it. People here do not understand what constitutes prime yachting work and finish. That the difference may be made clear we append below the average custom in America and England for so-called first-class work.

AMERICAN.	ENGLISH.
Soft plank.	Hardwood throughout.
Wood floors.	Yellow metal floors.
Iron keel fastenings.	Copper rod.
Iron spike and nail work.	Clench copper fastened.
Wood knees.	Iron knees.
Spiked floors and garboards.	Through bolted to keel.
Single skin.	Double skin or composite.
Plank waist.	Stanchion waist.
Bare bottom.	Coppered bottom.
Iron wire rigging.	Best steel wire.
Seven sails.	Fourteen sails.
Anybody's chain.	Chain to Admiralty test.
Light gear and meagre fittings.	Strong and very complete.

We might go on to enumerate a great many more things of the same kind. Of course all yachts are not built as stated above in either country, but it represents the general practice nevertheless. Add the amount of work entailed by more completely arranged accommodations below customary in English yachts, the greater attention to detail and finish in all parts, and there is very good reason why English yachts should be classed superior to our own. Of course we are making rapid strides in quality of build as well as in model, rig and outfit, and we do not expect to remain in the wake of our cousins very long in any respect.

A large, beamy and deep yacht of the Itchen type, say 26ft. loadline, 32ft. deck, 8ft. beam and 6ft. draft, with 5 tons lead ballast on keel, metal floors, hard wood all through, copper fastened, mahogany, teak and brass fittings, 14 sails for a full racing cutter's rig, with housing topmast and reefing bowsprit, anchors, tested chain, all fittings such as brass rudder cap, leaders, cleats, cavils, pin rails, best steel wire rigging and backstays, water tank, dingey and appurtenances of every kind except upholstery, linen and silver-ware, can be turned out by a crack English builder for $2,000. A similar boat equal in quality would cost all of $4,000 or more here, and without full plans and specifications she could not be turned out at all for love or money.

The little Mona, with English sails and recent improvements is held at $5,000. The amount expended all told on keel, spars, American sails and her fittings, in the first place, reached over $4,000. The Mona is a light displacement cutter of 36ft. by 8ft., and could be built in superior style for $2,800 to $3,000 abroad. The Orivo 50ft. by 11ft. 6in. cost here $12,000. She could be duplicated abroad for $8,000. The Vayu, of Boston, 31ft. loadline, with iron ballast and fastenings, cost $3,500. She could be duplicated in England, quality for quality, for $2,400.

CRUISING IN THE GEM.

Editor Forest and Stream:

Reading the account of Mr. Osgood's predicament with Gem reminds me of some experience I had in bringing Gem around from Boston. We were out in rather nasty weather, and had occasion to put reef in jib, when she came up in the wind. Captain called out to give her a little jib to get her off. I don't remember who it was had occasion to go out on the bowsprit; however, I am positive it was not the cook, who was holding coffee pot in one hand, kettle in the other, and frying pan with his teeth. I don't think it was that fellow whom the captain had just caught hold of by the leg in his attempt to make a full flood in that locality, and was just about to take a header; but it was that old veteran, Joe D., of the Jersey City Yacht Club, who went out on the end of bowsprit, and as he did so Gem got a full instantly. We went on about our business, fixing jib at our leisure. I know another thing or two about Gem. One is that she is the best boat of her inches, properly handled, in our waters or in Boston, and Mr. Osgood may well feel proud of her; she is worthy of his confidence. The other thing is, I would have those ordinary iron bolts which hold the lead to keel changed for gun metal, or some day she may drop her lead.

After our tussle with wind and sea for a night and day, necessary articles, as our cook can vouch for, including compass, binnacle and yawl, were all lost. I never will forget the look of despair and disgust that came on the faces of our cook and that other fellow the captain caught by the leg. "Breakers ahead," shouted the look-out. "Every one on deck," roared the captain. "Where is that life-preserver?" screamed the cook. The other fellow was looking around for the cuspidor. Finally, after considerable delay, the remaining crew got their oil skins and appeared on deck, time enough, as the captain said, to have run ashore half a dozen times. "Hard-a-lee!" Cook came up with life-preserver on and wanted to know if we had seen land. At that moment the fog lifted and we sighted Point Judith. Captain thought we would run for Newport, and word was sent down below to the cook, who immediately commenced to get his things ready to say good-bye to us as soon as that harbor was made. "Hard-a-lee!" again and again came from the captain. That evening we got into the quiet waters of Long Island Sound. Our cook wanted to know what time we would get to Newport. Next morning all hands reported for breakfast, an unusual event. After a delightful sail down the Sound we anchored safe and all well, having had the most pleasant sail in my life. So much confidence had the cook and that other fellow developed in the ability of our Gem, that they both suggested we continue our trip down to Florida. I am only waiting for the time of my bondage to expire before I will take another flyer at just such a boat as Gem, only a little larger, a little deeper, and a little more lead away down about eight feet.

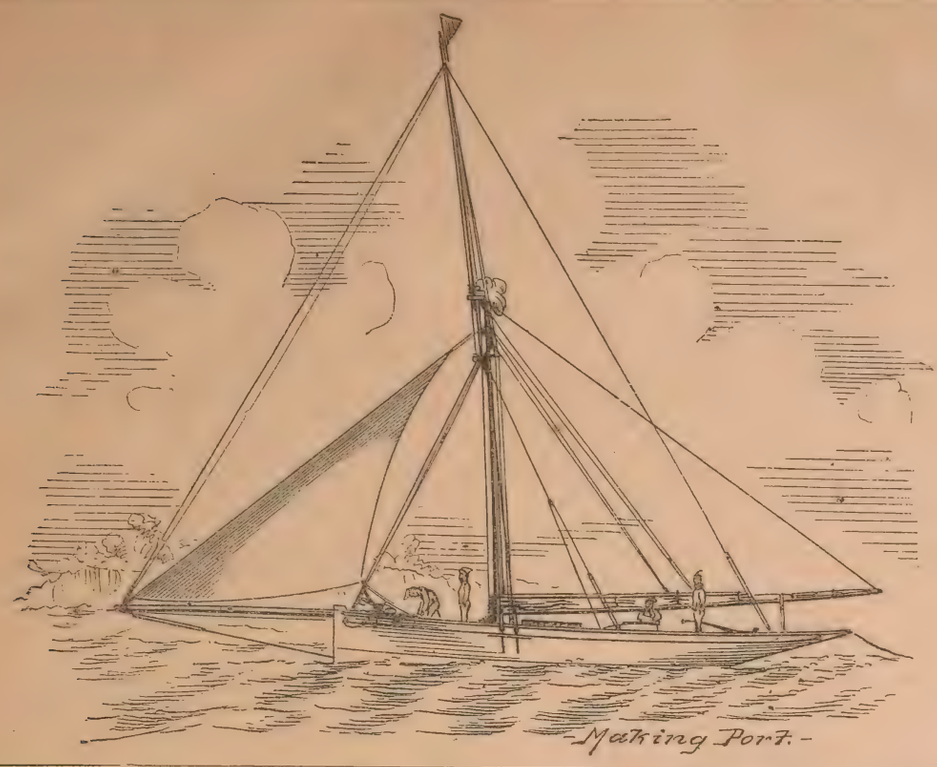
H. C. W.

EVIL EFFECT OF LENGTH MEASUREMENT.—That a length rule ostracises all forms but one, and that the most expensive and difficult to manage, is generally known. We find this well illustrated in the experience gained in Solent waters in recent years with the "length classes." It forces the greatest beam and depth with the greatest displacement and largest sail plan. An Itchen boat of 30ft. loadline has something like 13 tons displacement, 7 tons of lead and 7ft. 6in. draft, all of which is in excess of an ordinary cutter of same length. Already there is an outcry in Southampton waters against the "simple length" rule, and a demand that boats of moderate proportions shall not be driven to the wall by the monsters the length rule fosters, but that all shall be recognized through the adoption of a sail area and length rule, which will make the big ones pay for their size. We quote from a letter in the London *Field:* "I am glad to see there is a recommendation by the Y. R. A. sub-committee to introduce the length and sail area rule in the length classes. It is time that a fair chance were given to boats that are not of any extreme type. The length rule has already produced boats that are capable of carrying such large sails from their great stiffness, that they are almost unmanageable in rough water, being overwhelmed by the weight of their spars and gear. This stiffness is the result of excessive draft and beam, a boat of 30ft. long having a draft of 7ft. 6in. and beam of 9ft. 6in. or so."

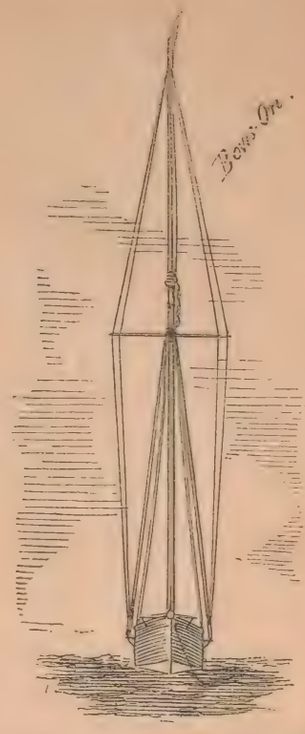
THE NEW RULE.—The sail area and length rule is working its way into favor abroad. It seems to be the only rule likely to class varying types, until the day when the equity of bulk shall be more fully understood. The Thames Sailing Club will arrange four matches for next season on purpose to give the new rule a trial in practice. On the other hand, *Land and Water* rather hastily gives an opinion adverse to the outlook for the new rule. But one fact like the foregoing is worth more than tons of opinion. For our part, we think it quite certain the sail area rule will come into very general vogue. All innovations start slow, like a railway train, and gradually gather momentum, just as we have seen in the change from centerboard trap to yachts of good depth in America. At first nobody would listen to the change, now everybody wants a deep boat. Concerning the silly proposal to substitute handicaps for time allowance proper, it was never seriously entertained by any one, and *Land and Water* is safe enough in its remark that "handicaps are not likely to become popular, and we neither expect nor wish to see them on many of the programmes during the coming summer."

SMALL BOATS.—There is or ought to be just as much and even more dignity attached to the ownership of a small yacht valued at a few hundred only as to the possession of the biggest frigate in the fleet. It is more creditable to take charge of your own boat and work her throughout the season than to lay off in an armchair and be driven about by a hired crew, who look upon you as nothing more than a victim, privileged to act as their paymaster. It is of more importance to nautical sport that one little twenty-foot yacht be launched and skippered with spirit than the building of a two hundred-ton schooner whose wheel never passes out of professional hands. Neither money nor tonnage should be the criterion in yachting, but the best models and equipments and the greatest proficiency in the theory and practice of seamanship, navigation and kindred acquisitions. The manly instructive and athletic sides of the sport should constitute the field for emulation, and not the squandering of money with ostentatious lavishness in the race for display or the indulgence in luxury, sensuality and mental imbecility.

KEELS.—We hear of a number of boats to be altered into keels this winter. It should be remembered that the keel of a flat-floored boat should have considerable rocker and be cut up to nothing with a long sweep from midships forward and a slight round-up to the heel in order to be effective. A year ago Mr. Rathborn altered the sloop Sparkle into a keel with a great deal of rocker. She proved very handy, much abler in every way, and lost none of her speed. Long straight keels are neither handy nor effective. If ballast is bolted up from below, as it ought to be in every good boat, the flitch keel of a centerboard can easily be strengthened to any extent by a keelson over the floors with chocks between, the keel bolts going up through all. The gain in room by such a change in a small boat is astonishing.



YACHTING IN HUNGARY.—On Lake Balaton there is at present great interest developing in yachting. A club has been organized and an English builder has established himself on the lake, having already turned out some sixty boats of all kinds. A large fleet is stationed on the Plattensee, including one schooner, several steamers, cutters, yawls and sliding gunters ranging from twenty tons down to one ton. Most of the yachts are owned by noblemen of the country, among whom yachting has become quite a fashion.



NEW MODEL.—We have seen a very handsome and well-proportioned model by "Ezekiel" for a large keel schooner likely to be built by a salt-water yachtsman accustomed to extensive cruising. Length over all, 105ft.; water line, 94ft.; beam, extreme, 20.6ft.; hold, 12ft.; draft, 12½ft. There will be 55 tons of lead on the keel. Mainmast, 88ft.; foremast, 83ft. Will carry staysail, jib and outer jib. The stem is plumb and the counter fashioned after the style of a cutter.

LIGHTHOUSE ILLUMINATION.—The results of several years of experiment with the electric light in French lighthouses seem to have been sufficiently satisfactory to encourage a more extensive use of the light for that purpose. Of the 332 lighthouses along the Atlantic and Mediterranean coasts of France, 45 will be furnished with the electric light immediately, and there is every prospect of an early addition to their number.

THE NEW STEAMER.—We learn that the new steamer building at Poillon's for Mr. Munro is one of the best-looking craft of the kind yet turned out in New York. The lines are due to Mr. Hubbe, who has made some handsome drawings, from which the yacht is being laid down. Mr. Hubbe has served his time and has seen experience abroad.

PUBLIC OPINION.—Says the Boston *Herald:* "There are many inquiries of builders regarding cutters and deep keel sloops, and a large number of new yachts of this type will be built before the next season opens. Mr. George Lawley says, judging from the letters he receives, that the days of flat centerboards are nearly gone."

A NOVEMBER DASH IN A SEVEN-TONNER.

[CONTINUED.]

AFTER driving through the Brothers passage sheets were checked all round, and merrily the cutter bowled along, going through clear as a knife, scarce leaving a ripple in her wake. The wind had sensibly abated with the sinking of the sun, and only at times did dark streaks chase over the broadening expanse of the waters as we flew across Flushing Bay. Abreast of Hunt's Dock, a sort of landmark, known to East River racers as the finish of many a hot contest, a black hull was made out steaming upon us rapidly. It required but a glance at the way she loomed up to make her out one of Herreshoff's far-famed high speeds. She stole up on our weather and screwed noiselessly by like a fleeting apparation, pursuing the even tenor of her way straight as an arrow without a quiver to the hull nor a throb from the engines. In form she was a beauty, and in style she was smart, for with the rig of a three-master and a yellow-washed stack, orthodox and à l'Anglais, there was an air about this steamer which put us in mind of the nobbiest screws to be met with abroad. She turned out to be the first Parmelia, but recently returned from Michigan waters, and now the property of Mr. W. P. Douglas, N. Y. Y. C. Like all the Herreshoffs, she was light as a feather, with a grace and pose peculiar to the Bristol conceptions, and with her high side, straightish sheer and long, easy body, a very good sea boat withal, who could drown out any of the sprawling, low-waisted things which New Yorkers have been brought up to consider good steam yachts. She was bound to Little Neck Bay, and had aboard a number of passengers, who looked lost and forlorn as they stood on the quarter-deck in great overcoats, shivering, against the bleak, cold scenery in the background.

A steam yacht is after all an anomaly which cannot easily be classed. There seems to be nothing for any one to do or with which to occupy one's mind, so you are forced to take it out in gaping, unless you are amateur mechanic enough to strip long togs and revel in grease and oily smalls, keep an eye on hot boxes, and listen for thumpings in the mysterious inner of cylinders and steam chests. Or maybe the doctor has recommended a warm climate and athletics, in which case you go in for a roast with furnace doors open and fire up with a shovel which I could scarcely lift. Or perhaps you dote upon the intricately scientific and love to riot in square roots, Marriott's laws, parallel motions, vacuums, cushionings, back pressures, slips of all kinds, helical curves, thrusts and frictions, and the endless snares and complexities of steam engineering. Or possibly you pride yourself on pilotical proficiency, and a trick at the wheel, sheering all over the river, with toots at the whistle to vessels going by, is the redeeming attraction for the mint of money expended. I can imagine all this being very great fun. Once upon a time I used to stand upon the bridge, lord of all I surveyed, and know the pleasures of skillfully navigating a steam vessel over trackless seas and along coasts unknown, with the chart and lead as their interpretation. But this listless screwing up a river and then screwing down again, without taking a hand in the mechanical management of the vessel whose decks you tread, is to me the feeblest kind of a pastime and as a sport quite beneath mention. Yet that is the style in which steam yachting is altogether pursued in this country, so after all, owning a tea kettle resolves itself into a match at doing the most gaping. The most tired, ennuied and helpless looking object in this world is the American owner of steam tonnage. Nothing can be a greater bore to him than "yachting," for it means only a crowd collected aft, the steward actively making the rounds, a bottomless consumption of viands and wines, with the pleasure of paying therefor, the usual contest of insipid jokes and lubbers' yarns, and a surfeit of swagger and exaggeration as to the speed of the particular rattletrap for which you happen to have paid double her value. I confess it makes me very tired to talk about the speed of steam yachts with their owners. Experience teaches me to divide their estimates by two and then there is generally margin left before hard pan is reached. It is conveniently customary to get knots and miles mixed up, and for land miles the owner has a weakness. The number of steam yachts in America which can maintain an average of 10 knots are extremely scarce. Those which can reach 12 knots can be counted on one's fingers, and few, if any, can make more on a stretch. With the exception of some Herreshoff launches, we have no such things as "high speeds" in the country and the 17 to 25 knot vessels exist only in the wild imaginative powers of "quick transit" schemers, "mastless dome vessel" quacks and like humbugs. Let the sanguine possessor of a skinny knife bladed as his taffrail log unbeknown to the builder, and with normal boiler pressure and his fanciful dreams of railroad speed will sink as fast as the mercury in the vacuum gauge of the condenser. For mere travel, as implements of locomotion from place to place, the fleet of so-called steam yachts in our waters will serve as well as anything else. But as affording indulgence in a maritime life for the sake of sport, give me the genuine steam cruiser, built to cover the greatest distance at sea upon a minimum of power and coal consumption. Put me on the bridge, in the engine room or even in the stoke hole, and I can see some point to the whole business. But ask me to own one of the low-wasted, light-draft knife-blade imitations, whose only recommendation is their visionary investment with a speed which cannot be maintained, and I respectfully decline to become party to any such imbecile picknicking. The steam cruiser as well as the steam cruising yachtsman are hardly yet to be found in America, but time will develop that sport with us in the near future, just as the present is witnessing the transfer of affection from smooth-water dawdling in sailing craft to blue-water cruising.

It is now high time I got back aboard the cutter. Night had fairly set in, and the silvery stars winked at us through the frosty atmosphere above. The moon had not yet risen, but the sky to the northward was lit up with flashes of bright borealis every now and then, as broad pale shafts warmed with reddish glow shot up from the horizon, illuminating feebly our surroundings for a few moments, then as suddenly expiring, only to appear again. We had been reeling off knots and fathoms with the quartering wind, keeping the Sunnyler light on our weather bow, sheering a trifle now and then to give a good berth to some lumbering coaster seeking hard to buck both wind and tide for an anchorage in Flushing Bay before trying the Gate on the next ebb. There was a frisky little ripple off Throgges Neck denoting the meet of the two floods, one coming through Long Island Sound from the eastward, the other, the favoring current, we brought with us pouring up from the Atlantic through the pent up rocky intricacies of world-known Hell Gate. We kept off half a point to be sure of clearing the black spar buoy until we could make out that sentinel in the dark. "Now boys, aft to the mainsheet," cheerily echoed fore and aft. In a moment three hands had collected, one threw off the turns and passed the hauling part along to the rest, while the fourth, our man with the iron grip, fumbled across into the lee waist ready to give head sheets a pull. Rapidly we closed in with the buoy which was bobbing up and down, and chasseying across in a double shuffle all to itself. As we reached up abreast, it was "In with the boom, trim flat headsheets." No sooner said than done, for the bracing air made all hands take to hard work with a will. It is strange how old yachtsmen tumble into their respective berths by intuition without any prearranged programme.

Our heavy weight selected the heaviest jobs and no one interfered. The others tailed on as required, and my long apprenticeship at unravelling knotty questions peculiarly fitted me for clearing turns and giving the gear a fair lead. Upon these lines we settled down at once, and all through the cruise the same policy was obeyed. Whether the heavy man thought it a square deal or not is unknown. As he did not grumble or kick, no one else was going to do it for him, and I disliked to disturb the peace of the family too much to get into his way. So that mainsheet cleat came to be considered my share, and quite an affection sprang up between us. If slacking away or preparing to flatten in called for no muscular contortions, the duty was highly responsible, as every one knows who has tied up his thumb in the turns or let the parts get away through his butter fingers. "Haul again, once more, another pull, so! belay," and the boom was in two blocks, jib trimmed down and foresail flat as a board, almost chafing the mast and clump blocks scraping the deck. It is always so. Never knew it to be different. The moment we had got everything two blocks, down came the wind in vicious blasts out of revenge, as if to take the starch out of us, and luff skipper out of his wits and boat up on the beach, or compel us to check all round and half spill to save our bacon, fetching to leeward way below your scientific calculations.

This time the wind got awfully fooled. It had tackled a cutter, and the cutter just smiled all over as she prettily hove down to business, never sailing plank sheer under even in the hardest of knocks. That wind retired disgusted. It had been accustomed to frightening the flat traps and making light sport of such flimsy game, had come for us cheeky fellows with topsail masthead in the muchly mistaken notion that we would flinch like the rest of its victims. We had to pinch for all we could to fetch up to our objective anchorage off Byles's Yard on City Island, and the yacht was rammed through everything without let up. Sheets were belayed all round, crew loafing about decks with hands perfectly at ease, and the skipper toying with his hand lightly on the helm. No one said boo to the blasts. No one cared a continental for the ire of old Boreas and the cutter cared less than anybody else. Every time she was hit she merely rolled down slowly and easily, looked higher than ever and gathered additional way, which she carried along through the flaws without check. Such sailing was glorious. It was her game and her play. A cutter sails best on her side, and the further over she is pressed the faster she foots and the more she soaks bodily out to windward as long as you do not overcrowd her with sail beyond what her form will admit to advantage. So far as her heeling is concerned, I will back a cutter to put in her best licks to windward when rail to, don't care what fairy tales theorists may compose to the contrary. I derive my conclusions from actual test, which knocks the stuffing out of theory every time. No one ever discovered that Madge "slid off" or could not hold her wind in the memorable tanning she inflicted upon the sloops some seasons ago, nor can any authentic cases be mentioned where a good cutter can truthfully be charged with greater lewardly tendencies than any other kind of vessel. Fact seems to be they have enough to hold on with and to spare, and maybe, as the lead goes down when the yacht rights, the top is cuffed over to windward as well, and then the pressure on the sails when heeled way over has not as much effect to drive sideways as when nearer the plumb.

Yes, but how do you explain the Newport race of last August? Well, we are now driving along nicely, fetching under the lee of City Island, so I may as well answer that question, foreign as it is to this log. Three cutters started in that race. No one found the least fault with Bedouin's close windedness, nor has it ever been hinted that she did not hold as high as the sloop Gracie after the leeward mark had been turned. No one found any fault with Maggie on that score, for she was beaten by Vixen through faster footing, and that only. But Wenonah had to make a hitch up to weather the committee at the finish, and upon this a great deal of fairy tale has been spun, all the performances of the same and similar yachts upon this and other occasions being entirely overlooked. They flatly contradict the charge that Wenonah lost the match for lack of weatherly powers like those of the centerboard sloops, and as we have it direct from credible source that Wenonah's masthead had to be nursed, and that she suffered more than the others through the backing of the wind, her defeat is sufficiently explained without drawing upon any imaginary shortcomings in respect to close-windedness which cannot be reconciled with numerous other tests and the fall races which followed.

But we are closing in on the land now and have to keep wits about for coming to. It was dark as pitch mixed with a little whitewash and difficult to separate beach and water, but the twinkling lights along the shore served as beacons. The wind got the worst of the fight with the cutter and had subsided, so that we skimmed the island at an easy jog. But where was Byles's yard, who could tell? No fences could be seen, no houses could be made out, nothing but a low wall of general blackness. All of a sudden the cutter got a last little blast over the trees, and the skipper being on his feet peering into darkness with the helm slack between his understanding, the yacht first bowed down a couple of strakes, then with a long sweep rounded up, slowed and rattled her canvas head in the wind. She had come to right off the yard which had seen her birth, like the steed who can smell his stable miles down the road. "Here we are, and here I am going to stay. If you galloots don't know where I belong, time I showed you." We did not argue the point with the yacht but took the hint. After dropping the lead in 2½fms. word was passed to stand by and let go the port anchor. It went to the cook's gentle persuasion. Then there was a short musical racket of rattling chain as it battled its way through the hawse hole and the active man, assisted by his cousin, had the jib on deck and the bunt snugged up at the same instant, the foresail having been taken off upon closing in with the land. "Hold on forward, wait till she takes it." A moment or two and the yacht gathered sternboard and then fetched up with a scarcely perceptible snub as she tailed to the full extent six fathoms allowed. The skipper stepped clear of the helm. The dash for that evening had come to an end. "All hands furl sail," was the next hail from the quarterdeck. "Topsail clewline, hand by the halliards. Clew up. Go the halliards, clew down!" After some tugging, the extent of which is known only to the active man, the jibheader was snugged down on the cap in a pucker, fisherman fashion, and so left for the night, as an early start was contemplated next morning. I broke out the gaskets from the sail-room below and passed them over the boom, beef forward getting a top up on the lift, while the skipper shipped the crutch to receive it. After dropping into proper housing, the mainsheet was hauled taut and made fast to prevent the boom getting adrift. In the meanwhile gear had been cast off from the jib, the cousin held the bag and others rammed the sail into a snug bundle, which was then tossed down the hatch into the sail-room for the night. Foresail was furled, the clew lifted clear of all by a tricing line forward the mast. Mainsail next received attention. Halliards were let go and the gaff came down by the run, with that clicking of the patent blocks which is sweet as music to the nautical ear. All hands ranged along one side, leech was passed in, topsail sheet not forgotten, and then with an "altogether, boys," the bunt was rolled up and lifted on top of the boom, the gaff settled riding the sail, and the gaskets speedily tied. "Cook down below. Clear up the decks fore and aft." Just imagine yourself half frozen through, hungry as a bear awakening from his winter's doze, smoke curling out the Charley Noble giving rise to gastronomic anticipations, and the last command which pipes down for the night sounds as welcome as the clock in the steeple when it strikes five to free you from the slavery of money grubbing for the day. "Every man a rope," so I turned to my old love, the mainsheet, and under the cover of darkness coiled it away against the sun in a tangled mass with the leadline. The active man, of course, had the riding light, regular Fresnel lense, trticed up to the forestay, burning like a miniature sun, shedding friendly beams over the forward part of the vessel, enabling me to suspect the grandest effort of the cook's life was being consummated in the forepeak below. Once more the good little ship was quietly riding to her chain in wonted fashion. We lay a cable's length from shore pretty well protected, with the best of prospects for peaceful slumber. Off our starboard quarter a sickly flickering denoted the whereabouts of a sloop, smack or freighter, as the only company close aboard. Other lights some distance off on our beam told of a batch of schooners and coasters waiting for purposes I could not divine. How they all make a living is to me a mystery, seeing the competition of endless miles of railroads ashore, and the numerous steamship lines afloat. But there will always be coarse freights, such as brick, coal, lumber and hay to collect from out of the way ports, for low freight rates, the loads all being poured into the vast maw of metropolitan consumption, never to be appeased, but ever expanding toward the colossal. The night was extremely fine, the edge was taken off the cold with the lull in the wind. The barometer had slowly and steadily been on the rise and fine weather was prognosticated for some days to come.

But what am I doing shivering on deck? The skipper had found his way below. Warm and homelike the cabin lamp shone forth through the glass of the skylight, and delicious odors rose from the companion. Eight bells had just gone. I was leaning back up to the boom in a reverie upon the romance of yachting, ever and anon glancing aloft into the gloom, seeking to follow the dim outline of the cutter's jaunty rig as it faded away in the darkness overhead. From the bottom of my heart pity went out for those benighted heathens on shore, to whom this noble, manly, hearty, life-renewing sport, with its roving and devil-may-care, its whole-souled Bohemian attributes and benign, broadening influences is a sealed book, into the leaves of which they will not peer, shuffling off this mortal coil without as much as a dip into the paradise, at the gates of which they all stand clamoring for that which is at their command within. Did I owe the fraternity of mortar and pestle a grudge and sought the anihilation of their fees; did I wish to starve them out of their living, I would spread broadcast o'er the land this new dispensation from the fount of life. Get afloat, get afloat, and don't be long in doing it! Away with you from the noxious smells, contaminated food, poverty-stricken atmosphere, petty cares and nervous worries of the hissing, poisoned swirl of city life. Turn upon your prison pens, fling aside the load which is luring to an early age and grave, and makes life one harrassing burden beneath which all but the most rugged sink and few succeed. Once more join bright glowing nature in her virgin purity, and wealth of powers to receive in turn from the one great Mother of All life which shall be life, and not its counterfeit, strength of body and force of mind, with the faculties for thought and action rescued from the dwarfish crippling of the baneful artifice imposed through the relentless race for wealth and vain display. Get afloat as fast as you can in a box, a scow, on a raft, in a yacht, anything you wish, so you meet Dame Nature to draw from her limitless supply fresh draughts from fresh sea breezes, freighted to the gunwale with balmy, rich ozone. One cruise breaks in the novice, the second sees all his fears and aversions overcome, the third he starts upon with expectation, the fourth has wrought an enthusiast from the most dismal beginning, and the fifth finds him laughing Medicus out of house and home, for he will no more know the stupid, dizzy topheaviness arising from a torpid liver, nor the dull pains of indigestion, nor listlessness and pallid hue of countenance, nor nerves unstrung, nor wakeful nights, nor any of the evils to which flesh succumbs in the contamination with that which is vile.

"On deck there; better come down if you want any grub," was shouted from the cabin, and with one jump I made for the hatch, tumbled down below, landed in my place, and went for scouse and dough—please pronounce duff, it's the nautical for it—in a way which would have thrown aback that unknown scribe who ventured the opinion, in an evening paper, that you could neither recuperate brains nor body aboard of a cutter. I won't say anything about the brains, perhaps there is no room for more, but as for recuperating the body,

just ask the cook! It was a caution how the grub was stowed below. Topping off with *caffé noir*, fire was started on pipes and weeds, and fragrant wreaths and rings gently steered their way to seek dissolution through the skylight overhead, as the cook cleared the wreck for the evening's entertainment.

The leaves of the swing table were collapsed and the four passengers coiled away in the four cosy corners of the cosy little cabin. Yarns then flowed upon yarns, and reminiscences took trick and trick with current topics until the clock warned all hands and a general move was made to berth for the night after the skipper had given a practical illustration in the delicate art of concocting eggnogg. By that perverse ruling of things or some base conspiracy the strongest potion of the aromatic composition fell to my share, and for a while after stretching the length of my berth in the after cabin there was a strange humming in the head, due to the eggs; but it could not have been long after the light was turned down before I fell a willing victim to the seductions of Murphy, cradled to a mellifluous lullaby played on the gamut of the deeply-tuned proboscis of the active man of the party and the swish of the wavelets close to my off ear. And now, if after this dose the gentle reader fails to drop into cast-iron slumber, he will not fare as well as did the crew who made this dash sometime last November. C. P. K.

KELPIE.—Mr. Winslow is having the centerboard ripped out of the Kelpie, Seawanhaka Corinthian Y. C., and an 18in. keel substituted. One more keel and one less board makes a difference of two in the footing. If the work is properly done, Kelpie will be much easier on her helm and need not loose any speed.

DAUNTLESS.—This schooner arrived at Fayal from Madeira in a leaky condition on Jan. 22. There is no dock or slipway in Fayal, or there was neither when we were there last, so the Dauntless will have to depend upon her own means for effecting repairs. She probably opened her seams in a rough sea.

BIGGEST KEEL EVER CAST.—Fay, of Northam, is building an 85-ton racing cutter for Mr. Jameson, of the Samœna. She will be 84ft. loadline and 15ft. beam, with 75 tons of lead in one solid chunk on the keel. This has been successfully cast, and is the largest on record.

SHARPIE RUDDERS.—Mr. Clapham writes that the balanced rudder was adopted because a skag was found to make sharpies slow in stays. Mr. Pike added a skag to his schooner Ellie with beneficial effect, and on the lakes a skag is universally used.

YACHTING NEAR PARIS.—The Cercle de la Voile now has 254 members, with 176 yachts, of which 32 are steamers. Total tonnage 3,862. Income $7,000 and expenses $5,600. Races sailed 39, for which $1,750 in prizes was given.

CUTTERS IN BOSTON.—The 28ft. cutter at Lawley's yard is planked up. Another cutter for Messrs. Taylor & Smith is nearly finished. The keel has been got out for Dr. Whitney's 30ft. cutter.

SOLENT WATERS.—There are twenty different sailing organizations on a coast line of twenty-five miles devoted to the interests of small yachts in waters adjacent to the Isle of Wight, England.

A POPULAR BOOK.—The third edition of Dixon Kemp's "Yacht and Boat Sailing" has been exhausted, and the fourth is now in preparation, of which further notice will appear.

BIG FLEET.—The Royal Southampton Y. C., of England, has 450 members, 230 yachts, footing up 19,000 tons, and $5,000 it does not know what to do with.

KNICKERBOCKER Y. C.—Second lecture will take place Feb. 6, corner Third avenue and 133d street, Harlem. All yachtsmen are cordially invited.

NEW YORK Y. C.—Will rent the premises known as the Municipal Building, Madison avenue, and occupy the whole house.

THE FOUR-BEAM CUTTER.—The new yacht illustrated last week was designed by A. Cary Smith, of this city.

THETIS.—This is the name chosen for Mr. Henry Bryant's 70ft. centerboard compromise cutter.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

W. E. H., Fairview, W. Va.—Address Estes & Lauriat, Boston, Mass.

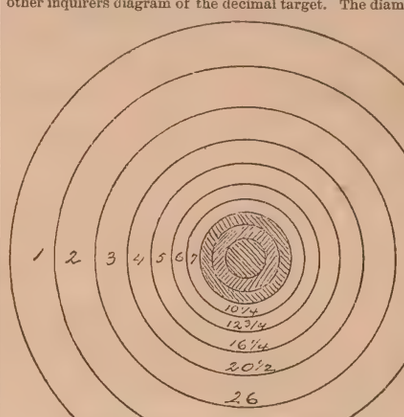
C. S. Y., Orange County, N. Y.—For fur dealers see our advertising columns.

A. J. S., Plumsteadville, Pa.—The firm is Schoverling, Daly & Gales, New York City.

R. P. A., Boston.—See FOREST AND STREAM for Nov. 8, 1883, for waterproofing receipts.

J. M. F., Middletown.—Consult Stoddard's "Guide to the Adirondacks." Price, 50 cents.

C. H. S., Dorchester, Mass.—If you want a gun for game shooting do not invest in an air gun, it will not give you sufficient penetration. The arm is fairly accurate at very short range, but one of the cheap Flobert rifles has all the good points of an air gun, and is much more effective. Go into some of the Boston gun stores and examine the guns for yourself.



J. A. P., Norfolk, Va.—Do the deer of this section of the country shed their horns every year, or not? Ans. They do.

H. L. B., Valdosta, Ga.—The note by "A Veteran Killer" in regard to an outlawed gun should be taken with 95 parts humor and 5 parts "salt."

L. K. M., Hastings, Iowa.—We have printed several communications from those who have used the gun named, and like it very much.

E. S. R., East Corinth, Vt.—You will probably find the deired information about Newfoundland in the book recently published by Rev. M. Harvey, of St. John's. We can supply it. Price, $3.

J. H. McE., Ohio.—We reprint for your benefit and that of several other inquirers diagram of the decimal target. The diameters of the

black rings are 3½in., 5¾in., and 8in. respectively; of the other rings as noted in the diagram. The distances shot at Walnut Hill are 500, 800, 900 and 1,000yds.

H. E. M., Hazelton, Iowa.—Does chokeboring a gun improve its shooting of coarse shot. Ans. It improves its shooting with all sizes of shot, so far as close pattern and penetration are concerned.

S. R. D., Brooklyn, N. Y.—1. For names of standard repeating rifles see our advertising columns. 2. Train your dog by the directions relating to retrieving in Hammond's "Training vs. Breaking," which we can supply you. Price, $1.

J. H. D., Poughkeepsie, N. Y.—To settle a question, please state what is the color of the barred owl's eyes. A. says they are blue; B. says yellow, the same as the horned and most if not quite all other owls. Ans. Both wrong. They are brown.

NEWSDEALER.—There are a number of anti-fouling paints in the market, to be had of ship chandlers in seaport or lake towns. Tarr & Wonson's anti-fouling paint is much used. A composition of verdigris for boats' bottoms can be had of paint dealers.

D. C., Toronto, Canada.—A. says a dog uses his nose to find the trail of a bird; he follows the trail and points on sight of bird. B. claims that a dog finds and points the bird by scent; as regards his pointing on sight it is quite accidental. Ans. B. is right.

DEER'S HORNS.—Two or three correspondents are informed that deer do shed their horns every year. This is the rule, to which there may be now and then a very rare exception. See the very full and explicit description of the growth of deer's horns, printed in our issue of Oct. 25, 1883, Vol. XXI., page 245.

COBWEB, Boston, Mass.—What is the present status of the N. A. K. C. Stud Book, Vol. II.? Ans. This is an enigma that we cannot solve; nor do we know whether, having passed through the vicissitudes of flood and field, it will ever see the light of day in time to be classed in any other category than that of ancient history.

W. K. N., Marissa, Ill.—A friend says he can kill the game on his own farm in or out of season, and take the case to the Supreme Court and gain the trial. Is the game law constitutional? Has it ever been tested? Ans. We are not aware that a case of this kind has ever been carried to the Supreme Court of the United States, but it has been decided by the Supreme Courts of some of the States. Some game laws may contain certain provisions which are unconstitutional; we believe the discriminations against non-residents to be so; but the State's authority to regulate the seasons in which game may be killed is unquestioned. This is one of the police powers of the State, like the power to forbid the sale of "bob" veal and skimmed milk. This power extends over all the wild game on private properties. See our issues of Aug. 9, Aug. 16 (particularly), Aug. 30 and Sept. 6, 1883, where the subect is discussed at length.

W. A. I., Liberty, Neb.—You can use buckshot in your new hammerless chokebore with perfect safety, if you will take the precaution to chamber the buckshot according to the choke. Push a rod in from the muzzle to the point of most constricted boring, put the buckshot in on it, and see how many will fit sung in a layer. Then when loading your shells make your layers correspond to this.

W. H. DuB., Pennsylvania.—Works relating to large game and the modes of hunting them are: Hallock's "Gazetteer" (which is perhaps best adapted to your purpose), price $3; Murphy's "Sporting Adventures in the Far West (unreliable and second-hand) and Van Dyke's "Still-Hunter" (very good for deer), $2. Caton's "Antelope and Deer of America" is the most exhaustive and reliable work on that subject.

C. P., St. Louis, Mo.—The Savannah, Florida and Western Railway (Savannah, Ga.) publish gratis a pamphlet descriptive of the parts of Florida reached by their lines. D. Appleton & Co. publish a book entitled "Florida for Tourists, Invalids and Settlers," by Geo. M. Barbour, price $1.50 or $2. C. K. Munroe (140 Nassau street, New York), publishes "The Florida Annual," which will probably best answer your purpose. Price 50 cents.

WESTERLY, R. I.—What is the use of a click on a fishing reel? I can see the advantage of a stop and drag but not a click, as I don't know what it is for. Ans. A click is usually a drag or brake, made to give a sound by which the angler can gauge the speed with which the line runs out. Most anglers love the singing of the reel, but there are those who prefer a silent drag. A click reel is too free running when the click is broken, but when in order needs no other drag.

N., Germantown.—Could you tell me of some good place to go this summer for shooting, either to camp out or to board? I would like to go to some place where it is healthy (as Colorado), where there is a variety of good shooting within tramping distance, as deer, ruffed or pinnated grouse, quail, ducks and geese. I only have July, August and September for sport, and would like to spend most of that time shooting. Ans. See article entitled "Where to Camp Next Summer," page 476, Jan. 10. It will be difficult for you to find a place where all the game named can be found within tramping distance.

W. G. M., Brooklyn, N. Y.—What would be a good State to live in for a person with weak lungs? I want to find a place where the climate is not changeable, but healthy, and where there is little or no cold weather. I also wish to get where there is good hunting and fishing, if possible. How would Southern California do? Ans. We advise you to consult a competent physician, or to write to some of the journals that give advice of this kind: for instance, *Dio Lewis's Monthly*, Bible House, New York. Southern California is very highly recommended; but we prefer not to take the responsibility of giving advice in a matter of this kind. It can be done intelligently only by some one who is familiar with the person and the place. Some doctors who cannot cure their patients send them off to a distant State as the easiest way to get rid of them.

BROWNING GUN BARRELS.—For the benefit of half a dozen inquirers we reprint the following receipt for browning gun barrels, premising it with the advice that the gun be sent to a gunsmith, who will do it better than an amateur can: "Tinct. of muriat of iron, one ounce; nitric ether, one ounce; sulphate of copper, four scruples; rain water, one pint. First, securely plug up both ends of barrels, leaving one plug in each end of sufficient length to be used as handles, then thoroughly clean with soap and water, after which cover with a thick coat of lime, slacked in water, and when that has become dry remove it with an iron wire scratch brush; this is to remove all dirt and grease from the barrels. Then apply a coat of the fluid with a rag, and let it stand for twenty-four hours, when a slight rust will have appeared; then take barrels and immerse them in a trough containing boiling hot water, after which scratch them well with the scratch brush. Repeat this until the color suits, which will be after three or four applications. When completed let the barrels remain in lime water a short time to neutralize any acid which may have penetrated. Take great care not to handle the barrels during the operation, for the least particle of grease will make bad spots."

H. G., Milwaukee.—Hallock's "Gazetteer" gives the following as the method of Indian-tanning skins. The skin is stretched either on the ground or on poles, and all fat or flesh removed. When well dried it is washed in soap and water to cleanse the fur; the brains of any animal are then taken and mashed into a paste with hot water, and this paste is thoroughly rubbed into the flesh side, and the skin hung out to dry. When dry it is scraped, and exposed to the dew for one night, and next morning rubbed and pulled until soft. Buckskins are made by rubbing off the hair with a horse-rib, while the skin is fresh, or, after soaking in a weak lye; then dressing with brains, and staining a reddish color in a decoction of Wasatchie bark. Alum and salt are very good, but alum is rather scarce in the chapparal, as also are doors and boards. Some stretch skins on the ground. Care should be taken, by the way, not to use too much salt, as it causes the skin afterward to absorb moisture too readily. Smoking a skin is done by first dressing with brains, sewing it up into a funnel-shape, and suspending over a slow fire of buffalo chips, or dry prickly pear, built in a hole in the ground. The tips of the funnel being pinned down close around the hole; a clear, calm day, is selected, and the smoking requires about two hours. It gives a velvet-like finish, and the skin never shrinks or gets stiff from wetting, but washes like cloth.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years **Humphreys' Veterinary Specifics** have been used by **Farmers, Stock-breeders, Horse R. R., Travel'g Hippodromes Menageries** and others with perfect success.

LIST OF SPECIFICS.

A.A. Cures **Fevers** and **Inflammation**, Milk Fever, Spinal Meningitis, Hog Cholera, **75c.**
B.B. Cures **Founder, Spavin**, Stiffness, **75c.**
C.C. Cures **Distemper**, Nasal Discharges, **75c.**

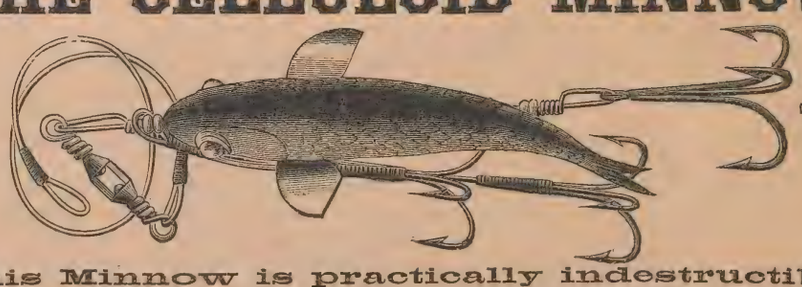
Veterinary Case (black walnut) with Veterinary Manual, (320 pp.), 10 bottles of Medicine, and Medicator, - - - - - **$8.00**
Medicator, - - - - - - - - - - - - - **35**



☞ These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of $5 or more.

Humphrey's Veterinary Manual (320 pp.) sent free by mail on receipt of price, 50 cents.

☞ **Pamphlets sent free** on application.

HUMPHREYS HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

THE CELLULOID MINNOW.

This Minnow is practically indestructible.

Mounted in the most substantial manner on hooks particularly adapted to AMERICAN WATERS. This cut shows the exact size of a No. 7. We keep the following sizes in stock:

Nos.	4	5	6	7	8	9
Inches long	2	2¼	3	3½	4	4½

Orders received from anglers where dealers keep a full line of our goods not filled at any price.

ABBEY & IMBRIE,
Manufacturers of Fine Fishing Tackle,
48 & 50 MAIDEN LANE, NEW YORK.

JAS. F. MARSTERS,
55 Court Street, Brooklyn.
MANUFACTURER AND DEALER OF
Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., $1.00; 120ft., $1.25; 180ft., $1.50; 240ft., $1.75; 300ft., $2.00; 450ft., $2.25; 600ft., $2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeeen, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft. long, $1.50 to $10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

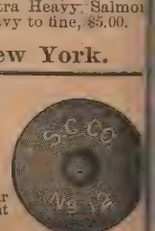
Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment o Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

For price list address



F. LATASA, 35 Broadway, New York.

STRONG CARTRIDGE CO.
NEW HAVEN, CONN.
—MANUFACTURERS OF—
Paper Shot Shells, Breech-Loading Cannon, &c.

Our Shells cannot be excelled by any in the country. Our Cannon is an entirely new thing, and the most complete yacht Cannon in the world.

SEND FOR PRICE LIST.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 7, 1884.

VOL. XXII.—No. 2. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

THE CAMP-FIRE VOTE.

IN our issue of Dec. 20 we reprinted all the "Camp-Fire Flickerings," and asked for a vote on their respective merits. The interest manifested in the voting has exceeded our anticipations. It was not thought that more than one thousand votes would come in. That number has been more than doubled. We have received two thousand and one hundred and twelve (2112) lists. They have come from a very wide extent of the FOREST AND STREAM'S territory. All the States have been represented and most of the Territories. From Canada and British North America, from England, from Scotland, Ireland, Germany, Bermuda, Cuba, Mexico, the mails have brought them; and one from the Sandwich Islands.

No conditions were made as to the character of stories to be selected. Each voter was asked to choose the ten which he thought "the best" and to write them in their order of merit. This was giving very wide latitude, and, as was to be expected, the ballots have shown very diverse opinions respecting what are "the best" of the ninety-six. Many of the voters have explained why they voted as they did. One puts a certain story at the head of his list "because it's a whopper." Another selects his ten "because they are all true ones, and the lies ought not to be counted." Of the seven winning stories, the first five are told as having actually occurred, and the last two are what the writer of the card just alluded to meant when he said whoppers. The list of winning stories shows this diversity: The first five of the seven are told as true; of the last two one is a Southwestern version of a Munchausen yarn, and the other a combination of "fish" and "snake" stories.

Probably few of those who voted thought of the vast possibility of change opened in the simple demand, that out of the ninety-six stories offered each voter should pick ten stories, arranging them in what appeared the order of merit. There was not only the wide range of selection for the choice of different numbers, but there was an arrangement of them as well, and this might differ. Thus in the latter case of arrangement the possibility runs up to 3,628,800. That is, for instance, ten persons might sit down to dinner for that number of consecutive days (if they should live long enough) and on no two days would the persons be placed in the same relative position. The same, of course, applied to the placing of the ballots on the list of ten.

The case in the "Flickerings" vote was, however, a different one, it was with a certain number of different things being given, how many changes can be made out of them, by taking any given number of quantities at a time. The rule in this case is a simple one, and in the problem immediately before us requires the multiplication of the numbers 96x95x 94x93x92x91x90x89x88x87, and the result is found to be 42,294,851,716,696,972,800, which is the total possible number of different ballots which the editor and the *Herald* expert might have had brought before them; but luckily, owing to a lack of voting humanity, that task was not set.

The method of determining the winning stories was announced as follows:

When a ballot is received, each story named on it will be credited with a certain number of units, determined by its position in the list. The story named first will be given the highest number, 10; the next one 9, the third 8, and so on to the tenth or last, which will receive 1. Then each of these credits will be transferred to the accounts of the respective stories, and the story receiving the greatest aggregate of credits will be adjudged the winning story, and to its author will be given the first prize. The story receiving the next highest aggregate will take the second prize, and so with the others until the total credit of each of the stories has been ascertained, and the seven prizes for stories awarded.

This has been done. For example: The story No. 36 was named in the first place on 130 lists, for each of which it received a credit of 10 units; it was named in the second place on 105 cards, for each of which it received a credit of 9 units, and so on through the other places on all the 868 cards on which the story was named. Its total score of credits was thus determined to be as follows:

SCORE OF NO. 36.

First Place.....	(value 10), on 130 cards.....	130×10=1,300
Second Place...	(value 9), on 105 cards.....	105× 9= 945
Third Place	(value 8), on 110 cards.....	110× 8= 880
Fourth Place...	(value 7), on 96 cards.....	96× 7= 672
Fifth Place....	(value 6), on 97 cards.....	97× 6= 582
Sixth Place.....	(value 5), on 69 cards.....	69× 5= 345
Seventh Place..	(value 4), on 78 cards.....	78× 4= 312
Eighth Place...	(value 3), on 73 cards.....	73× 3= 219
Ninth Place	(value 2), on 48 cards.....	48× 2= 96
Tenth Place....	(value 1), on 62 cards.....	62× 1= 62
Grand total of credits.....		5,423

By like calculations the scores of the seven winning stories were found to be:

LIST OF WINNING STORIES.

First Prize.....	No. **36,**	The Parker Gun Story.....	Total, 5,432
Second Prize..	No. **53,**	The Commercial Traveler.....	Total, 4,735
Third Prize.....	No. **31,**	Gus and the Cow.....	Total, 4,480
Fourth Prize...	No. **45,**	The Saw-Horse.....	Total, 4,346
Fifth Prize.....	No. **37,**	"Let's Put Both Gaffs In.".....	Total, 4,105
Sixth Prize	No. **93,**	The Peach Tree.....	Total, 4,017
Seventh Prize..	No. **42,**	The Snake-bitten Wagon.....	Total, 3,301

For purpose of comparison we also give below the detailed scores of the first fifteen stories. The table shows their order, the number of times each one was written in each place on the cards, the total number of votes it received, and the total value of credits obtained in the way explained:

SCORES OF THE FIRST FIFTEEN.

POSITION AND NUMBER.	1st Place. Value 10....	2d Place. Value 9....	3d Place. Value 8....	4th Place. Value 7....	5th Place. Value 6....	6th Place. Value 5....	7th Place. Value 4....	8th Place. Value 3....	9th Place. Value 2....	10th Place. Value 1....	Total No. of Votes.....	Aggregate of Credits.
I.....No. 36..	130	105	110	96	97	69	78	73	48	62	868	5423

No. 1, 1,494; No. 3, 1,317; No. 8. 1,257; No. 9, 1,461; No. 13, 1,626; No. 14, 2,067; No. 15, 1,278; No. 16, 1,183; No. 17, 2,412; No. 18, 1,824; No. 22, 1,533; No. 23, 2,157, No. 27, 1,362; No. 29, 2,435; No. 34, 1,272; No. 35, 1,659; No. 47, 1,099; No. 48, 1,886; No. 56, 1,581; No. 63, 2,350; No. 72, 1,433; No. 76, 1,927; No. 86, 1,816; No. 88, 1,098; No. 92, 1,152; No. 94, 2,151.

The winning voters will be announced in our next issue.

Will the writer of the winning story, No. 36, please send name and address to this office.

YELLOWSTONE PARK BILL.

THE Senate committee on the Yellowstone Park have completed their bill, which will now be reported for amendments. As it stands at present, the bill provides that the Park shall be enlarged thirty miles on the east and ten on the south, while from its borders on the north and west a strip two miles in width is cut off. The extension on the east carries the Park very nearly if not quite over to Cedar Mountain, and thus takes in the headwaters of the Stinking Water, including the wonderful Clark's Fork Cañon so graphically described in these columns last winter by our correspondent "P." The strip of ten miles added on the south extends the bounds of the Park down to the neighborhood of Two Ocean Spring, but of course does not include Jackson's Lake or the Tetons, which we should have been glad to see within the reservation. The bill further brings the Park within the jurisdiction of Gallatin county, Montana, and provides for the use of troops to capture and expel law-breakers. It provides for the appointment of a superintendent and fifteen assistants.

The bill is thus an improvement on the previous law in relation to the Park. The increase in size of the reservation was demanded by public opinion. It should be made stil larger, but then, after all, half a loaf is a good deal better than no bread at all. The increase in the number of assistants is a good provision, but we hope that they will be carefully chosen and thoroughly well equipped, for if they are faithful and painstaking, their labors will not be light. The provision authorizing the employment of troops to assist in protecting the Park is very well, but the Honorable Secretary of the Interior had this authority granted him by last year's Sundry Civil Bill, and, although the violations of the law last summer were flagrant and open, we never heard that any troops were sent into the Park for the purpose of protecting its wonders, its game, or its forests.

The fact of the matter is that the care of the Park depends wholly, or almost wholly, on its superintendent. If an energetic and faithful man fills the place, he can do a vast amount of good. If he is slow and lazy, the law-breakers will have things all their own way.

The provisions of the bill in regard to game and fish are, we are glad to say, very stringent. The killing of either is absolutely prohibited under a penalty of not less than $20 nor more than $100 fine, or imprisonment for ninety days

As regards leases, the bill is generally like the old law: The Secretary of the Interior is authorized to lease for not exceeding ten years small portions of ground in the Park, not exceeding ten acres in extent for each tract, on which may be erected hotels and the necessary outbuildings; but such leases shall not include any of the geysers or other objects of curiosity or interest, or exclude the public from the free and convenient approach thereto, or include any ground within one-quarter of a mile of any of the geysers or the Yellowstone Falls. Only one tract shall be leased to any one person, association, or corporation. All contracts, agreements, or exclusive privileges heretofore made or given in regard to the Park, or any part of it, which are inconsistent with this act, are declared to be invalid.

And while we are talking about the Park, a word or two about the great-hearted Improvement Company, which tried so hard last year to acquire the whole reservation for its very own. This estimable association appears, from the reports which are flying over the wires, to be in trouble. In the first place, it is stated that Rufus Hatch, whose name was so prominently connected with the incorporation of this company, has been sued by it for failure to take up the $500,000 of stock to which he pledged himself to subscribe. Then we learn from the West that the property of the Improvement Company has been attached by a Livingston (Montana) trader, who supplied the Hotel Company with supplies and who is now unable to collect his little bill.

The Company and its principal organizers being in difficulties, they may perhaps have less time to devote to lobbying in Washington this winter, and so the friends of the Park may have less trouble in securing the legislation which is so essential to its protection. There is an old saw relating to the condition of things when honest men get their dues, which obtrudes itself upon us; but let that pass.

Our readers will watch with interest the efforts which will be made by the land grabbers and for the Park during the remainder of this session of Congress. Public opinion insists so strongly, however, on adequate legislation on this subject, that we cannot doubt that it will be had. The people demand that their Park shall be kept for them, and that it shall be carefully guarded from injury. Its geysers, its forests, its game, must be preserved for its owners.

OUR CANOE COLUMNS.

THERE is no special necessity of calling attention to our canoeing department. It speaks for itself. It is newsy, helpful, practical. We are doing now, and mean to do in the future, for the canoe just what we have so long been doing, are now doing, and will keep on doing, for the gun, dog, rod, rifle, trap and yacht. The readers of the canoeing columns ought not to be confined to canoeists. Canoeing, and angling, and shooting, and camping, and the study and investigation of wild life are all connected. The subjects are blend. Anglers will find hints in the canoeing columns, and canoemen may profitably read the angling columns.

In fact, our advice is to read the whole paper. Even the yachting man, once in a while, says something that landsmen may find amusing if not instructive.

But what we started out to say is this, that the sport of canoeing is in the ascendant. It is no transient "boom."

The canoe has found its way into popularity. It has come to stay. We propose to make the canoeing department of the FOREST AND STREAM so complete that it will be regarded by those who read it as a worthy exponent of the subject. Communications on canoeing are welcome. When you write up your log book send it in. Tell us of your outfit, culinary triumphs, news notes about routes, hints and help about fittings, handling, and the care of the boats. In short, put in your paddle and add to the momentum.

COLLAPSE OF LENGTH MEASUREMENT ABROAD.

THE recent investigations of a select committee of the General Council of the British Y. R. A. has made the clear and positive declaration that length entirely fails to fairly compare boats of different types. It sets forth that the largest boat on a given length has inherently the greater possibility for speed, and that differences in size are properly subject to taxation, inasmuch as they enable larger sail spreads to be carried and contribute to greater ability in performance.

In other words, the highest authority in Great Britain once for all officially subscribes to a fundamental proposition long known to every intelligent person, that increased length not accompanied by corresponding increase of bigness is not a true gauge upon which speed can be compared. The committee simply reiterates the old, old story that a forty-foot canoe is not a match for a forty-foot yacht several times as big, and that to tax a fifty-foot canoe for the extra ten feet is to tax her for presumed possibilities for speed which the canoe does not possess, because lacking the bulk enabling her to display the superiority hitherto wrongfully attributed to the extra ten feet of length. Hence, between the two, or between the small chittywee and the big Itchen boats of like loadline, the length rule "entirely fails" to equitably match boats which differ so much in size. There is nothing new or startling about such an enunciation. We have sought to make that clear all along. Simple as such a proposition may seem and self-evident as it is from examples in practice, it is strange and almost inconceivable that in this age any one can still maintain the equity of racing a small boat against a large one without an allowance, should they happen to coincide in the one special feature of length. Yet it is upon the crass and glaringly false assumption that like lengths afford like chances for speed, whatever the bulks may be, that the length rules of the day are founded. "All other things being equal," the committee says further, "the speed of yachts will vary as the square root of their lengths." But as in no two yachts are "all other things equal," no rule can be built upon an assumption which does not apply among vessels of a length but varying in "all other things," said other things drawing their existence from the varying bulks found on the same length. Very properly, then, the committee has concluded that the errors of comparison by length must be corrected by the introduction of some expression equivalent to the difference in bigness of the boats entered for competition. It is true the committee does not recommend measurement of bulk in so many words, but beats the devil round the bush in advising the measurement of sail in connection with length. As sail area, broadly considered, will vary with beam and depth, the sum total of the operation is nothing less than a rough equivalent to the multiplication of the three chief dimensions of a vessel, in plain words, a gauge of her bigness or bulk.

There are, of course, instances in which, through differing mechanical provisions for ballasting, the sail area rule will fail to compare correctly the bulks of two vessels, and to that extent the rule will exhibit faulty application in practice. Upon the assumption that every man attends to the best mechanical provisions for racing, and that a match should be truly a test of model, the new rule will work with approximate equity. Where, however, inferior ballasting or rig is brought to the line, the rule offers an allowance for such shortcomings, as the area of sail will be correspondingly less, and it may be supposed the vessel also crippled to the extent of the allowance she receives. As long as the time granted is not so great as to put a positive premium upon the butchering of rigs, the neglect of proper ballasting or the shrinkage of bulk, as in a sharpie for example, there need be no fear but that the sail area and length rule will be found to permit the classification of yachts of all kinds, and for that reason free play to every man's preferences as to the form most suitable to his objects apart from racing only. To the degree that the sail area and length rule approximates a measurement of bulk, it will work with equity. To the degree it fails so to do, it will be open to further modification in the future. As a final quietus to "simple length" and piloting a truer course to the ultimate haven, the conclusions of the British Y. R. A. have our approval, and those conclusions cannot be without immediate beneficial effect in our own waters.

ONE SATISFACTION.—One source of greatest satisfaction in the work of conducting the FOREST AND STREAM is the promptness with which its patrons meet their pecuniary obligations. Subscriptions are always paid promptly, we have no list of "poor pay" readers, whom it is necessary to coerce by editorial threats into paying up. We conduct our business on business principles. The rule is that subscriptions must be paid for in advance. The practical working of the rule is that they are paid in advance. Indeed, very many (in a continually increasing ratio) have taken advantage of our "long term" rates and forwarded $10 for a three years' subscription in advance. Perhaps the reason why subscribers to the FOREST AND STREAM pay so promptly is that the paper is worth the money. "Nothing very occult about that, you see."

IMPROVED SMALL ARMS.—The reports from Switzerland, given in our rifle columns, show that the little republic is struggling with the small arms question. In Europe it is a problem of immediate and pressing importance and none of the nations there can afford to fall behind in this department. It may safely be said that compared with the small arms here, there is a general aspect of antiquity about the arming of European armies. The metallic central fire cartridge is not in common use and unsatisfactory substitutes of paper are employed. The inventors and improvers are, in most cases, military men with very set and circumscribed opinions, and a disposition to reject, even without examination, anything coming from outside sources. In no department of human invention is there more necessity of full information on foreign progress than in this of military weapons, and no class seems less disposed to give and take than military-bred critics. A trip through American armories would be, no doubt, fruitful of good results to our Swiss experimenters.

BOOKS FOR OUR READERS.—Our notification some weeks since that we would send any book published on receipt of the publisher's price, has evidently been appreciated by our readers. We knew that to do this would be a convenience to a great many, but the number of those who have taken advantage of it has surprised us. So many of those who read the paper live in places so far from the bookstores that it is a real blessing to them to be able to write out the titles of the book required and send it to us to be forwarded to them. Moreover, in ordering a list of books it is a great saving of time and postage to have to write but one letter instead of half a dozen. Although the filling of these book orders consumes no little time and trouble, we will furnish any of the books published in the list in our advertising columns, or any other book published, on receipt of the publisher's price. We will also send any magazine or periodical on the same terms. The name of the publication desired should be written plainly and the order must invariably be accompanied by the money.

THE BROOKLYN WATER WORKS SCHEME.—A bill has been introduced at Albany which gives the Department of Public Works of Brooklyn power to enter upon any lands or waters in Suffolk county, and by paying a certain appraised amount, occupy the same in perpetuity for the erection of pumping works, reservoirs, conduits and such other appurtenances as may be deemed necessary. As Queens county lies between the city of Brooklyn and Suffolk county, it is to be presumed that the waters there are either insufficient, or not to be obtained. Suffolk county comprises the eastern half of Long Island, and has long been noted for its trout streams, which now are threatened with confiscation by the city. The bill specifies no particular streams, but allows the tapping of every spring and stream in the county. Added to this is a clause exempting all the works and improvements made in robbing the county, from taxation. The streams of Suffolk county contribute the greater part of the fresh waters to Great South Bay, the home of the "blue point" oyster, and to the influences of these streams is due the excellences of this famed mollusk. The trout streams of both sides of the island so dilute the salt water of the harbors that they make suitable spawning grounds for many species of coast fishes, and with the streams taken from them the bays would soon become as salt as the ocean. We hope that the oystermen, fishermen, owners of trout streams, and all who are interested in preserving both our inland and marine fisheries, will protest against this bill being passed in its present shape. The streams of Suffolk county add greatly to the value of property there, and if they are all liable to confiscation every time the Department of Public Works of Brooklyn may issue a decree, then owners of streams will feel insecure in their possession. The Supervisors of towns should at least have a voice in this matter.

AN INTERESTING SERIES OF EXPERIMENTS is described in our angling columns.

The Sportsman Tourist.

HOW DO THEY LIVE?

AYE, that is the question. How do they live—these bright-eyed wood-folk, that the human biped pursues and persecutes with dog and gun, not only in season, but with snares, traps, and all villainous devices known of men, out of season. And when at last the human persecutor lets up, nature comes in with a heavy fall of snow, topped with a sharp crust. The ground is inaccessible. The trees are covered with ice. The beechnut and thorn-plum are the size of marbles. Seeds and buds become balls of ice. How do they, how can they live?

Truth to say, a large percentage don't live at all. They die. Notably, the quail, who is the first of gallinaceous birds to succumb. The wild turkey holds out longer, but is beaten at last. And the beautiful, gamy, hardy ruffed grouse is the last to give in. But a winter like the present tries even his powers of endurance. How does he live?

Well, so long as there is no ice-glaze on the trees, he will live like a fighting cock. Four feet of snow with a crust on top does not beat him. So long as beechnuts, thorn-plums, and buds are not embedded in a thick coating of ice, he will keep in condition. But there are seasons (I have seen three of them), when nature chooses to envelope all her food resources in an ice-armor that no bird can break through. In such a season the ruffed grouse does not live; he simply dies. And he is a bird that you cannot help. You cannot feed him. Once gone, he is gone forever.

But you may, and can, feed the quail. Next to the grouse, he is our finest game bird. Feed him when and where you can. In a heavy ice-glaze at the north, he perishes by the thousand. But he thrives and multiplies on grounds where you would never look for ruffed grouse, and is first favorite with those who affect wing-shooting.

If the wild turkey were sufficiently prevalent to make him a common object of pursuit to the sportsman, I would accord him first place, as the most magnificent game bird on the list. Far ahead of the n'embu, the cassowary, or the capercailzie, the latter being the grandest game bird of Europe, but nearly extinct. But the turkey is fast becoming remote, and is soon destined to become phenomenal. He can stand a pretty hard winter; but an ice-glaze beats him. Once, in Southern Michigan, thirty-six years ago, I saw a drove of thirteen turkeys making their way to the southward. They halted in the barnyard, skirmished around for a few minutes in the vain hope of grain, took the lane that led to the main road, crossed the road, crept through the fence on the other side, crossed an open meadow and disappeared in the forest beyond. As they clambered over the single bar that divided the lane from the main road more than half of them tumbled over through sheer weakness. But they gathered up and went on. The snow was three feet deep, with a crust, and the thermometer 24° below zero. How did they live? Probably not one of them lived a week. Heaven be my judge, that I would have given my rifle for a bushel of corn that I could have fed them. But it was impossible. They went away to starve—after the manner of wild turkeys. During the same winter, quail, in bevies of fifteen to thirty, were found frozen *en masse*, packed snugly together, as they had huddled for warmth. Even the omnipresent and pestilent squirrel failed to raid the cornfields the next season. Grouse and quail were very scarce for years thereafter. How did they live? Well, the few that managed to pull through had exceptional feeding grounds, if birds; and, if squirrels, a supply of nuts stowed in a hollow tree.

Fifty-three years ago the 20th of last November there came a snow storm that lasted without intermission for nearly four days. This was in New England. When the storm passed away the snow laid thirty-six inches deep on the level. The weather changed and there came a rain, followed by zero weather. On the first of February roads were of no use. The farmer hauled wood across lots, over fences and through woods on a hard snow crust that made the best of sleighing. This lasted until the 20th of March without a let-up. It was a fine winter for business, but it nearly exterminated grouse, quail and squirrels in Eastern Massachusetts. During the previous October they had all been very plenty; one could scarcely cross an open field without flushing a bevy of quail. There were grouse in every thicket, and the average country boy could make a decent bag of gray squirrels with a club and a cur dog. During the following summer and autumn I was in the fields and woods a large part of the time, and did not see or hear a single quail, and only two gray squirrels. The remnant of the grouse family was represented by a few hard-billed, strong-winged old cocks, who had managed to make the riffle by burrowing under the snow and raiding the nearest orchards for fruit buds. But I do not recollect that a single clutch of young grouse were seen the following season.

In a winter like the present, with only three feet of snow, with two crusts, but no ice on the trees, the ruffed grouse is at home every day. You will not find him in the low-lying thickets and hemlock swamps. If you look for him where you found him last October you will be apt to think he has emigrated for good.

Follow me for a little and I will tell you just how he lives—and lives well, in a winter like the present. Two years ago it would have taken several hours of cold mountain travel to reach the little lumbering hamlet of Ansonia from Wellsboro. Now, we take a comfortable seat in a passenger car of the P. C. & J. S. Railroad, and make the trip in thirty-five minutes. The road has not been in operation long enough to destroy the wild features of the region; and, as we glide down the romantic valley of Marsh Creek we have a steep mountain slope on the left, covered to the summit by a dense growth of hemlock, the trees near the foot of the slope and on the narrow flat more or less weighted with large patches of snow. It is in these trees, under the snug shelter of these snow tents, that the grouse loves to hide, spending the greater part of his time in keeping himself safe and comfortable. As we are traveling westward, the high slope on the right, with a southern exposure, shows a different growth of timber entirely. There are few pines or hemlocks, but large thickets of scrub oak, birch and poplar, and here is where the grouse makes his living. So long as the buds of the poplar and birch are not enveloped in a thick coating of ice, he will keep in good condition, though every species of ground food be covered with four feet of snow and a crust on that.

Twenty years ago, on this very slope, I was following a doe's track just at night in bitter winter weather, and her cute ladyship chose to foil me by keeping along the side hill and in the thickest growth of small timber. There was a track-

ing snow of eight inches which concealed all treacherous, slippery sticks, and I fell frequently—always with head up hill. At length I got an extra noisy tumble, and three grouse darted out of a low poplar, scaled down the mountain on level wings, like hawks, and disappeared in the dense hemlocks below. On looking around I became aware that there was a rather large gathering of the birds in plain sight, and, despairing of a shot at the doe, I clipped the head off the nearest cock. He made a deal of unnecessary fuss about his head, flapping, drumming and turning back somersaults down hill, making the snow fly as he went. This started a few of the nearest; and, as I got in another and last shot, the stampede became general. It was interesting, almost exciting, to see the game, beautiful things, a dozen at a time, glide like arrows down the steep slope without moving a wing, and, as they neared their favorite trees, turn sharply upward, put on the brakes with a thunderous clatter, and disappear in the dense, dark foliage above. I am not going to say how many I think there were on the feed at that time and place. At least one hundred. Perhaps thrice as many.

I have had the same experience on the mountain side two miles below Ansonia, on the head of Asaph Run, or Long Run, and on the side hills along the Canisteo, in Steuben county, N. Y.

I only give these jottings as illustrative of how they live in the long, hard, close season. The sportsman puts away his shooting gear at the close of the open season, and it is only the woodsman and naturalist who takes to the forest in January and February to find out the winter ways of the elfin woodfolk.

Not of game birds and game quadrupeds alone, for these are few in number, and it is our selfishness that leads us to give precedence and importance to them at the expense of other woods dwellers quite as sagacious and interesting. The wildcat, the owl, the fox, each and all have hard work to pick up a respectable living when there is a deep light snow on the ground. The two first named often perish with cold and starvation. I am not sure that the fox ever does, though he becomes fearfully emaciated. The mink and weasel manage very well. The former is a skillful fisherman and the latter a capital mouser. Both are model poachers and pot-hunters. They kill as long as anything is left to kill, with no reference to present needs. They deserve neither mercy nor sympathy.

Then there are fortunate individuals among the forest population who, on a sudden contraction of woodland currency, can go into winter quarters and sleep comfortably until the advent of better times. These are notably the bear, the skunk, woodchuck and 'coon. They remind one of Calverly's lines:

> "Friend, there be those to whom mishap
> Or never, or so rarely comes,
> That at the very thought they snap
> Derisive thumbs."

And there are some few quadrupeds and birds that thrive in the roughest winters. I do not think the deer—when unmolested by enemies, is ever beaten by hard weather alone. While the hare, the rabbit and the red squirrel can afford to "snap derisive thumbs" at Siberian weather with a heavy ice crust thrown in.

I would like to say something about the muskrat, the most intelligent animal of his size with which I am acquainted. No matter whether he elects to pass his winter on a rattling trout stream, a river or a lake, his industry and forethought always pull him through in condition. He has one foolish attribute that militates against his general intelligence: he will continue to stick his fool feet into naked steel traps until he loses his last foot. I have caught an old rat by his fourth and last foot, the others having been left in traps. And once—it may be a hard yarn, but it is true—I shot an old male rat swimming near the shore without any feet at all. They had all been left in traps; and he was swimming very well on the stubs.

When I remember that I have murdered more than 5,000 of these bright-eyed innocents and stretched their skins for an average of twenty cents each, I am quite prepared for the gospel of evolution.

I shouldn't be surprised to know that a few thousand years back my ancestors wore hair instead of cassimere, and lived mostly in trees. NESSMUK.

Wellsboro, Pa.

MY CAMP-FIRE.

IT was such a fire as an old campaigner loves. Heaped high with lusty logs, it blazed merrily into the dark blue sky of the autumn night, and sparkled and flashed through the linden leaves which overhung my couch. And the more welcome, because unexpected.

I had taken the Kelpie, rather late in the afternoon, intending to row quietly down Central Lake to Bellaire, remain there over night, continue my journey down the Intermediate River, through Grass and Clam lakes, and take the steamer Queen, at the mouth of Clam River, for Elk Rapids, where I had business which required attention.

I rowed leisurely on, taking little note of time, until, as I rounded the point known as Buzzard's Roost, I perceived that the evening twilight rested on the lake, and that I had allowed the beauty of the scenery to interfere with the plans of the expedition. Then I reflected. If I should attempt to run the Intermediate Rapids by moonlight I could not disguise from myself the fact that, however seductive the performance might appear when viewed from a distance, there was a strong possibility that, just when I should come to the liveliest part of the entertainment, I might chance to find myself caught in one of the log-drives of Messrs. Richardi and Bechtold; "in which case," said I to myself, "I shall, in the language of our late lamented friend, Mr. William J. Snelling, have 'cooked up a pretty kettle of fish, and brought my calf's head to a fine market;' and, to quote another early acquaintance named R. Crusoe, there would then undoubtedly be 'the devil to pay, and no pitch hot.' These be the facts. Shall I, like the Danish rover, lie on my own proud deck, before the sea and sky? No, the deck is too short. Shall I risk the rapid? No. By St. Bryde of Bothwell, I will camp!"

It was the eleventh of October, the night was fine, and though my camp equipage was scanty, it yet comprised an overcoat, a tea kettle, and an axe, and provident hands had stowed the mess chest, or more accurately, the bucket, which usually accompanies the boat.

I scanned the serried lines of cedars along the shores, and the dark hues of the evergreens blended with those of the upland maples in one sombre tint. Turning my course, I rowed for the western shore, and after a time, shot silently into a shallow cove, backed by tall cedars; a fringe of reeds advancing to the waves. Seated in the stern of my light, narrow craft, I laid my hand upon a projecting branch, and strove to force the boat further into the reeds, when a startling rush of wings burst from the tangled thicket, and I loosed my hold on tree and paddle, and grasped my gun as a dark object whizzed close past my head. Twisting myself in the narrow boat, somewhat after the manner of Davy Crockett's owl, my gun swung into line, and the moonbeams glimmered for a second's space on the brown Damascus barrels, as they ranged upon the fast disappearing shadow. A stream of fire lighted lake and forest, and showed the outlines of the distant shores, and a silvery fountain sparkled up, some forty yards astern. "It is a duck, sure enough. I thought it was a grouse," was my thought; as I paddled alongside the floating object, and lifted it into the boat.

When at last I stepped ashore I found that, with one exception, I had made a good selection of a site for a camping ground, but this one was decidedly condemnatory. The leaves were soaked with the recent rains, and the density of the foliage had prevented the sun from taking any active measures toward preparing them for the couch of a lone wayfarer like myself. Now, wood and wave are to me as home, and this being the case, I am accustomed in the presence of Mother Nature to do much as I would if under the shelter of my own roof-tree, namely, to make myself as comfortable as the nature of the circumstances will permit. I have found much comfort in a bed of wet moss on Echo Island, in Lake Winnipesaukee, and also in sleeping on a flat rock, in the Indian "Nation;" but at this time I had the whole night in which to seek a couch, and all Michigan to find it in, and I turned my course toward the nameless island—most northerly of the three which adorn the lower portion of Central Lake. I had passed this islet scores of times, but never landed there. I reasoned, however, that if I should find as much solid land as the son of Godwin proposed to give Hardrada, the afternoon sunbeams should by this time have fitly prepared it for my reception.

The Kelpie grounded on a little beach of hard, smooth sand, and I stepped into the bushes and paused under a jolly old clump of basswood trees, with wealth of drift scattered along the shore. "Behold," quoth I, "this is the very place I have been hunting. Here will I camp, there build my fire, 'and the low shiver of the linden tree may bring to me a joy.'" Then rang the strokes of the hunting axe, and up against the spangled night there streamed a mighty blaze.

Now, thought I, as, half an hour after, I sat at meat, with a mug of tea in one hand, and the gambrel joint of the luckless bird before mentioned, in the other; this is something like. Talk about the banquets of the gods—nectar and ambrosia, or the beer and bacon of Walhalla. The highest hall in Gladsheim wouldn't touch the roof of my camp, and I would not give the hind leg of this mallard for the whole outfit of Olympus. I only wish that the professor, or the cashier, or the barrister, were here, or that "Nessmuk" sat fornent me, just over against the teakettle, with his beard wagging over my commissary department, and the fragrance of the Formosa floating up to his nostrils. Did you ask if that gentleman and myself had ever met? Not that I know of, but let him come paddling in the Sairy up to my camp, and before many minutes we should, likely, be as old acquaintances. Aye, and we'd have a night of it. We would gang up the glen with "Bonny Kilmeny," and we'd have the "Witch of Fife," and, mayhap, all the rest of the "Queen's Wake," and a shy at "Holy Willie's Prayer," if he liked, with, maybe a dab at the Talmud, and a dig at the Targum of Bere Oziel, and perhaps a screed or so from the "Devil on Two Sticks." Any other literary *morceaux* which our repertoires might furnish, would of course be in order. There is the ballad—the very mournful ballad of "Peter Gray," who—

> "Went trading to the West,
> For furs and other skins,
> And he was caught and killed, a-a-and drest,
> By the bloody In-ji-ins."

Do my ears deceive me? or did I hear from some unappreciative person the word "nonsense?" Yes, I was right. My dear sir, before you pass over in disgust the remainder of this paper, oblige me by remembering that the Kelpie and myself are at present in unquestioned possession of this island, the uttermost coasts of which may from this point be swept at any moment with grape and canister; and further, that our camp-fire was not built for your exclusive benefit. I readily admit, however, that as the elder Weller might say, the evening's discourse "werges" on the nonsensical. Thoreau said that going into camp was with him a solemn affair, and I believe that I appreciate his meaning, but I am happy to say that in this close communion with nature solemnity does not always come to the front, or even make itself unpleasantly conspicuous. Those who are "forced to drudge for the dregs of men," and all the rest of it, often manage during business hours to get enough sense drummed into them to last over an infrequent evening by a camp-fire. Were you, O man of the long and rueful visage, to be wrecked at this moment upon the shores of the islet where at present I hold supreme authority, you should be welcome. I would seat you in the place of honor by my camp-fire; would share with you my duck and dhudeen, and would sit silent and attentive to the wealth of wisdom which your lips let fall. Under certain limitations you should discourse of what might seem to you most instructive—Moschus or Marcus Antoninus, Bion, Bacon, or Brillat-Savarin. I bar the ever-increasing list of German metaphysicians from them, for this night at least. My camp-fire is sacred. Do you remember the old Scotchman's definition of metaphysics? "Weel, sawney, fin the mon wha hears disna ken what the mon says wha speaks, and fin the mon wha speaks disna ken what he says himsel', that's metafeesics."

Are you a scientific don? I would gladly learn from you. We would discuss the relative density of a half-baked, three years old army hard tack and a piece of porphyritic granite, and tell each other how the ptermiognastis builds its nest. Are you a speculator, or a man of commerce? I would sell you a town lot, or talk of the late extraordinary fluctuations in the price of putty. If you should—bad luck on it—prove to be a lobbyist or a ward politician, bent upon obscuring the light from my fire with the murky cloud which muddles the brains of your particular following, I would reach for my gun, and, first having seen that the charges were in a trustworthy condition, would look in the direction of your boat; and, while carelessly playing with the locks, would relate an episode in the life of the late Captain Simon Suggs, of the Tallapoosa Volunteers, which, in the language of that distinguished warrior, ran much as follows:

"He kep' up a most a dingnation growlin', t'well I rolled up my sleeves, which it was a tollable warm day, and my coat was off, and says I: 'You see that hos yender?' 'I do,' says he. 'He's yourn, aint he?' says I. 'He is,' says he. 'Then,' says I, 'if you don't want to be most boddaciously cet up, you'd better get atop of him, and make tracks.'"

The tea things having been cleared away, and the cloth removed, I knocked the ashes out of my pipe, and uplifted my voice in song. (I sometimes commit these indiscretions where there is no danger of being arrested for disturbing the peace and dignity of the realm.)

I was just in the midst of a Northland saga when my dulcet strains roused grave remonstrance from a flock of geese just passing overhead. Truly, thought I, even though "my voice has been tuned to the notes of the gun," there seems no good reason why I should scare the lives out of these unoffending birds. All hail, ye cleavers of the wind! Your ancestors on the Grand Prairie could have told you that the crack of my old muzzleloader, "Dora Dean," or a hail from the iron throat of its companion, "Punkinslinger," was even more dangerous, though perhaps less irritating to your sensitive natures, than the roar of the Aristophanic anapests you heard but now.

Those who may have chanced to read such papers as I have contributed to the columns of the FOREST AND STREAM will perhaps have observed that there is little bloodshed in them, and it is true that I have in a great measure outgrown any taste I may formerly have had for, mowing swathes through swarms of birds, or for pumping a Winchester rifle while a band of retreating antelopes should remain in sight.

My experiences in shooting and in fishing belong, for the most part, to the days when breechloaders were infrequent, not to say unknown, and were by most sportsmen regarded as a nuisance. We loaded quickly, however, in those times, and even now. My preference for a breechloader arises not from the rapidity with which it can be discharged, but from the readiness with which its charges can be changed or removed without firing. I have been a persistent angler, and have burned much powder in my time; and a man does not acquire skill in the use of firearms against game without some waste of innocent blood.

I may some day tell how "the deer was hung up before the camp," or of the grouse in countless hundreds which could formerly have been seen on any bright winter's day, sitting in peaceful enjoyment of the farmer's corn in the great fields of Central Illinois.

In my time, I have made some shots which, in one way or another, I thought remarkable. I think so still, but—have no fears. All sportsmen have done the same, and who believes the tales? While "Major Verity" lives I shall not publish mine. I should as soon think of telling you how with my red right hand I calmly choked to death a grinning bear, while the iron hilt of the bowie in my left, clashed against the cuspids and incisors of its wailing mate, and the keen blade caused such serious abrasions of the internal tissues, that the poor animal ceased its wailings and calmly gave up the ghost.

Almost any one can tell you how he caught his fish, or killed his game, and the story shall lose nothing in the narration. I am, nowadays, seldom disappointed, if I return with a brace only of birds from a shooting excursion, and it is a pleasure to remember that since mere boyhood I have not wantonly wasted life. He who goes forth amid the sights and sounds of nature, doth sadly miss his opportunities, if slaughter is his only mission. It is a case of "eyes and no eyes."

I toss more wood upon the fire, and merrily doth it blaze. The lines of light stream southward, and in the distance Lewis's Island looms. That is the place, as I suppose, where one should seek the sad and wandering ghost of the "rude, but comfortable camp," immortalized by the gentleman (I had written "the magnificent pestle-head," but erased the words), who makes, or made a certain guide-book devoted to a description of this portion of Michigan. Had I employed the term "pestle-head," it would have been advisedly, for, as the autocrat says of "boodle," it is a "diabolish good word." Nevertheless, had I in camp a "Thesaurus of English words," I might, perhaps, select another more fully expressive of my feelings.

Every copy of the aforesaid guide-book which has chanced to come under my notice states (I quote from memory) that at Central Lake will be found a "rude, but comfortable camp," and this is about the extent of the information concerning the lake and its surroundings, vouchsafed by the editor of this interesting periodical.

I believe that Frank Lewis did, six or eight years ago, build some sort of a shanty on his island; but it had gone down the stream of time before I saw its site. [N. B.—Nothing contained in the foregoing remarks is so to be construed as to convey the slightest intention on my part of giving offense to the editor of the guide-book to which I have made allusion. I like editors—they are harmless beings—and their knowledge is as the knowledge of Allah. I have seen several, and gazed upon them from a distance with wonder and admiration. There was S., of the Chicago *Alliance*—bless his little heart—who, because of the fact that during the season when the woodland leek appears above the ground; the butter, in localities favored with the presence of this plant, is often tainted by its odor; gravely, through the columns of his paper, informed the "moss-back" farmers that "salt, duly administered to the kine," would prevent them from eating this weed. He also volunteered the information that the air of Torch Lake was more healthful than that of the Intermediate Chain, for the principal reason that the first named sheet of water is so much higher, and therefore feels the Mackinaw breezes. Dear, dear. If I only could see that noble specimen of manhood carrying a surveyor's chain up the Intermediate Rapids, with a pound of leeky butter under his nose! I had been under the impression that Central Lake discharged its water into Torch, through some thirteen miles of river, lake and rapid, and was therefore the higher of the two. But we live and learn.]

The fire burns low—more wood—more wood; and up the sparkles fly; and I spread the sheepskin rug which I use as a cushion in the boat, and draw over my head the hood of my nor'west capote. The lindens whisper overhead, and the soft waves stir the reeds.

The mists hung lightly over the lake as I rose in the early morning light, shook myself clear from my heavy coat, and after mending my fire and setting the inevitable tea kettle about its business, prepared for my morning toilet. Looking through a low clump of brushwood, I saw upon the surface of the water that which attracted my attention. Stepping backward I reached my gun (having in my haste slightly disarranged my camp outfit), and moved forward, just as a couple of mallard ducks flashed up on sudden wing and sped away. No, they are too far; and without shooting at too long a range, I returned to the fire and at once perceived that all was not precisely as it should have been. Whew! *Omne tulit punctum qui miscuit utile dulci.* Just so—the useful with the agreeable; though why I should seek to

parade my slender stock of Latin I'm sure I cannot tell; but do you suppose that that old heathen ever camped out and managed to kick his sugar into his cartridges?

Breakfast is finished; gun, axe, overcoat and bucket each in its appropriate place, and hey for the swift, strong river. The Kelpie floats once more, held only by the tip of the old rock-maple paddle, which has guided me well in the long-gone years, amid the lonely beauty of the lordly hills, on the flashing foam of the Pemigewasset, and over the treacherous quicksands and the turbid current of the pestiferous Arkansas. Now, then, the old Canadian paddle song:

"Les pommes, les poires, l'arabe, les choux;
Les feines, y on a là bas partout."

KELPIE.

CENTRAL LAKE, Michigan.

BETWEEN THE LAKES.

Third Paper.

INCIDENTS OF CAMP LIFE.

WE carried with us during our travels a light hunting boat, the Wa Wa, which served us many a good turn. Our Indian boatman, Jim Kishkatog, and his companion, Dan Sky, carried it across to Beaver Lake the first afternoon we reached our camp-ground, and that night they killed a deer and left with us the saddle, and as long as that lasted the Judge nor the Greek Professor made any special effort to kill another. Indeed, according to the rule of law as laid down by the Judge one evening while sitting around our camp-fire, it would have been inexcusable, to use no harsher term, to kill another deer so long as a supply of steaks was in the cache we had made in the cool sand at the foot of a neighboring pine. "Some writers on sporting craft maintain that there are two laws," said the Judge, oracularly, as he puffed a cloud of smoke from between his lips and looked upward to the waving tops of the Norways, "two laws, the law of the land and the law of the woods. But these writers are guilty of a solecism. There is but one law—the law of the land. The mistake these writers make is in confounding an exception to a law with the law itself. The law is, that no deer shall be killed in the Upper Peninsula before the 13th of August. This is the 'law of the woods' as well as the 'law of the land.' And so it is the law that one man shall not kill another. But suppose a man is attacked by his neighbor? He may then kill that neighbor, if it be necessary to do so, in order that he may escape with his life, or even to save himself from great bodily harm. The books all lay this down as the rule. Suppose an enraged buck should attack a man and put his life in jeopardy. Might he not kill it and not violate the law in so doing? Certainly. Every jurist and moralist in the land would so decide; and they would predicate their decision on the necessity of the case. Necessity, then, we may conclude, rises superior to the law, or, to state the case in the language of an old and approved maxim, 'Necessity knows no law.' What state of circumstances or condition of things will amount to necessity may not be so easy to decide in every case. No Legislature by enactment nor any judge by decision has ever undertaken to define this necessity that rises superior to the law. It is like fraud in this respect. Judges and text-book writers scrupulously abstain from defining fraud, lest some rascal will invent a form of fraud that will be outside the scope of the definition. Every individual case must be tested by its own surroundings. What would amount to an overruling necessity in one place, might not in another. Thus, in the settled parts of the country, a man would not be justified in killing a deer in the close season for its meat, because beef, pork or mutton could be obtained. In the woods, however, it is different. Take our own case for example. We are nineteen miles from the nearest accessible habitation—Munising—and even there the pork is extremely fat and the beef tainted. Surely the necessity of the case would justify us in killing a deer for its meat. I do not remember of ever seeing a case reported in the books deciding this point, nor of a discussion of the question in any of the text books; but any jury of woodsmen would acquit us on the plea of necessity, I am very sure."

As soon as the Judge had concluded, the Greek Professor rubbed his hands in a pleased manner, and nodding his assent, said that he was "thoroughly convinced" that the argument was sound. "Indeed," said he, "I remember to have read something similar to it in 'Calvin's Institutes' or 'Edwards on the Will,'" he had forgotten which. This cordial approval and reference to those great theologians and controversalists pleased the Judge mightily, and he not only lit a second cigar, but generously extended one to the Greek Professor, though he knew that gentleman to be unalterably opposed to smoking.

As for myself, I said nothing, but it occurred to me that while our venison steaks were yet in plenty, both Judge and Greek Professor had each been poking around with gun on shoulder, ready to kill the first deer that showed itself. But our steaks were not only out now, but brook trout had become a little tiresome, and it was decided by the Judge and the Greek Professor that a clear case of necessity existed, and that we must have a deer at all hazards, and so we went one night "shining" for one. The Judge greatly deprecated this method of hunting. He said it was "undignified and unsportsmanlike." But it was insisted by the Greek Professor that if this were so, yet, as venison was a necessity, we could not be over-particular as to the method adopted for taking it.

I shall never forget that first and only night's hunt. As we coasted along the shallow shore, monster pikes and bass, blinded by the light, floundered in the shallow water and rushed terror-stricken to the deeper. From out the dark forest came at intervals, strange, weird sounds of beast or bird, that in spite of me sent the blood flush to my heart. The Judge held the paddle and the Greek Professor the shot-gun, while I sat between, with nothing to do but obey my masters for the night and keep still. But I never had such a task imposed upon me before. My throat tickled and I wanted to cough; my back itched and I wanted to rub it; my body was cramped and I wanted to shift it. I wanted to sneeze, to clear my throat, to rest my legs, and although I made no noise whatsoever, ever and anon there came from my two masters in shrill whispers: "Do—keep—still!"

From safe retreats along shore, unseen deer were heard to stamp defiantly a snort in terror, but none were seen till a late hour. We had passed the narrow strait connecting Beaver Lake with its west and unnamed neighbor, and were coasting around a mud-bottomed bay covered with pond lilies. I had been studying the heavens in an effort to keep awake. I remember that I counted the stars in the Northern Crown and traced the outlines of the Great Serpent, and looked in vain for the fiery Scorpio. Then memory left me, and the next I knew, we were coasting around a little brushy point, and there, close into the shore, stood an astonished deer—cream-colored it seemed to me and bright-eyed by the lantern's light. I felt the boat leap forward under me, as the Judge gave a strong stroke with his oar, and I held my breath in expectation of seeing a flash and hearing the roar of the death-dealing gun. But I heard nor saw neither. Another stroke, more powerful than the former, shot the boat well up to the bewildered animal. Now, Greek Professor, blaze away! But no, the Judge jabs his oar into the soft mud and gives one more strong push and at the same time he screams "S-h-u-t-e!" The deer gives one or two terror-stricken leaps and disappears in the brush, while the Greek Professor, sweeping the horizon with the muzzle of his gun, fires a tremendous charge toward Arcturus.

"Darn it!" exclaimed the Judge, as the last echo returned in a whisper from the distant hills.

"Don't swear, Judge," said the Greek Professor, in a tender voice.

And then the two hunters held a brief consultation, during which the faintest color of recrimination blushed to the surface; but it faded away at once, and in the best of humor we returned to camp.

It was midnight when we got there, and we were astonished to hear voices from the beach. Advancing to the crest of the hill, through the darkness we could see the outline of a boat and figures moving on the beach. I went down the hill with the lantern and discovered that our visitors were Indians. Five men were busy transferring bedding from the boat to the beach, and seven muffled women sat squat on the sand in solemn silence. After the bed makers had spread their reed mats on the sand and their blankets on the mats, I returned to our tent. Next morning three of the men came up the hill to our camp and we held an interesting pow-wow with them. We learned from them that they were from the Waiska Bay Mission, in the vicinity of the Sault Ste. Marie Rapids, and were on their way to attend a camp-meeting then in progress near Munising. Seven days before they had set sail, but calms and contrary winds had detained them. The day following the meeting was to close, but they hoped to get there in time for the final exercises.

One of these men, the Rev. Gerrit Smith, a Presbyterian minister, we found quite intelligent. At a former time he had carried the mail along this south shore of Superior and knew the trails as but few, if any, white men knew them.

Among other things, our visitors told us of a trout stream that entered the lake about three miles, they surmised, east of our camp. "We ate supper there last evening, and my father said there were trouts there," said the Rev. Smith. We had noticed on the map that a stream entered the lake below our camp and had talked some of making it a visit; and now, when we were told that it was a trout stream, we determined to go the first convenient day, and that day happened to be the Fourth of July. Early that morning we were awakened by a faraway boom, and we said, "That's thunder: it's going to rain." Boom followed boom, and although a dense fog enveloped the lake, we soon saw from the regularity with which the sounds came that gunpowder and not electricity was the cause. The Munisiugers were, as we afterward learned, giving vent to their patriotism by anvil firing. Providing ourselves with a good lunch, at an early hour we set forth on our journey. Our path was the wet sand along the beach, and we found it very slavish walking. The Greek Professor, a spry, short-legged, ambitious man, put the Judge and me on our mettle that day. The former, with his 220 pounds, plunged along like a porpoise in a rolling sea, and every few rods he took off his hat and mopped his forehead. His spectacles gave him great trouble, for the fog covered them with a mist, and he was compelled to frequently stop and cleanse them of it. I yet remember the quavering feeling in my rather slender legs as I footed it along in the yielding sand, in the wake of my rolling, puffing legal friend, and in sight of the ghostly-looking outline of the sturdy little Greek Professor.

Many articles we passed on the beach that morning reminding us of the dangerous navigation sometimes experienced on these shores. The wreck of a yawl some one had propped up against the bank. An oyster can, unbroken and containing its original contents, lay at the water's edge. A broken mast was half buried in the sand, and countless broken bits of boats' furniture told of past wreck and ruin. As the day advanced, the anvil firing at Munising ceased, but the fog increased. It rolled landward in great clouds. Twenty yards off my companions resembled specters, and seemingly from near at hand, but out of sight, came in quick succession shrill whistling from a steamer uncertain of her way. Once we stopped to inspect a hedge hog that we came across gnawing at a castaway pork barrel. The Greek Professor upended the barrel with the beast in it, and then quoted a strophe from a Greek poem at him, after which the Judge, not to be outdone, pelted him with some law Latin and, turning the barrel down again, he left the ugly creature to suck salt and comfort out of his barrel as best he could.

At the end of an hour we sat down on a log to rest and, after a few moments spent guessing how far we had come and how far to go, we resumed our journey. At the end of a twenty-five minutes' brisk walk the Greek Professor suddenly asked, "Where's the lunch bucket?"

Then the look that overspread the Judge's face was worth seeing. He had assumed the care of that indispensable part of our impedimenta, and had left it at the log where we had rested. "Darn it!" said he, and dropping his gun and his rod, he went back for the truant lunch. The Greek Professor and I went on and soon came to the creek, where we sat down and listened to the whistle of the befogged steamer. The Judge presently came rolling up with the unlucky lunch, and after a brief resting spell, we left the lake shore and ascended the creek, fishing as we went. A few hundred yards up we found the winding stream abounding in beautiful woodland views. Its sparkling and cool waters flowed between not overly high, but well-rounded wooded hills, that in places came close to the creek's margin. Plots of blue violets grew in sunlit spots, and clusters of delicate ferns waved in the little damp nooks set in the hollow sides of the hills. Moccasin flowers grew here and there upon the hillsides, and under the hemlocks on the hilltops, the Indian pipe, that beautiful waxen looking flower, was seen. The sun came out while we were on the stream, and its rays struggling through the thick foliage above, dappled the pools and illuminated the beaded ripples. Golden robins from the leafy coverts vied with each other in piping their most musical lays, and a cock grouse, alarmed at our too near approach, on swift and thunderous wing disappeared in the green woods. Seldom have I seen forest and stream present so much of wild beauty. And then, under the shelving rocks and logs and in the deep pools, trout of good size and rich in their coloring and gamy to the last, took the hook freely. But alas! This wilderness, the true home of water nymphs and dryads, was likewise the home of myriads of mosquitoes and "no-see-'ems," and their persistent and savage onslaughts drove us back to the lake shore, where we soon forgot the rippling waters and flower-covered hillsides and leafy woods and forest sprites, over a birch bark platter of freshly broiled trout.

The fog lifting in the afternoon, we saw a few miles down the lake, a steamer apparently anchored near the shore, which we subsequently learned was the same one that sounded the alarm whistle all morning, and that it had ended its career that same morning by blindly running upon a ledge of rocks and breaking in two. We also learned that the creek visited was known as "Seven Mile Creek," so called because it was seven miles from the Ahmeek-we-se-pe.

We had walked that day not less than sixteen miles (the Judge more than that), and for a man who a few weeks before had been doctoring for a "lump in his throat" and for one who, as the old weak-minded mendicant in the "Hoosier School Master" was wont to say of himself, had "tater head," the walk was a pretty good one. But a good many far more laborious than that we took while between the lakes, and we found ourselves daily growing stronger for the exercise. The Greek Professor and I were agreeably surprised to find the atmosphere of the region so invigorating and healthful. It was bracing at all times and in all places. The Upper Peninsula lies wholly between the forty-sixth and forty-seventh degrees, the same latitude as at Quebec, but owing to its lake surroundings the average of temperature during the summer months—June, July and August—is 57° to 68° at Quebec, 11° difference. With Lake Superior, 460 miles long, and nearly or quite 150 miles between its north and south shores opposite two-thirds of the western part of the Peninsula, with its waters deeper by a hundred feet than any other of the great lakes, and cold as spring water the summer through, and with the prevalent winds of the Peninsula blowing from off this great cold water sea, it is easy to understand whence comes the delightfully cool, pleasant and invigorating summer climate.

All the south shore of the lake, from Kewena Point down well on to Whitefish Point, three hundred miles or more, presents almost a continuous succession of healthful sites for summer resorts. In accordance with the fashion of to-day, thousands of summer tourists visit the northern parts of the Lower Peninsula, a region possessing a climate so delightful and healthful as compared with the climate of the great corn regions in the Mississippi Valley, that the denizens of that valley who go there think they have breathed the most salubrious air in the world. But the Upper Peninsula, when it comes to be known as well as the Lower, which it will when it gets a little more out of the woods and has its comfortable hotels, will present attractions so superior to the Lower, that I venture to guess that it will draw the great majority of Western summer travelers to it.

In the meantime we

"* * who love the haunts of nature,
Love the sunshine in the meadows,
Love the shadows in the forests,
Love the wind among the branches,"

will set our tents by the "pleasant water courses" of this new land, where we will "get the odors of the forest," breathe its unpolluted air, and beguile with hackle or gentle its unsophisticated trout.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Eleventh Paper—Folk-Lore.

THE OLD MAN MEETS A WONDERFUL BIRD.

AS the Old Man was walking in the woods one day he saw something very queer. A bird was sitting on the limb of a tree making a peculiar noise, and every time it made this noise its eyes would go out of its head and fasten on the tree, then it would make another kind of a noise and its eyes would go back to their place.

"Little Brother," cried the Old Man, "teach me how to do that."

"If I show you how to do that," replied the bird, "you must never let your eyes go out more than three times a day, for if you do, you will be very sorry."

When the bird had taught the Old Man the trick he was very glad, and did it three times, then he stopped. "That bird has no sense," he said, "what did he tell me to do it only three times for? I'll do it again, anyhow." So he made his eyes go out a fourth time, but alas! he could not call them back again. Then he cried to the bird: "Oh, Little Brother!" come help me get back my eyes." But the little bird did not answer him. It had flown away. The Old Man felt all over the trees with his hands but he couldn't get his eyes, and he wandered all over crying and calling the animals to help him. A wolf had much fun with him. The wolf had found a dead buffalo, and taking a piece of the meat which smelled, he would hold it close to the Old Man's nose, then the Old Man would say, "I smell something dead," and he would grope all around in hopes to find it. Once when the wolf was doing this, the Old Man caught him, and plucking out one of its eyes put it in his own head, then he was able to find his own eyes, but he could do the trick the little bird taught him no more.

Moral: Do as you are told.

THE OLD MAN RUNS A RACE.

One day the Old Man killed a jack rabbit and quickly built a fire to roast it on. Far off a coyote smelled the cooking, and coming up limping very badly, holding up one of his paws, he said: "Old Man! Old Man! Give me a little. I am very hungry."

Then the Old Man said to him: "Go away! If you are too lazy to catch your eating I will not feed you."

"My leg is broken," said the coyote. "I can't run. I am very hungry."

"Go away," said the Old Man; "I will not feed you."

Then the coyote limped away. Pretty soon he came back again and asked for only one leg of the rabbit.

"Here," said the Old Man, "do you see that butte way over there? Let's run a race to that butte, and whoever gets there first will have the rabbit."

"All right," said the coyote. So they started. The Old Man ran very fast, and the coyote limped along after him. But when they had got close to the butte the coyote turned round and ran back very fast, for he was not lame at all.

He had been fooling the Old Man. The Old Man ran back as fast as he could after the coyote, and when he got to the fire the coyote was sitting upon a little hill eating the rabbit.

"Oh, my little brother," cried the Old Man, "give me a piece of it."

"Come and get it," said the coyote, as he swallowed the last piece of it, and trotted off on the prairie.

Moral: Feed the hungry. Things are not always as they look to be.

THE OLD MAN PUNISHES A THIEF.

One night the Old Man sat by the fire roasting a piece of meat. It was a very large piece of meat, and he went to sleep before it was cooked. A lynx, which had been watching him, now crept up and began to eat the meat. The Old Man woke up, and seeing what was going on grabbed the lynx saying, "Oh, you thief," and he pulled off his tail, all but a short piece, and pounded him on the head, making his nose very short. "There," said he, throwing him out into the brush, "that's the way you lynxes will look after this." To this day the lynxes have short tails and noses.

[Note.—Many of the best legends which explain the different phenomena of nature are related with the doings of the Old Man, but unfortunately they are so indecent that they cannot be translated and printed.—J. W. S.]

Natural History.

WILDCATS.

THE name of "wildcat" is very generally applied to the two species of *Lynx* (*L. canadensis* and *L. rufus*), which occur more or less abundantly throughout the Dominion of Canada from the Atlantic to the Pacific. The French-Canadians call the smaller of the two (*L. rufus*) "chat-cervier," and the larger (*L. canadensis*) "loup-cervier," which latter name in the modified form of "loocervee" is used in the Maritime provinces to distinguish the larger from the smaller wildcat.

Neither of these animals can be properly called "cats," for although they are classed with the *Felidæ* and have numerous feline characteristics, they differ from the typical cats who are represented in the American forests by the panther, ocelot, etc., distinguished from the lynxes in external form by their more cat-like appearance, their short, glossy fur and long, tapering tails, the absence of long, black pencil tips to the ears, and the high forelegs—in lynx the hind legs are much the longer.

The correct vernacular name of *Lynx canadensis*, instead of "loup-cervier" or "wildcat," is Canada lynx, and the smaller of the two (*Lynx rufus*) is properly bay lynx, called so from the bay or rufous color the fur assumes during the summer, though the Canada lynx also wears a tinge of rufous in the warmer weather.

Among those interested in the subject there has been considerable discussion as to the validity of the species *canadensis*, some claiming that the differentiations were due to the differing conditions of environment. Even so close a student as Dr. Garnier has stated: "I have long been of opinion that those two varieties—species if you will—are one and the same; that *Lynx canadensis* is merely a more northern form of *Lynx rufus*, the variety being produced by climate and food."

There is a very good opportunity for studying these lynxes in New Brunswick, as both species are common here, and the result of my observations leads me to take friendly issue with the learned authority, just quoted, and to agree with those who consider *canadensis* a valid species.

Between the two there is certainly a very close superficial resemblance. They have much the same general form and coloration; the same high hind legs, rather long body, ears with long black pencils of hair, and short stubby tails tipped with black.

The two species can, however, be readily separated by a differential diagnosis. The Canada lynx—the loocervee of these Provinces—is much the larger of the two, and has longer fur, which, while not so fine in texture, nor so compact, as is that of the bay lynx, has a prettier appearance and feels more silky. The inner fur or "wool" of the bay lynx is yellowish at the base and the remainder is of light brown, while the inner wool of the Canada lynx is of a dull leaden gray for the basal half, terminating with rufous. In the Canada lynx the feet are very much the larger, both by measure and comparison, and are so thickly covered underneath with short close fur that the pads are almost entirely concealed, while in the bay lynx the pads are naked. In the Canada lynx the tail is dull gray, tipped with black, the black terminal patch entirely covering the end; in the bay lynx the tail is gray above and white beneath, the tip being about equally divided, black and white. The bay lynx has several black half-rings on the tail, above, and dark bands on the inner sides of the legs, both of which are wanting in the Canada lynx.

When met with in the woods the bold, fierce nature of the Canada lynx stands out in very marked contrast with that of the bay lynx, the latter lacking the courage as well as the determined energy and self-reliance of its cogener.

The apparent dauntlessness sometimes displayed by the loocervee has been the cause of much controversy on the question, "Will a wildcat attack a man?"

Judging from my own observations, I should say that the bay lynx will get out of a man's way if possible, and when cornered will act strictly on the defensive. Usually they skulk off at one's approach as timidly as a hare. I once followed one that was trying to carry off a lamb which was a trifle over-heavy for it, and whenever I came in sight the lynx would utter a short growl, pick up his load, and move on. At length, becoming over-fatigued it dropped the carcass, that it might more readily get out of my way, muttering some dissatisfaction as it trotted off.

As to whether or not a Canada lynx will attack a man, unless under aggravating circumstances, I do not feel justified in offering any positive opinion, although my own experience with the brutes would lead me to distrust them.

On one occasion I was walking on a logging road talking with a teamster when his horses, hauling a load a few yards in advance, abruptly stopped, giving a snort of alarm. Upon moving to the front we discovered a loocervee lying in the middle of the road some thirty paces beyond, his head turned toward us. While slipping a couple of heavy cartridges into my gun we moved about ten paces nearer and shouted several times to try the effect, but the loocervee paid no more attention to us than raising his head slightly and cocking its ears. A charge of buckshot put an end to any further trial of its courage.

At another time I was collecting specimens of small birds and had followed one, that I was anxious to secure, into a grove of heavy timber which was strewn with "wind-falls." I had just climbed over a rough pile of upturned trees, reaching about as high as my head, when a hare ran across my path, and about eight or ten yards off, paused to look at me; a fatal pause, for before it got under way again a lynx had sprung from an adjacent tree and pinned it to the earth. The loocervee, for such I saw it was, keeping one paw on the hare, at once raised his head and gave me a most unattractive look. The ears were thrown back, close to the head; the eyes were dilated, and flashed with fierce anger; the mouth was open, disclosing two long rows of large glistening teeth, while tongue and throat gave form to a rapid succession of spits and growls, which were not at all reassuring.

I have never had reason for considering myself more cowardly than the average man, but at that particular moment there came into my mind a strong desire that the lynx would go away and leave me alone. I found that standing face to face with an enraged brute, as large as a setter dog and more powerful, who seemed bent upon asserting by force his right to hunt undisturbed where and when the chances of the chase might lead him—to face such an one was not quite as interesting as I had heard it proclaimed. I would gladly have retreated, but the wall of dead trees behind me could not be mounted without turning my eyes from the lynx, and that I considered too dangerous an experiment to attempt, while piles of dead roots and brush on either side shut off all hope for a successful flank movement, leaving me no chance of escape from the brute without passing close to him—and I was quite as close, where I stood, as I had any desire to be.

It soon became evident that the lynx had no intention of retreating, and there remained no alternative for me but to fight. But what should I fight with? I had no knife; and although I had a gun, my only ammunition was "dust" shot, which is about half the size of No. 12. At that moment I remembered that in the left barrel was a cartridge loaded expressly for extremely long shots, containing a full ounce of "dust," backed by three drams of strong powder, and I resolved to try the effect of it. Without any definite idea of the probable result of the discharge, and in something of a drowning man's straw-clutching mood, I swung back my foot for a brace and raised my gun. As I glanced along the barrels I saw that the lynx had taken my movements for a challenge, and had crouched for a spring, so rapidly aiming for the space between his eyes I pressed the trigger. Simultaneously with the report I heard a short, fierce scream, and through the smoke saw the lynx bound into the air toward me, but ere he reached the ground he was dead.

My friend, James Straton, Esq., tells me of being one of a party who were followed for a mile or more by a lynx while they were walking on a wood road one night in the vicinity of Andover. The lynx sprang from tree to tree above them, growling continuously. Among other instances of their fearlessness of men which have reached me, I remember hearing some years ago of Colonel Wetmore, of St. George, having been attacked by two or three while he was out deer hunting, and though a keen knife and a strong arm saved his life, he was severely lacerated.

The food of both species consists of hares, grouse, mice, squirrels, etc., and such odd plunder as they can carry off from the barnyard. There is an idea current that they hunt in couples, separated some hundred yards or so, to drive the game toward each other, but the more experienced and reliable trappers with whom I have talked about the matter, think that this is an error. It may have arisen from the habit of the bay lynx of following on the trail of its more enterprising relative, and gleaning the scraps left from its feast; many a good square meal they find, for it is not an uncommon thing for the loocervee to kill simply to gratify its love of slaughter, and after sucking a little of the blood of its victim, to leave the entire carcass.

A few years ago a farmer residing near St. John had two or three sheep killed in a pasture quite close to his house on each night for several in succession. The carcasses were found with a few scratches on the quarters and a ragged tear across the throat, but almost undisturbed.

Many a graphic story of the wildcat's assault upon its prey is written on the snow. A dainty tracing, made by a wee mouse as it ran along, or the sharply defined foot-prints of a grouse, end abruptly just where the marks of four broad paws are deeply impressed; a few small patches of bright red color, and, perhaps, a feather or two complete the tale.

I once witnessed a fight between two male lynxes that was rather exciting. Sleeping under a "lean-to" I was awakened about sunrise by a prolonged scream of most unearthly tone—more wild and fierce than anything which had reached my ear before. "What is it?" I asked under my breath of the Indian who had slept at my side, and who was also aroused; he whispered back "Ahpeek-wuseekun," the Malisect name for the loocervee, at the same time pointing in the direction from which he thought the sound came, for after the opening scream there had ensued a continuous growling, which I thought came from all around the camp, and the Indian had divined my thought.

However indolent the red man may be when the occasion will permit, when his hunting blood is up he is no laggard, and my friend Lola was not an exception, for so soon as he had determined for certain the direction of the sound he started on the war path.

I was soon ready to follow, for one's morning toilet, when "roughing it," is never a very serious matter, and on tieing my moccassin strings and buckling my cartridge belt I was prepared for any emergency. We crept forward under cover of a clump of young firs which stood some thirty paces off from where he had slept; and in an open space beyond, not ten paces away from us, we discovered two large loocervees facing each other and some two feet apart, evidently bent upon settling an affair of honor, after the rules of their code; on a hummock a few paces beyond lay a female, presumably the cause of said "affair," stretched at full length on her side and watching the contest with an air of playful indifference as to the result.

Both combatants seemed in earnest and neither displayed the slightest sign of trepidation. They were occupied in a preliminary fencing when we came up, and their actions were closely modelled after those of a pair of domestic tomcats under similar circumstances. The arched backs and bristling hair; the right paws, with uncovered claws, raised to strike; the lowered ears and fierce glaring eyes, the spits and growls were all very much like those we may see and hear any summer night in the backyard; but when the loocervees closed they gave a scream peculiar to themselves.

Over and over they rolled, biting and scratching, being particularly active with their hind feet, and all the while growling or screaming. They fought in rounds, and during one of these breathing spells, having seen as much fur fly and blood run as I had any stomach for, we let our guns have a say in the matter, when the combatants employed their remaining energies in kicking the dried leaves under their feet, and the female started in search of some other mate.

MONTAGUE CHAMBERLAIN.

ST. JOHN, N. B.

THE LEAST BITTERN.

I AM not surprised that your East Onondaga correspondent has "more trouble" over your statement that the *Ardetta exilis* is not very uncommon, and yet you are right. The sly and retiring habits of the least bittern, from which, no doubt, it takes its "last name," *exilis*, are well calculated to keep even a keen observer in ignorance. I have had a casual acquaintance with the bird for twenty-five years, but my earlier interviews were limited to a brief glimpse of a yellow-brown bunch of feathers awkwardly flitting from an alder clump, at the head of some pond, in the spring. For ten years I was satisfied to be told by my companions in pike fishing that the queer bird which thus changed its lurking place on the near approach of our boat, was "a rail," "a mud hen," "a poke," or "a quak." Then I was favored with more light. In company with a friend, Mr. Henry Wainright, now the genial host of the Union House at Manasquan, N. J., I was one day tramping the salt meadows around Squan Inlet. It was in the spring, and although I am not certain now, I think as early as April. We were gunning without dogs, and probably with no definite game in view. Pretty soon, from the sedge at the border of a salt pond, there rose before me a bird. Its flight was not slow, but deliberate and tempting, a peculiarity of the whole bittern tribe. Any one who has started on the Absecon meadows the larger species, called by the natives "butter-box," "dunkadoo" and "hunchapunchy," will remember the expectant look that the bird always has when flushed from the grass, as if to say, "Are you never going to pull that trigger?" Well, I was tempted, and the bird fell. Another rose, and Henry yielded. We found that the meadows were literally full of them.

The apparent size of the bird and our ignorance of the proportion of feathers and flesh made us exultant, as one after another came to our pockets. We thought of the wonderful roast down, or mammoth pot-pie that our birds would make, for we had long known, what many who read this have gone hungry by not believing, that the flesh of all the *Ardeidæ* frequenting our coasts is palatable when the bird has had abundant feed, and the cook knows her business. Is it too much of a digression to say that after the "full of the moon" I would not turn away from a dinner of well browned "quaks" or even "pokes" for a common beef steak or a store chicken. But never mind. When we reached home and picked our game, we found that there was no need to call the neighbors in. The fifty birds that had afforded us so much sport on the meadows looked awful slim in the pan, and we were sorry that we killed them. I have never sought for them again on the meadows at that season, or seen them anywheres in such numbers. In fact, when I think of that day's work I imagine I feel a little as the "sportsman" does after a day's shooting of pigeons from a trap.

So I first made the acquaintance of the least bittern, and since that time I have met him every year, and learned that in all our fresh-water ponds, at the time the alder leaves are beginning to show color, a pair or two of them are likely to be found. How long they stay I cannot say, as I only seek their retreats during the time for spring pickerel fishing, but I suppose they breed here, as I know the green heron (*Butorides virescens*) does. A little caution exercised, and you can approach very near to them, near enough to see that they are a most beautiful bird. The plumage of the male is especially rich in the bronze-green lustre of its breast tints, and a pair of them mounted by Sauter, the taxidermist, made the handsomest panel group I have ever seen.

T. B. A.

HIGHTSTOWN, N. J.

PICOIDES ARCTICUS IN NEW ENGLAND.—*Editor Forest and Stream:* Your issue for Jan. 10, 1884, contains a note by Mr. W. A. Stearns, recording the capture of the black-backed three-toed woodpecker in Massachusetts. After giving the details, Mr. Stearns says: "Several instances of its capture in New England, and especially in this State [Massachusetts] are on record." Although right in the main, this statement is misleading, inasmuch as it does not go far enough. Dr. T. M. Brewer states (North American Birds, Vol. II., p. 531) that "Audubon says it occurs in Northern Massachusetts and in all portions of Maine that are covered by forests of tall trees, where it constantly resides;" and continuing, that "Professor Verrill says the bird is very common in Western Maine, in the spring, fall and winter, or from the middle of October to the middle or end of March." Messrs. Brewer, Dean, and others have placed on record from time to time captures in Massachusetts and elsewhere in New England, In the final volume of the *Bulletin* of the Nutall Ornithological Club, Mr. Brewster has given us an extremely interesting note, from which I extract the following: "An unusual influx of the three-toed woodpeckers into Eastern Massachusetts.—I am indebted to Mr. George O. Welch for the following interesting notes: Some time in the summer of 1860 a fire swept through a piece of heavy white pine timber in Lynn, killing most of the trees. In the natural course of events the charred trunks became infested with wood-borers, and during the following winter (1860-61) the place was a favorite resort of various kinds of woodpeckers. In what manner the news of the feast was advertised in the remote forests of the North is not explained, but certain it is that with the first cold weather both species of *Picoides* appeared on the scene. Of *P. americanus* only three specimens were actually taken, a female by Mr. Welch, and a fine pair by Mr. N. Vickary. *P. arcticus*, however, was actually abundant, and remained through the entire winter. Mr. Welch often saw as many as six or eight during a single visit to these woods, and numerous specimens were killed and preserved. Most of the individuals seen were females, the yellow-crowned males being comparatively rare. Since 1861 only two three-toed woodpeckers (both *P. arcticus*) are known to have been taken in Lynn." Although I have by no means exhausted the testimony, I think that I have given sufficient to show that the statement was misleading and that more than "several instances of its capture in New England are on record."—LOUIS A. ZEREGA (New York City).

[To our mind the most interesting fact in Mr. Stearns's note was the date of capture—August. As our correspondent states and the records show, it has been taken a number of times in New England, and this is known to every one who keeps abreast of our ornithological literature. The summer capture of this northern bird in Massachusetts is, however, certainly an extremely interesting note.

The Ground Hog Came Out.—As a sequel to the prose epic in our last issue, "The Court of Arctomys Monax," this report in the Baltimore *Sun* of Feb. 4 is in order: Saturday was Candlemas Day, and the ground hog, in accordance with time-honored tradition, came out of his winter quarters to inspect the weather and see if he should retire again for six weeks to avoid the rigors of winter or stay out and enjoy the salubrious air and gentle breezes of a moderated season. There is a universal superstition throughout Christendom that good weather on this day indicates a long continuance of winter and a bad crop, and that its being foul is, on the contrary, a good omen. The ground hog has been credited since pagan times with the ability to discern by an observasion on Candlemas Day the quality of the weather for the balance of the winter. If when he comes out to make his meteorological examination he sees his shadow he returns to his hole for six weeks. If he does not see his shadow he stays out, thus proclaiming to all men that the winter is broken. Saturday he saw his shadow and hastily retreated, thus demonstrating to many people the continuance of winter weather for six more weeks. The ground hog at Druid Hill Park was an object of great interest Saturday. The story published in the *Sun* last fall of the rough joke to be played on him was remembered by many who went out to watch his movements on Saturday. An area of ground near the zoological building in the park was walled in so the ground hog could not get out by burrowing. Over this was placed an elevated roof, so the weather prophet could not have the benefit of sunshine and shadow when he came out to ascertain the weather arrangements for the future. The ground hog came very near falling a victim to this joke. Mr. Henry Christler, keeper of Druid Hill Park Zoo, while discoursing on the subject to a representative of the *Sun*, said: "I looked for him to come out at sunrise, and had always heard he came out on Candlemas Day at that time. I watched patiently all the morning, and at 11:30 sharp he came slowly crawling out of one of his regular holes. He had not been out since he went into winter quarters, Oct. 20. He looked as fat and saucy as when he went in. He had an inquiring, intelligent air, and in the absence of his shadow seemed undaunted by the bright sunlight which did not shine on him. On Friday I threw some corn in the inclosure to tempt him out, but it then had no effect. After looking round for a little while he went to this corn and commenced eating. He sat up while eating like a squirrel, only more erect. A beam of sunlight fell slantingly through the inclosure, and in moving about for the corn the ground hog crossed it. He saw for an instant the shadow of his tail and a part of his body. This settled it, and he flew to his hole. He was out altogether about fifteen minutes. I am working round his premises and intend to watch his future movements closely. He has six weeks to stay in the ground on account of seeing his shadow, and his time will be up March 21. Until that time I will watch him every day from sunrise to sunset. He is the only one in the Zoo. We have had several, but they all escaped by burrowing. I shall not believe in the matter until the six weeks are out. If he does not come out before that time I shall believe in the ground hog. I have never watched one before; have heard of them, but never saw one until I came to the park. A great many persons were here watching for him to come out, and about a dozen ladies and gentlemen were on the look out when he appeared. They were much pleased, but the ground hog paid no attention to their exclamations. Some of the workmen at the mansion say that in the mountains, when the ground hog comes out and is satisfied about the weather, he barks."

Another Fog Rainbow.—I need scarcely say I was exceedingly interested in an article in the issue of Forest and Stream of Jan. 17, written by "J. H. D.," of Poughkeepsie. Now, of course I am willing to add an item from my own experience, which I was scarcely willing to make very public (I had, however, noticed it in our local paper) for fear that I might be thought as imposing on the credulity of your readers. It was my good fortune in my vacation last summer to take a canoe trip with Dr. G., of Brooklyn, on the lovely waters of the Madawasca, in Canada, taking a trip down stream of about 130 miles, with excellent fishing all the way. We had encamped at Cold Brook, at the foot of Squattuck (or Squa-took) peak. This brook runs into Squattuck Lake No. 3. It was a foggy morning in August, and as the mist was lifting from the lake I looked in the direction of the outlet and there saw a phenomenon I had never seen or heard of before, and called the doctor and guide to witness it. As the rays of the sun came through the mist a mile away there could be seen at or near the surface of the water all the tints of the rainbow in their order—red, orange, yellow, green, blue-indigo, violet—stretching a distance of about twenty rods in width. It was indeed singular to see these colors horizontally displayed, especially as neither of us had ever heard of the like before. I have thought it worth while to drop you a line concerning it, corroborative of the assertion that such things do exist, although some are very incredulous concerning it. But my eyes are A No. 1, and, like "J. H. D.'s," were not "glazed" or "befogged" by stimulants. My fog was at a distance; his was near at hand, it seems. There was no arch in mine, simply a band of colors like the continuous spectrum, lying horizontal. Will some scientist rise to explain?—C. Jacobus (Matawan, N. J.).

One Hundred Dollars for a Huge Green Snake.—United States National Museum, Washington, Feb. 1, 1884. —*Editor Forest and Stream:* The inclosed slip was cut from the *National Republican* newspaper of this city: "As a couple of gentlemen were riding down the Roanoke Valley, Virginia, recently, they saw a huge green-colored snake writhing and twisting at the root of a beech tree. Going closer they discovered it to be one of the horned species of the hoop snake. It had formed itself into a hoop by taking its tail in its mouth and rolled down the hill in pursuit of a rabbit or other small game. So great had become its velocity that it couldn't guide itself, and it had struck the tree with such force as to drive its horn into the solid wood to the depth of an inch or more, holding it tight and fast. There are a great many trees in the vicinity that have been struck in the same way, and they invariably die. So deadly is the poison that the leaves on young oaks have been known to wither within an hour after being struck." You will perceive there is still room for good missionary work in the benighted region from which the "huge green snake" comes. If any inhabitant of the locality would furnish to the undersigned at the National Museum a specimen of huge green snake from Western Virginia, possessing a veritable horn, a large amount will be promptly paid for it, in fact a dozen specimens will be purchased at $100 each. It is of course understood that we do not wish any of the small green snakes found in Virginia which are perfectly harmless and have no horn.—H. C. Yarrow (Cur. Dept. Rept. Nat. Museum).

Birds and Electric Lights.—Cleveland, O., Jan. 15.—*Editor Forest and Stream:* I send you a list of birds picked up under the electric light masts, which have come to my notice. Undoubtedly many other species have fallen victims, but these I name I have seen and handled. With one or two exceptions they were all secured between Sept. 15 and Oct. 15 of last year: Wood thrush, catbird, red-bellied nuthatch, titlark, black and white creeping warbler, blue yellow-backed warbler, Nashville warbler, Tennessee warbler, black-throated green warbler, black-throated blue warbler, blue warbler, yellow-rump warbler; Blackburnian warbler, blackpoll warbler, bay-breasted warbler, chestnut-sided warbler, black and yellow warbler, Cape May warbler, yellow redpoll warbler, golden-crowned thrush, Connecticut warbler (19 specimens in three mornings), scarlet tanager, red-eyed vireo, warbling vireo, blue-headed vireo, savanna sparrow, Lincoln's finch, white-throated sparrow, white-crowned sparrow, rose-breasted grosbeak, pewee flycatcher, acadian flycatcher, sanderling. If you think this list would be of any interest to your readers, insert it, please.—H. B. Chubb.

Ornithophilologicalities.—In the first number of the *Auk*, Prof. A. C. Merriam, in a paper entitled "The Coues Lexicon of North American Birds," criticizes with some sharpness this work. The review is written wholly from the standpoint of a philologist, and is entirely devoted to criticisms of the derivations assigned by Dr. Coues to certain ornithological terms. Prof. Merriam is a purist, and the very slightest variation from his standard of correctness in the etymology of any term, furnishes him with a text on which he preaches at length. Being purely a philologist, he does not appreciate the value of the work which he is reviewing, but devotes his whole paper to finding fault. He is hypercritical in his own special department, and has not a word to say about the vast good that has been and will be accomplished by the "Check List." It is scarcely necessary to say that in any matter where the pen is the tool to be employed, Dr. Coues is abundantly able to take care of himself. In the same number which contains the review of his work he prints a reply to the criticism under the title "Ornithophilologicalities." This rejoinder fairly bristles with valid and sharp points, which Prof. Merriam will have much difficulty in answering. At the same time, it is written in such good natured and happy style, and is so full of humor, that notwithstanding the appalling character of its title, it is very amusing reading.

Camp Fire Flickerings.

"That reminds me."

100.

TWENTY-FIVE years ago the present winter the first little band of pioneers had gathered in Colorado at and near the spot now known as Denver. They were in the heart of the wilderness, six hundred miles from other civilization; cut off in the winter from all intercourse and commerce with the States and almost as completely isolated as if upon an island in mid-ocean. Supplies were scarce, and they had to "rustle" for grub. This was largely supplied by hunting, and fortunately game was plentiful.

Among the settlers was one Andy Slane, a tough, illiterate man of about thirty years, much given to profanity. Upon one occasion he and several others went to the foothills near Platte Cañon for a hunt. Scattering out each went his way and Andy soon "jumped" a mountain lion with a couple of half-grown kittens. They were within speaking distance, but Andy courageously attempted a shot, when his gun snapped, leaving him helpless. The old cougar appeared to understand the situation and accepted the challenge. She moved leisurely upon Andy's works showing her teeth, and Andy's hair began to lift his hat. Meantime he was fingering at his gun trying to get a new cap on the nipple. But "haste makes waste," and time was growing precious when Andy thought a compromise might be best, and he sang out: "Look here you cussed old varmint, if you'll let me alone I'll let you alone."

Just at that moment one of Andy's companions happened to come over the ridge behind him—of course, out of his sight but in plain view of the cougar, which stopped, as Andy thought, in response to his proposition, looked steadily at Andy for a moment, then at the reinforcement beyond, turned around and slunk away looking back over her shoulder.

About that time Andy got his gun in order, or thought he did, and his courage rose accordingly. He made a motion to bring his weapon to an aim but recalled it, and, shaking his fist toward the retreating animal, he yelled out, "So that's your game, is it, you old she cat, now that I'm fixed for you; I'd give you a dose yet if I hadn't promised you that I wouldn't."

The other fellow told the last part of the story, and then Andy had to give the beginning. Andy has since become rich on cattle. W. N. B.

Denver, Jan. 6, 1884.

101.

One of the most interesting essays I ever read was Max Müller's "Migration of a Fable," in which he relates how different versions of the story of the Milkmaid (who, indulging in [illegible]ful dog dream, spilled her milk) has been told in all co[illegible]nd in all languages. A bit of my own experience may enter[illegible]ou as illustrating how in every clime we sportsmen play the same old tricks on ourselves. One moonlight evening last year, I found myself among a number of marshes and small ponds near the sea shore, on a small island in the Pacific. It was about 10 o'clock. I had visited every pond in the neighborhood, and had succeeded in getting only one shot so far; but I did not like the idea of going home with only one duck, so I went back to a pond I had visited about three hours before. The pond was surrounded by a low bank, covered in some places with bushes. I crept up and looked over; and to my great delight saw two ducks. They kept so still that I thought they must either be asleep or dead; but anyhow I raised my gun to my shoulder and fired. "Confound you," yelled a voice the other side of the pond, "what are you shooting my decoys for?" I saw that I had been fooled and felt so mad that I gave the only duck I had shot to the owner of the decoys and made tracks for home.

Fact.

Honolulu, Sandwich Islands.

THE CRITICS' CORNER.

Editor Forest and Stream;

I have been looking over the "Flickerings" with great amusement at the many pleasant tales told therein. To me it seems that in the phrase of nowadays, "Shadow" must "take the cake," but while he takes that, let me take him to task for his ruthless murder of the New English, the dialect of Yankee land. Being a Yankee of the sixth generation of Yankees born to the manners, customs and speech thereof, I can say that I never heard a native of any corner, border, or middle of New England call a raccoon a "keun," and am sure that "Shadow" never heard such a barbarous twist of the name of that animal from any but a stage Yankee. We talk of "kyows" naow and then, perhaps tew often, but never of keuns. No; rather than rob the robber of our cornfields of one o, we would rather give him more than he owes us, and roll him out two or three extra o's, calling him a coooon. Neither did "Shadow" ever hear a genuine Yankee talk of our canine friends, except in fun, as "dorgs" or "purps." To the Yankeest Yankee that ever whittled stick or chawed gum, they are dawgs and pawps, or may be in severe cases paw-ups. Make all the fun you please of our dialect, but give it as it is spoken, dear "Shadow," and may you never be less nor more infrequent in the "Camp-Fire Flickerings," is the wish of your friend,

Adironda, Dec. 28, 1883. Maj. J. Verity, U. S. H. M.

["Shadow" explains that "kewn" is better than "keun." "Kewn," he insists, is good Yankee in the "parts" where he "was raised."—Ed.]

Editor Forest and Stream:

I am fond of a good story, and like to read one, but it always annoys me to have the point of a story shown me. I want to be let alone and laugh when I get ready. For example, when I read over the "Camp-Fire Flickerings" and got my pencil ready to mark my ten, I found it rather hard to discriminate and mark the best. If you will look them over, you will find that in many, after the rub is given, and when the reader should have been allowed to laugh, he is compelled to read three or four lines descriptive of how much somebody else laughed or swore, or took his hat and left, or threw something at some one. The result is, like an interrupted sneeze—the good of it is all gone when it comes. I beg of your correspondents when they have told their story, then stop, let the reader laugh if he sees the point, if he does not let him sit in silence. J. A. H.

Jefferson, O.

Editor Forest and Stream:

Your remarks on "Angling Slang" in this week's number of your paper are worthy of extension to other departments of sport. No sportsman should rank as a gentleman in the full meaning of the word until he ceases to use the phrases that partake of vulgarity. There are, however, many expressions used in the language of sportsmen that do not exactly come under the classification of slang phrases, but that are very objectionable to those that desire correct and refined speech. I have sometimes thought to make a list of words and phrases that sportsmen should avoid. Such a list might include the following: At the head of the list and the most to be avoided of all is the phrase "speckled beauties" or "spotted beauties" for trout.

Then next I would place those expressions that give the name of the maker of a sportsman's weapon for the weapon itself. For instance: "My Parker" for my gun; "my Leonard" for my rod; "my split bamboo" for my rod, and all that genus.

The author of the "Bread Winners" speaks in his book of the heroine throwing away his "Reina Victoria." This style of setting forth the fine quality of one's guns or cigars is unpardonable.

I recommend that you make up a list of such phrases and keep it at the head of your columns as a warning, and means of instruction.

Lindley Murray.

New York.

Editor Forest and Stream:

Your "Angling Slang" in the issue before me fills a "long felt want," so far as I am concerned. I don't think I ever wrote "speckled beauties" before this moment, for I have always hated that and kindred words and especially the slang of the fraternity. I did write in my paper "speckled trout," hesitatingly, but the Indians never say anything else. What I want to suggest is, give the hunters a stirring up, especially those fellows who "pump lead." That is abominable and for mercy's sake do suppress it. D. D. Banta.

Indiana.

[Next!—Ed.]

Editor Forest and Stream:

Why do you not have an *Index Expurgatorius?* It is a good deal of an institution in its way. As you know, the *Evening Post* has one or at least did have it in William Cullen Bryant's time, and I make no question it was a benefit to the editors, reporters and readers of the *Post*. There are about eighty words and expressions now in some what common use among sportsmen, which ought to be dispensed with. The phrase by whose "damnable iteration" I am most wearied is "true sportsman." Why not "sportsman?" What does "true" mean? We need simplicity in speech and writing. Expurgate the superfluities. Senex Septimus.

THE WOOING O'T.

A LAWYER once, unlike most of his class
A modest man, fell dead in love. A lass
He worshiped quite, but still his secret kept
Till up the scale his cautious courage crept,
And, well assured no one his purpose knew,
He started out with this sole aim in view—
To wit, to woo.

His way led through a wood, the shadows fell,
His waning courage shadowy grew as well,
Until he asked himself, disheartened quite,
"Why am I here at this time of the night?"
An answer from a treetop loud and clear,
In legal language couched, fell on his ear—
"To wit! to woo!"

He fled in fear, although he no one saw;
For fear, like many a lawyer, knows no law.
The bird of wisdom perching overhead
Slow flapped his wings, winked warily, and said:
"Why should this be? Such haste I never knew;
He sure an unwise purpose had in view—
To wit! to woo!"

ENVOY.

Take well to heart this text drawn from the wood:
Your modest wooer never comes to good.
Though all the world your secret clearly knows,
And through unheard-of shades your pathway goes,
Let not your courage fail whate'er you do;
Your wit keep always clearest when you woo.

—*William Howard Carpenter, in the Century.*

Game Bag and Gun.

ONLY A BRACE.

ONLY a brace, but as I strayed homeward in the late afternoon of that glorious October day, with the mottled beauties sleeping side by side in the net work of my game bag, I was happy, supremely happy. I had been out since morning, tramping across the crisp stubble and along the edges of the likeliest grouse covers. My dog, a small field spaniel, was now content to trot soberly at my heels, tired with his long day's work. He had done splendidly, and I could not forbear every now and then stooping to put his head and speak a word of well-earned praise. We had found the birds scarce—very scarce—and yet a jolly day we had had, Cruso and I. We felt as though we had made the best of our opportunities, and if the bag had been ten times as heavy it couldn't have given us more pleasure than we had in securing that handsome brace, that filled the netting so nicely.

We had seen—let me see—five birds; seen, mind you, not shot at; two of them were quite out of range. The first was in a little narrow swale, that lay in half-moon shape, in the center of a field between two larger pieces of cover. The swale was thickly grown with young poplars and blackberry bushes, and I knew in my bones, as I drew near, that there must be a grouse lurking there. Steady, Cruso! There, now you may go. Hide cock! I raised the hammers of my gun, and stood near the inner curve of the swale, alert, with nerves a-tingle, while my spaniel worked the cover. I could hear his feet pattering in the leaves. He passed me, then suddenly caught scent. Through a little opening I could see him nosing the cool ground, his tail vibrating at a furious rate. Now—now be ready! *Quit, quit, quit*—whirr! The noble grouse rose within six rods of where I stood, and dashed out of the cover at whirlwind speed, bound for the patch of woods to the east. Bang! a miss, by all that's execrable! Bang! She swerved a little, but it was too far away for that second shot to take effect, I guess. Wonder if I hit her at all? Steady, Cruso—down! It was too bad, old fellow, wasn't it? But you must remember I haven't got my hand in yet. It's been more than six months since I drew trigger on the hurtling grouse. There, now; we'll cross over and see if we can't put up that bird again. Steady!

I dropped a couple of shells into my gun, and Cruso and I hastened across the field to the opposite cover. Now, old boy, be sure you work around her and drive her this way. Cruso's eye sparkled with a gleam of intelligence and away he went. I have never seen but one dog who knew how to literally circumvent a grouse, and that dog is Cruso. He will do it three times out of four, and drive it out just where you want it. This time he ran for about twenty rods down the edge of the cover and then plunged in. I knew he would work back my way and stood in readiness. He had not been in the cover a minute when I heard the palpitating whirr of wings—coming, sure as you live—coming right toward me. See! a gray gleam among the leaves, and in another instant the bird breaks cover close to me. I can see the frightened and yet saucy gleam of its eye, and the ruff of feathers angrily raised around the neck. Oh, my pretty lady, you are vexed at our persistent attentions, aren't you? Now to retrieve our fortune. Steady, nerves! steady, eye! The brown barrels spring to a level with the shoulder; a quick glance along the rib, with both eyes fastened on the pert head of the rapidly flying bird. Now is the auspicious moment. Intuition flashes along the nerves and gives the electric signal. Bang! The bird turns in air, hurtles down upon the stubble and bounds twice from the ground with the strong momentum of its flight. A little cloud of feathers floats behind to mark where the fatal shot took effect. Cruso comes leaping out of the cover, his long ears flying about his head and his eyes shining with excitement. Yes, old fellow, you shall taste feathers. Dead bird—fetch. Isn't that a pretty picture, now? The little brown spaniel, with his head raised in air, stepping so daintily and proudly with the glorious grouse dangling from his mouth. I would give something to have a magic frame about that picture which would keep it so forever. Drop, Cruso! that was nicely done. There, now, steady! The bird is bagged and we will turn our attention to the pleasure in store.

Nor more birds in the larger cover. It's a fine place, but they have been scattered by boys, and we will have to keep on to fresh fields and pastures new.

We crossed the old abandoned railroad track, and skirted a thick pine and hemlock cover for some distance; but, although the spaniel worked every rod of ground, we did not find a bird. It was too early for them to have sought the thick woods. Further on lay a sort of tamarack and alder swamp—a capital place in times past—and calling the dog to heel, I made my way to it across the fields. It was now approaching high noon, and as I knew of a nice cool brook near the other edge of the swamp, I determined to work around first on the lower side of the cover, and then stop for lunch when I reached the brook. When out with my spaniel I make it a point never to enter a cover unless I am obliged to, as the dog is trained to work the brush for me and bring the birds within shot. This I believe to be the only proper and legitimate way of using spaniels for grouse. They should be used as flushers, never as treers.

I had hardly reached the edge of the cover when Cruso scented game. I stood in readiness to shoot, expecting every moment to see a grouse swiftly dashing over the alders, and so intent was I listening for the whirr of the rapid wings, that I suffered a fine plump woodcock to get up and twitter out of sight in the deep thicket without pulling on him. Just as he disappeared I recovered from my surprise sufficiently to fire, but as Cruso did not make game where I saw him last, I concluded that I had missed, and called the dog to heel. A few rods further on I sent him into the cover again and waited. Whirr—whirr—whirr-r-r. I declare! a whole flock of young birds—four of them. Not a very large flock, to be sure, but fully as large as are the majority of them, a month after the opening of the season, in this vicinity. Two of them were within easy range; the other two flew deeper into the swamp. Why didn't I shoot? inquired Cruso, as plainly as eyes could speak, as he came dashing out in the wake of the two birds he had driven toward me, and mounted the low fence to see where they had gone to. Yes, why didn't I shoot, old boy?—that's the question. Guess it was because you surprised me so by driving two birds at once out of that cover, a thing that doesn't happen very often in this part of the country. However, we'll look them up; come along.

But it was more of a job to find those birds than I had expected. I saw them dive back into the swamp, and sent the dog in near the place where I thought they must be lying, but no grouse could be found. Then I ventured in myself and looked the ground over carefully, but they were still missing. Finally I came to the conclusion that they must have joined their companions in the deeper part of the swamp, where there was a thick clump of young evergreens, and in some of these young trees I was confident they must be hiding. I resolved to keep on to the brook, eat my luncheon, take a little rest, and then look for them again. Perhaps they would be back on the ground by that time.

After lunch I went into the heart of the swamp and looked around for a long while—nearly two hours—but not a bird could I find. This was discouraging, besides being a kind of work to which I was not used, and did not like. So I called Cruso out, and we took another rest by the brook. The sun was beginning to slide down the last curving slope of blue sky, and my watch informed me that it was high time to start for home. Still, I was unwilling to go without at least one more sight at those modest and retiring birds.

I went back to the edge of the swamp where I had first started them, and sent the dog in. Ha! he has one of the recreants up! See! It dips down in that little clump of pines in the very neck of the swamp, just out of range. I called the dog to heel, and slowly crept into the swamp. There was a little open space between me and the clump of pines, and when I reached this I stood still, and gave the word to Cruso. He understoood me, and, making a wide detour, entered the cover from the opposite side. There was a suppressed bark of excitement, a whirring of wings, and the grouse came sailing out into the open space. When she saw me she made a quick turn to the right, but I caught her flight in a moment, and holding well on, pulled trigger. The smoke hid the bird from me, but immediately afterward I heard a thump in the grass, and then the rapid throbbing of wings which announces a fatal shot. Cruso comes bounding through the grass, and claims his usual privilege of retrieving the warm bird. Thanks, old fellow! I should never have got her if it hadn't been for your help. Now we will consider our day's sport finished, and start for home. The bag is not heavy, but it is worth its weight in gold. We have earned what we have fairly, and that, after all, is the sum of a true sportsman's delight. PAUL PASTNOR.

WITH THE DUCKS ON DELTA BAR.

TAKING the ducking season through, it is doubtful if there is a place anywhere that the sportsman is more uniformly and generously rewarded than right here in the harbor of Vicksburg. Since 1876, when the river cut through the tongue of Louisiana that projected, a narrow peninsula, in front of the city and away to the north of it, the lake left by this action has been gradually filling up with mud till, immediately in front of the former landing, in the dry season, there is no water whatever, and pedestrians can cross the original bed of the river on foot dry shod. Just at the foot of the little island left by this cut off the willows, in some places, have already grown to the height of twenty feet, and it will be but a short time before the entire old channel, next to the city, will be simply an almost impenetrable willow thicket. During the past summer quite a sum of money was expended by authority of the Government in dredging with a view to opening up a canal from the city front to a point where the main river now strikes the shore, a distance of about a mile. It was found some time after the work had been in progress that the sediment which had been deposited to the depth of over eighty feet in less than seven years, was not much thicker, if any, than molasses in winter time, and that it ran in and assumed a level as fast as the dredging machine took it out. So this experiment was discontinued.

In the upper mouth of the lake the deposit has not been so great, so that even when the lower mouth is dry the larger boats can still enter the lake and steam around to the old city landing. In the fall, however, the river is generally so low that no boats come in at all, the wharfboat having been moored at the new landing below. Within the last four years the point on the Louisiana shore has been sheathed with mattrasses, which have stopped the caving, and thus prevented the current on the Mississippi side striking the shore further from the city. All around the lake are bars and mud flats and coves running up into the willows, and during the season of low water, in summer, these become covered with a rank grass, prolific in seed, which seems to tickle the palate of the ducks, and especially the gamy little teal. Ordinarily about the time the ducks begin to come down from the North the river begins to rise and the water to cover these grass plats and to float the seeds that, in some places, nearly cover the ground. The ducks at once flock to those localities in great numbers and furnish excellent sport to the hunter. My brother and I, who have been shooting here in the harbor for the last five years, have made it a rule to keep an accurate record of the stages of water when it reaches the various places mentioned, and by that means, by keeping our eyes on the gauge, we can always know when to pull out for any particular point with our decoys and other paraphernalia. The ducks seem to learn when and where to go for food by intuition, for almost the very moment the water pushes upon a new territory covered by grass seeds, they put in an appearance at that point, although but a short while before not a single one could be seen in that vicinity. It is a knowledge of these facts, and by acting upon it, that have brought to my brother and myself what our friends here are pleased to term good luck. Our scores this winter have been exceptionally fine.

During the holidays and for the first ten days in January, the ducks were unusually abundant just in front of the city and within rifle shot of the elevator at the landing. They were mostly teal, with an occasional sprigtail and, at rare intervals, a mallard. One day my nephew and I picked up a pair of canvas-backs. It was a common thing for a couple of fair shots to bag from 40 to 50 ducks in half a day. On the day after Christmas this nephew and I bagged 75 by 11 o'clock. The next afternoon Mr. E. H. Raworth and I picked up 65 from the same blind. Other parties did nearly as well. This constant hammering did not seem to drive the ducks away. When a volley was fired at them they would whisk briskly away to dab down among or sail in the vicinity of another batch of decoys. But finally the river rose, pushed out into the fields and the swamps, covering new and prolific territory, and the disturbed fowls hied themselves thither and for a time at least were comparatively secure. But then came the severe cold wave early in the month, and freezing up the ponds and lakes and all still water inland, drove the ducks to open water, and sent millions further south. This state of affairs lasted so long that the larger ducks especially found it a difficult matter to secure their accustomed food. They evidently became demoralized, for they alighted in the oddest of places, in open and barren fields, on the public highways, along the most insignificant branches and on the ground in the woods. Of course, during this period, they became an easy prey to the most clumsy darky with his old muzzleloader, and the market was glutted with them and the price of them nearly reached zero. When, however, the weather moderated, the thaw came and the ice disappeared, the river having kept on rising, the ducks sought the heart of the swamps to quack and quack and stuff themselves with acorns to their heart's content without much danger of molestation.

On the 8th day of January, one of the coldest of the season, when a stiff wind blew from the north and the earth was hard frozen, and the trees were groaning from their solid coating of ice resulting from the big sleet of the day before, my brother "bonced" me to go a-ducking with him down on Delta Bar. This bar is the point of Louisiana southwest of the city, and to reach it one has to row out of the lake and then across the broad, swift current of the river. Then to reach the ducking ground at the stage of the river then existing it was necessary to row down around the bar to the old main shore and pull up through the switch willows back toward the city, where open water could be found near taller willows in which to run the skiff as a partial blind. The entire distance is something over five miles. When the proposition was made to me to take a hunt under such circumstances, I declined it in a very peremptory manner, whereupon I was twitted with being a "parlor hunter," and had fun poked at me because, being a Nebraska man, I could not brave a Mississippi day. My brother, after hunting among our sportsmen for some one to accompany him, and finding all of them of my way of thinking, declared he would go alone. I had never let him do this and would not let him do it on this occasion.

So we came out home and put on our hunting gear. As we walked down the street on our way to the fish dock, where we keep our skiff, the decoys and other things, the few people whom we met stared at us as though we were a pair of escaped lunatics. The idea that two sane men would venture out in such cold and stormy weather for sport seemed to stagger them. But for all that we got to the dock, cleaned the ice out the skiff, thawed out the row-locks with hot water, loaded up and struck out about noon, the only difficulty we had being at the start in keeping our hands warm. Later we did not even experience this trouble.

As we passed down around the edge of the bar, where the water had reached the little willows, we frightened up great flocks of ducks, and we could see them in the air all over the territory just being submerged. When we came to the lower end of the bar and started up toward the upper part of it we discovered that it was entirely covered by mush ice, through which it was very difficult to propel our skiff. So stiff and unyielding was this ice that as the willows were bent aside by the passing boat they remained in that position to plainly mark our path. About half a mile from the open river we came upon an open spot, a sort of nook surrounded by larger willows. Here we put out our four dozen mallard and teal decoys, by setting them in the slush ice. It was a very tedious and laborious task to turn or move the skiff about, and we avoided doing this as much as possible by setting a decoy on the blade of a long oar and then placing it as far from us as we could reach. In this way we were enabled to make a pretty fair display without much moving of the skiff.

After the decoys were all placed we worked the skiff a few yards into a point of willows near by, which was a hard and disagreeable job. The ice had to be broken wherever we moved, and the willows being coated thickly with sleet from bottom to top were not a pleasant thing to tackle. We were poorly concealed if, indeed, it could be said we were concealed at all, and the willows, standing between us and the decoys, made the shooting quite difficult and uncertain. But for all that the ducks decoyed reasonably well; for we soon had some twenty or thirty lying about on the ice. Then they began to flare up out of range as they came in. On viewing the field we came to the conclusion that the dead ducks lying on their backs and the many bloody pools where their carcasses lay, frightened the others and kept them from coming within range. So we determined to go out and retrieve those we had already killed. This proved hard work, and we broke one oar working our way through the ice. While we were out some hunters got up clouds of ducks around the outside of the bar, all of which were lost to us, of course, as our exposed position prevented their coming near us. There were some of our ducks that had fallen on ice too thick for us to work through, and others so far away that we did not think it would pay to go after them. So after picking up between twenty and thirty, we went back into the willows, having been out about an hour.

This time we shot till the stars came out. It had been very cold all the afternoon, and we became aware that as the day advanced it was growing colder still, and at the eleventh hour we began to fear we might be frozen in so tightly as not to be able to get out to open water at all. We found on leaving our position and going out that the ice had become much more compact and that even where the skiff had made its way when we first retrieved it had frozen tight again and had to be broken as before. We succeeded in picking up all the decoys and the larger number of dead ducks, after working till the perspiration ran down our faces, when we started to work our way to the river. My brother sat at the oars while I kneeled on the bow of the boat and broke a road in front of us.

At the end of an hour, just as we were nearing the end of our labors in the ice, I broke another oar smack in two, and my brother split nearly half the blade off one of his, thus leaving us with but one oar and a piece with which to make our long journey home. But after getting through the willows and into the open river we did not find the breaking of these oars as great a calamity as we at first imagined. I used the sound oar on one side at the forward rowlock, and my brother, who is much the stronger man, used the crippled one on the other side aft. In this way we worked our way around the bar, then up the bar toward the Delta light, so as to be well up the river before attempting a crossing, then across the main channel and finally up the lake to the elevator, where our fish dock was moored.

It was after 9 o'clock and we were nearly exhausted. My coat, upon which I had kneeled while breaking ice, and which had gotten very wet from the splashing, was frozen so stiff it had to be thawed out before I could put it on. Everything else was coated with ice, though we were as warm as a day in midsummer. Our ducks counted out sixty-four, all teal, except a few old shovelers and one or two sprigs. These were left at the dock to be sent for next morning, and we trudged out home in as light gear as possible, reaching there a few moments before 10 o'clock to find the folks had begun to grow very uneasy about us. On look-

ing at the thermometer we found the temperature to be fifteen degrees below the freezing point. For once I gave my gun the promise of attention on the morrow, and roiled in bed as soon as practicable, about as weary a man as you ever saw or heard of.

My brother and I think we left between ten and fifteen dead ducks lying on the ice which were not included in our count. And there was an "if" in the case, in the bargain. If we could have made a reasonably good blind, I think it would have been an easy matter to have bagged at least one hundred ducks. BURR H. POLK.

VICKSBURG, Miss., Jan. 23.

SOUTHERN SHOOTING GROUNDS.

Editor Forest and Stream:

When I left Washington, my object was to take a route that is comparatively new, and which promised more interesting details and inducements to sportsmen and tourists than any old line that was familiar to me. Hence, after leaving Warm Springs, I took a route to this place that proved a source of remarkably pleasing interest and delight, and I think very inviting to those who come with dog and gun.

As there are numerous well-known game fields on the line, and a vast variety in the character of the grounds, I will give those who are interested some of the details. Taking Knoxville, Tenn., as the initial point, perhaps the first best thing to do is to visit the superintendent's office of the E. T. V. & Geo. R. R., and get all the information you desire and permission to stop off by your ticket at any place or places that may be decided on as inviting shooting grounds. This gentleman, Jas. F. O'Brien, General Superintendent, has a very warm heart toward hunters, and a splendid appetite for game, and that argues that his subordinates will treat men, guns and dogs in a royally proper manner. If you wish to remain a few days in that charming and singularly interesting city, you will find a very spirited and eager set of young sportsmen, who are thoroughbred gentlemen and remarkably hospitable. The fields within easy reach are found very attractive and of every character that sportsmen may want to test. There are hills and dales, dry fields with clean, closely laid grasses, and just enough grain lying about the roots to seduce birds from covert places in the brier-filled or sedge-laden corners of worm fences. So that when birds are started, they furnish the prettiest and clearest shooting one may desire, and let me tell the oldest and best among you who shoot, it will require sharp eyes and the quickest of touch to drop your birds anywhere in those well farmed fields in the grand and lovely regions of the Clinch and Holstein rivers in East Tennessee.

In the hillside coverts and brier patches, with innumerable rills and springs and streams babbling along their stone-tuned courses, black haw and other delicious berries induce birds to harbor and linger until their flesh acquires a delicacy that is delicious as were the golden grain fed ortolans that made the feasts of Lucullus the standard of all gustatory comparisons in all ages since that luxurious period. On the mountain sides there are pheasants, the rich flavor and rare excellence of which will repay one for the labor and skill required to bag them. They are in elegant condition from feeding on wild berries and farm grains, all of which gives their flesh a most delicate flavor. The skill required to bring this kind of game to earth is one of the best tests that a sportsman can wish for. In the edges of thickets that lie along fields with numerous clumps of grass and brown caps of low bushes the wary birds often lie close, until the hunter and dog come within a few feet. Then with a sudden flutter, that takes away the head often of the coolest and steadiest of shooters, the brown mass goes straight through the leafless branches, and with a laughing whirr asks the man with the gun to answer its call of defiance. To shoot one of them under such demoralizing and tantalizing circumstances is a feat that entitles the successful sportsman to all of the credit he can proudly demand.

In the fields dogs find splendid and fine coursing, and retrievers have easy work. But in the heath and thickets on wild mountain sides, the brambles, laurel, rhododendrons, rugged footing and rough surface generally, present many formidable obstacles to finely bred, thin-skinned and delicate dogs. The well-trained animals that abound in that section, and are familiarly seen in nearly every farmyard throughout East Tennessee, are equal to an immense amount of work, and seem to be as hardy and enduring as are the mountain ponies that never die in that section. The sinewy legs and powerful arms of those mountain-bred dogs make an excellent sort of graft on good blood of other sorts.

If you wish to try your barrels over a stretch of water at those butter-balls which are found at every turn and in every eddy of the river, you can have as much fun and work as can be wished for. There is no need of decoys in any of the duck-laden harbors of the Pigeon, Holstein or Tennessee rivers. Even the innumerable army of sable pot-hunters who shoot with miniature mountain howitzers, and fish for them with nets and traps, are unable to lessen the supply to an appreciable extent. Bluewing teal, black and butterballs are in abundance, and will continue to offer inviting inducements to shooters for a month or two.

Leaving Knoxville you take an E. T. V. & G. R. R. ticket for Jacksonville, Fla., with stop-over privileges. Then you can drop off at any point that you fancy, and it does not matter at what place you want to try gun and dog, you will find a good field for sport. In every community or village or station along the entire line there is one or more persons who have a fancy for shooting, and hence you will find splendidly trained dogs everywhere, and the best of breech-loaders, as well as men who know how to use them effectively and successfully. Such persons, too, are remarkably hospitable wherever you find them in all sections of the South, and the only letter of introduction or passport necessary to make them kind and welcome you is an expression of that kinship that makes sportsmen fond of such fellowship the world over. I have met with it in the Mississippi swamps, foreign jungles, the swamps around New Orleans, and marshes of New Jersey, the fastnesses of the Rockies and grain fields of Pennsylvania and Ohio, and the prairies of the West, in the log cabins and palaces of the South, and the reserves of Europe. And I find that the polished gun barrel and password of shells and charges opens the warmest hearts of the fraternity of shooters and hunters everywhere throughout the world.

At Dalton, Georgia, there are some charming fellows with dog and gun. In Rome and vicinity, some more Nimrods of most excellent character and name are always ready to take a day in the fields. Along the line to Atlanta, the fields are new and very inviting, as they have not been investigated much by any one except local shots and amateurs. All of these, however, are well to do planters and merchants, who believe that it is a very gentlemanly sport and occupation to take exercise with gun and shoot over an intelligent dog in the fields.

In Atlanta and any of the towns and stations in the vicinity, there are sportsmen who keep in the advance of all the pretty and good things connected with life afield. With these, any one who has a mind that way, will find a vast deal of enjoyment and as much sport as can possibly be attended to, as birds are plentiful and within easy reach by any of the numerous lines that spread out like the radiants from that vast spider-looking town called the Gate City.

From there to Macon the trains glide over a track that makes one feel as if he was making the transit on a greased streak of lightning. I am told, too, that in the barrens and plantations there are vast numbers of those small and hard to shoot quail that abound in this region. In dear, old Macon, where live the loveliest, most charming and dearest people if has ever been my fate to know, there are men who know how to shoot, guns that are worth a fortune, and dogs that are far better bred and more intelligent than some college students with whom we have come in contact within the past fortnight.

With these Maconians you will find as much pleasure and game in a day as can be gathered in a month elsewhere. There is a delicious hospitality and charm of entertainment native to this class of men, and all that is necessary is for one of them to vouch for you to receive attention and courtesy such as pertains to a royal visitor.

From Macon to Jessup, and thence via Way Cross to Jacksonville, there are many haunts where birds, turkey, deer, bear, ducks, foxes, wolves, fish and all kinds of game are found in abundance, and one cannot go amiss by stopping anywhere for a day's sport. DR. I. E. NAGLE.

FLORIDA HOUSE, St. Augustine, Fla.

A VISIT TO CHATHAM COUNTY.

ACCOMPANIED by my friends, Teceel, Duffrey, Mud and LeG., it was my good fortune to have visited that part of Chatham county, called the Hickory Mountain during the early part of the month of December. With our dogs Nip, Bob, Pelham and Argo, and an ample supply of loaded shells, we took the train at midnight on Monday, the 10th, for Hamlet, a railroad junction six miles southeast of our town. At that point we got on the cars of the Raleigh and Augusta Air Line road, and at 6 the following morning were cosily sitting around a good fire in the reception room of Page's Hotel at Sandford. At this place the Yudkin Valley Railroad, which, at present, is finished to within twenty miles of Greensboro, crosses the Raleigh and Augusta Air Line, and up this road to a place known as Matthews's in the western part of Chatham, it was our purpose to go, and thence by road-wagon to our stopping place, a distance across the country of eight miles. But the schedule did not suit. If we waited at Sandford for the train we would have been obliged to remain there all day

Not being disposed to do this, we made arrangements with Mr. Page, the hotel keeper, to place our luggage on the cars, and we took the track, intending to hunt the old McIver plantation and board the train at Egypt, seven miles off, when it should arrive, and go on it to Ore Hill, the terminal point to which the mails are carried. We had been told that we would find plenty of game in the plantation mentioned, as well as in the fields on Deep River, lying in the vicinity of Egypt. After a fatiguing tramp of about four miles on the cross ties, rendered more fatiguing from the fact that we had had no sleep during the preceding night, Teceel with his setter Nip, and I with a little pointer named Argo—not after celebrated vessel "which took the fleece to the Thessalian city"—went on the right side of the track, while Jim LeG. with Pelham, and Mud as a supernumerary—for Mud has no dog, and does not want one, so long as any one else will allow him the use of his—took the left. Duffrey with his dog Bob had left us a half mile back, and was doing his best to fill his bag before the others commenced hunting. To our great disappointment we found but few birds, and when we reached Egypt at 1 o'clock we had not more than a dozen. Teceel and I concluded to walk on, and crossing the railroad bridge, determined that we would hunt up the river to the Gulf. The other party we left shooting south of Egypt. The distance between these two stations is but three miles by rail, but by the course of the river it is not less than six.

We found but few birds, and the most of these availed themselves of the proximity of the river to seek a covert into which we could not follow. When we got near the Gulf we heard the others shooting, they having taken the line of the railroad. Upon counting up the spoils, we had killed but thirty-three birds. After a hearty supper, upon chicken, sausages, etc., we patiently awaited the arrival of the train. It came, with our baggage on board, about 8 o'clock, and in less than an hour we were at Ore Hill. There is at present no hotel here, and all of our party except your correspondent had to sleep in the coach. Owing to his age, as it was said, he was kindly invited by Capt. Roger P. Atkinson, civil engineer, in charge of the work of construction, to share what was really a luxurious couch in an old building, once used in connection with some iron works at this place. Next morning he gave us all a substantial breakfast, and placing our luggage, dogs and selves on the construction train we were off for Matthews. Arriving, we were put off in a field, and the train departed for the scene of tracklaying. It was not long before we saw Jo Duffrey's wagon, driven by his kind-hearted and pleasant son Tommy, driving up. Some of our party had in the meantime got up two coveys of Bob White within fifty yards of the track, and managed to get about a half dozen of them. I got but one shot, which had no other effect than to knock off the feathers.

Putting our effects upon the wagon we started off to our place of destination. On the way a fine covey was flushed, and pursuing it, Teceel got five, Mud two and Wells one—his only shot. Another was started on the route, and we got three or four of them. When near Duffrey's, Jim LeG., not having the fear of the law—and he is a lawyer—trespassed upon forbidden territory, and killed two birds. In a short while we were at the house of our host, who gave us a kindly welcome—it was kindly upon the part of the wife and children, for they are an excellent family—shown to our quarters, and bidden to make ourselves "at home." Soon we heard the welcome announcement that dinner was ready, and to a table laden with substantial viands, and presided over by a genial hostess, we went, and all gave ample testimony that the food suited our tastes. Mud, in particular, showed his ample capacity to make a generous landlady's heart rejoice, and thus, if for no other reason, ingratiated himself into the good graces of that very important personage—a position which he held during our entire stay under the hospitable roof. Indeed, he rarely fails to render himself agreeable to the fair sex; and despite all his blunders, his follies and his peculiarities, possesses always the sympathy of matron and maiden.

In the afternoon we took a little jaunt into the fields, which had been hunted over by other parties, and were not entirely unsuccessful. At night all were tired and sleepy, and "bed time" came at an early hour. With me, on a hunt, it always comes early, and as a general thing I seek the downy pillow while the others sit up and talk, often regaling them, as they tell me, with sounds which do not remind them, except by contrast, of the sweet cadences of the mocking bird, "the lascivious pleasing of a lute," or the melodies of Miss ——; well, I have forgotten her name, but she sings "Baby Mine" and the "Maid of Dundee" to perfection. Candor compels me to say that, if human testimony can be believed, I have the unfortunate habit of snoring. The evidence of one who ought to know, because of abundant opportunities, I cannot gainsay. Besides this, I have heard it myself. When bed room is ample, this practice of mine deprives me of a bedfellow and a room-mate, but when it is not, my companions usually assign Mud to me, because of his philosophic good nature and his incapacity to distinguish sound. On this occasion, however, the sad lot fell to Jim LeG., who let no occasion pass in which he did not complain that I disturbed his repose. I am sorry that I so trouble my friends, but I cannot help it. That is all.

Next morning, after slumber, which the preceding two days' labor had made inexpressibly sweet, and a capital breakfast, to which ample justice was done, we got ready for our pleasant recreation.

Teceel and Jim, with Nip and Pelham, were to take the fields on both sides of the Pittsboro road, Mud and I, with Argo, were to go down a little creek, while Duffrey and his brother Jo, with Bob, went to some fields lying to the north. It may be as well that I say, Teceel shot a 16 bore 28-inch Scott, Jim LeG. a 12-bore Webley, Mud a 16 Scott, I a 16 Tolly, Duffrey a 14 Scott, and Jo D. a 16 Webley. When night came, and the weary sportsmen counted the trophies of the day, Teceel had 31, Jim LeG. 26, Wells 18, Mud 17, Duffrey 13, and Jo D. 3. The two last had combined business with pleasure and did not hunt assiduously. Besides, Jo is not a sportsman. Mud and I did some good shooting, and some that was no good. If I had bagged all the birds I shot down and wounded, and ought to have killed, I should have had over thirty, and so would Mud. But 108 birds in one day ought to satisfy reasonable men. We had more than enough for ourselves, and gave some to neighboring farmers, as we passed along.

I know I will be excused if I suggest that sportsmen can easily avoid some of the troubles to which they are sometimes subjected, by the use of a courtesy which costs but little and is always gratifying to landed proprietors. Whenever it is practicable, the gunner should always ask the consent of the owner to hunt over his premises. He should not shoot near the dwelling, nor when there is danger of frightening horses. If he meets the proprietor he should show his good breeding and good sense by speaking to him and engaging in a little friendly conversation, as well as tendering a part of the contents of his bag. Even if he does not know who the landlord is, he should give every man whom he meets a decent salutation. In the country every man expects it, and it is the universal custom. Gentlemen from the cities should always recollect that. In densely populated towns it is not practiced and is not expected. But city habits must be left off when men go to "the rural districts" and want sport upon the lands of others. Let them observe what I have said and they will not be the losers. But if an upstart, who has on a solar hat, a corduroy suit, leggings, hunting shoes, a gun and a dog, goes into the country, "treads down the grass and herbage" of another, passes him unnoticed, shoots around his house, his 10-bore gun, with five drams of powder, pockets and carries off all the game which he may chance to kill, without as much as a nod of recognition to the owner in fee of the lands or the tenant in possession, he is sure to be an unwelcome visitor, if he is not peremptorily ordered off the premises. Such fellows as these do much harm to gentlemen who observe the proprieties and decencies of life.

I do not mean to trespass so largely upon the columns of the FOREST AND STREAM or the patience of those who may honor me by a perusal of my effusions, as to give the incidents and results of each day's tramping. We got in about three whole days of hunting, and the game totalized something over 300 birds, besides an occasional "molly cotton tail," whose flight offered too great a temptation to Mud and Jim, who rarely let one pass without a salute, notwithstanding the bad effect it has upon the dogs. Our trip was an agreeable one, entirely free from accident. The heartfelt kindness of our host and hostess, and their children, all of whom strove to make our stay pleasant, added much to our enjoyment; and when we left the farewell was as cordial and unaffected as was the invitation to come again and partake of their hospitalities. We got safely back to our own friends, found all well and glad to see us, and even full of thankfulness, I think, for all the blessings and mercies which had been vouchsafed.

Before taking leave of my "gentle readers," I cannot forego the opportunity of saying a few words to such of them as are possessed of ample means to gratify their fondness for health-giving field sports. Among the patrons and lovers of the FOREST AND STREAM are quite a number of gentlemen of easy fortune. These can, without harmfully diminishing their estates, easily provide for an opportunity of much enjoyment for themselves and their chosen few. Along the line of the Yudkin Valley Railroad, and within easy reach of it, there are many tracts of land which can be purchased on reasonable terms. These tracts consist of from two hundred to five hundred acres, and on all of them birds abound. One of them the wealthy sportsman can buy, lease it to a good tenant who will pay a remunerating rent, and this estate would give the owner full access to the lands of the neighboring proprietors, especially if he showed by his intercourse that he was worthy of their confidence. This would be far better and less expensive than the purchase of shooting points at high figures and correspondingly heavy incidental charges, in other localities. He could build a small but neat and comfortable house, for his own occupancy during his visits; the wife of the tenant would prepare his meals, make his beds and air his linen, and a horse and wagon could be had on moderate terms. In addition to all this he could sport on his own land and the

lands of his neighbors, and be able to take himself away from the cares of business, freed from all "rumors of oppression and deceit, successful and unsuccessful war," and when the hunt was over, feel an invigoration in mind and body, which no frequented spot could give.

A Happy New Year to all. WELLS.

Dec. 31, 1883.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

In spite of my resolution to the contrary, I find myself asking once more to be heard upon this subject, since I see that I am not clearly understood by all. With the opinion of Mr. Duane in your last issue, that the question is one of improvement of ammunition rather than of existing arms, I fully accord.

My theory as regards the effect of certain charges upon game has already been incompletely set forth at some length. My desire now is to more fully explain myself with reference to this division of the subject.

My experience, I need not repeat, has demonstrated sufficiently, to me at least, that upon heavy game a light bullet is not effective. Especially if it be hollow-fronted or the lead be soft, the tendency is too great to flatten out and to fly to pieces upon striking game, when a high degree of velocity has been imparted to the bullet. I also have found, theory to the contrary notwithstanding, that "shock" without penetration counts for very little on large game. Consequently, though with a large charge of powder and a light bullet we get one very desirable thing—flat trajectory—we are very apt to lose another and more desirable thing—good penetration and killing power.

But cannot we compromise? For it seems to me that by mutual concession we may still be able to get results which will happily combine the two, and which will give us sufficient penetration with the flattest trajectory possible when using a bullet heavy enough for the former purpose.

Bearing this in mind, cannot some one suggest a charge, a proportion of powder to lead whereby the best possible results shall be obtained? I need hardly add that he will thereby incur the lasting gratitude of all who love and use the "hunting" rifle. As to the chief principle involved in the effect of different charges upon game, it may be said that its best illustration is had when we speak of it as being the converse of that principle by which a tallow candle is driven through a board. Give this a low degree of velocity and it will be found to be mashed and demolished by the resistance of the board.

Give it a high degree of velocity and it is driven cleanly through the board, the resistance having been overcome. Now, the converse of this is our case. (Let me say that it is better demonstrated with a hollow-fronted or very soft bullet than with a hard, solid one.)

Conversely, then, since in this case we are driving the hard substance against the soft one, if we give the bullet a very low degree of velocity it will scarcely penetrate the skin.

Increase the degree of velocity and better and better penetration is had until a limit is reached, which we will call the maximum of penetration with this particular weight and character of bullet. This "limit" may be and in many cases no doubt is more than sufficient for game shooting.

Now, after this point has been passed, additional velocity will continue to give less and less penetration, until theoretically and sometimes almost practically we come back to the point from which we started, no penetration at all.

That is, in my humble unscientific opinion, after this limit has been reached, the skin and flesh offer more and more resistance as the bullet is driven with greater rapidity, which amounts to the same as saying that a bullet impelled with infinite velocity will not penetrate at all since it would meet with an infinite resistance. Flesh would become adamant as opposed to it.

The immense force of the powder remaining after the bullet arrives at its destination is thus reflective in its effect, and is expended upon flattening and mashing up the bullet. So thus it is seen that there is such a thing as too great a charge of powder.

Now we can probably better understand how it is when using light and hollow-pointed bullets (the latter feature of course greatly retarding the bullet in its course through flesh if it holds together, since it causes it to spread and present a greater surface), while we get flat trajectory and certain force, we do not get penetration and killing effect. Of course I do not care in what shape the bullet in its entirety reaches the "other" skin, the more battered and irregular in shape the better. But the prime requisite is that it should never fail to penetrate the vitals, the "hollow," and to break whatever bones it encounters from whatever point it enters.

For example, if I shoot an animal standing quartering away from me, and hit him in the left ham, I want to find that the bullet has broken the right fore shoulder. Let it never fail to go from end to end. Of course, further penetration than that is unnecessary. Get this effect first, and a certain weight of lead is indispensable thereto, then do what you can with regard to flat trajectory. I regard the order of merits of a hunting rifle to be:

First—Safety.

Second—Strength, durability and ease of manipulation.

Third—Sufficient accuracy.

Fourth—Killing power and penetration.

Fifth—Flat trajectory.

Sixth—Portability, to be determined, of course, by the individual strength of him who expects to use it.

Seventh—Freedom from recoil.

Eighth—Finish and ornamentation, which, while it counts for something and gives rise to a pardonable spirit of pride in the possession of the arm, yet detracts somewhat from the pleasure of a rough trip, since so much care is required to keep it bright and in good condition.

Now then, for all deer, sheep, antelope and like smaller game, and even elk, and presumably moose and caribou, 300 grains of lead is quite sufficient, and for game of this kind I would consider the .45-85-295 or preferably the .40-95-300 of Bullard manufacture, referred to by Mr. Farrow, just the thing. I need not say that I am delighted with the introduction of these rifles. But for large bear, and for buffalo, or for game in India, I would desire more lead at the expense of flat trajectory since we cannot have both, and greater killing power and penetration is needed; say about 400 to 500 grains.

A hard bullet of 450 grains, $\frac{1}{7}$ tin, with a very small hole extending one-third or at the most one-half its length, would be, as I at present, without having tested it, suppose, very effective upon such large game.

I quite understand "Bengal Sepoy's" answer to my objection to English express rifles. There is something unquestionably in the hollow-fronted bullet theory. But these are at present made to my mind incorrectly, *i. e.*, the hollow or hole is much too large and too deep; so also do I think that in the anxiety to get flat trajectory, the charge of powder employed is too great and good penetration and killing power are sacrificed in consequence since it acts reflectively, as is above shown, upon the bullet. Thus will be understood my present preference for a solid bullet.

Now could not this Bullard .40-90 repeater use two kinds of ammunition so that we might vary this, as suggested by "C. D.," according to the game we are likely to shoot at or according to the distance.

I should think that by careful loading with a tube the same .40-caliber shell which is now loaded with 90 to 95 grains powder and 300 grains lead, could also be loaded with at least 80 to 85 grains powder and 425 to 450 grains lead, hollow-fronted bullet or not, as desired, and yet maintain the same length of cartridge. The liability to get them confused could be readily avoided by putting one charge in a dark colored copper shell, the other in a bright brass one. That one size of shell could in this way use two charges does not seem at all unreasonable to me.

Thus equipped and with a good, reliable rifle one could saunter forth with the positive assurance that if any animal gets away from or with him it will be in no wise the fault of his "iron," a most comforting thought indeed. To be assured that no one else has a better, more serviceable or more effective rifle than yourself is a source of a great deal of self-congratulation. And it is equally true that to feel that some one in the party has a rifle better than yours gives rise to a proportionate amount of bitter reflection and self-condemnation of your poor judgment in its selection.

I have been extremely gratified at the interest taken in this discussion, and am glad to get the views of so many who use the hunting rifle.

I may say that I heartily agree with some of the participants, and have no doubt that some of the rifles, or more especially the charges advocated by them, are extremely satisfactory.

In concluding, allow me to express the hope that manufacturers have not turned a deaf ear to these suggestions of your correspondents, which are founded upon "practical experience and observation," but have followed the discussion closely. If this be the case, I feel certain that it will be fruitful in good results, and that in consequence we will soon be able to note many improvements both in rifles and ammunition. D. M. B.

PHILADELPHIA.

Editor Forest and Stream:

[*Continued from page 9.*]

The first objection to the proposed repeater, .40-90-500, is that the ball will have a low initial velocity, and cannot have anything else. Its long-range power and penetration will be sufficient to satisfy any one. But to accomplish that, a great sacrifice of short-range efficiency must be made.

It seems absurd at this day to ask, why should a ball crawl out of a rifle at the rate of one thousand feet per second, when it can fly out at two? And yet there are thousands of hunters, and good ones too, who see no difference and even think of no difference. If the ball will shoot lengthwise through a deer, and will make the dust fly close to a stump at half a mile, they think it perfection and never dream of the high curve the ball must make to fall into the mark at 200 yards, and which causes so many unavoidable misses by even the best shots, the best adjusters of sights, and the best judges of distance.

I believe I was about the first one to attack the low velocity of American rifles. The position I then took in the old ROD AND GUN, has since been thoroughly sustained by the best hunters and writers; even by those who dissent from me upon some points, such as your correspondent "P.," Major Merrill and others being most emphatic upon this question. So great has been the weight of intelligent opinion upon this side, that the question has become quite one-sided, and flat trajectory at 150 or 200 yards is now considered by all thoughtful riflemen the second requisite of a good hunting rifle—accuracy being, of course, the first. In fact, it is incomprehensible to me, how any really good shot, who knows where he holds his sights when he pulls the trigger, could hunt much without finding out the great defect of the long bullet and light powder charge, and finding out the supreme importance of flattening the 150 or 200 yard trajectory every inch that is possible.

The velocity attainable by a 500-grain ball in a .40-caliber with 90 grains of powder, would be about the same as that of the long-range rifle—.44-100-550. The trajectory of this up to 200 yards is so high that it is a perfect nuisance for shooting at unknown distances; a mistake of only twenty-five yards being sufficient to miss or only slightly cripple a deer. And this velocity cannot be increased to any practical extent by bottling the shell, or by any method of rifling or otherwise.

Suppose a rod of lead of the same weight as the gun taken as the projectile and fired with a few grains of powder, both gun and projectile being suspended by strings. At the discharge they would move in opposite directions at equal rates of speed. Suppose, now, that the rod be cut off at each discharge until it becomes a mere wad of lead. The speed of the rod would constantly increase; that of the gun constantly diminish. But a far more important effect than this may be noticed, viz., that the shorter the projectile—the rod of lead—the greater the amount of powder that can be used in the gun with safety, and the greater the effect of every increase of powder in raising the velocity of the projectile. You may see the same in a shotgun. Take a No. 12 gun and put in two ounces of shot. You will find that the difference between three drams of powder and four drams is perceptible mainly upon your shoulder and but slightly upon the game, especially if the latter be something tough, like a duck. But cut down your shot to one ounce, and the difference is at once changed from the rear to the front. Now, put in an ounce of shot and you get still more penetration—though of course more scattering—from the same amount of powder, and get it, too, with still less recoil. And you can now increase the amount of powder with safety and comfort, and also with more effect in increasing penetration.

Now if a gun were made long enough to burn all the powder and allow the inertia of the shot to be fully overcome, heavy enough to prevent loss of force by recoil while the shot is getting under full headway, and also strong enough to stand the strain while the shot is getting its full headway, a very high velocity could be given three ounces of shot in a 12-bore gun—high enough to shoot a duck through and through. But such a gun could not be held to the shoulder by any ordinary man. Precisely the same principle applies to the rifle, though in a less marked degree. And I do not hesitate to say that no rifle that is light enough and short enough for use in the field can ever give a respectable initial velocity to a projectile having five times the weight of the round ball of the same caliber. And it follows unavoidably that whatever velocity you may give by increase of powder to the ball five times the weight of a round ball will be greatly excelled by the one four times the weight of the round one, that one by the one three times the weight, and so on down. And when you can make me believe that as much penetration can be given two ounces of shot as can be given to one ounce with the same powder you can make me believe that a 350 ball and 110 grains of powder from a .45-caliber is perfection for 200 yards. Cut off 100 grains of lead and add 40 more of powder, you get no more recoil, you get a great increase of velocity and consequently a flatter trajectory.

The question then arises will this have sufficient long-range power and penetration? It would retain its accuracy to at least 400 yards, and lose but little up to 500. It might not have quite enough penetration for bear and buffalo, and certainly would not if the ball were made expansive with a large hole in it. But it would shoot the solid ball lengthwise through the largest deer, and shoot through two deer placed side by side. It is quite certain that good, long-range power and good short-range efficiency cannot be combined in any rifle light enough and short enough to use in hunting without change of bullets and, in most cases, change of sights. The sooner this fact is recognized the better. And I believe it to be equally impossible to combine a good grizzly bear and buffalo rifle with a good deer and antelope rifle without making the same change or increasing the caliber and the weight of the gun. The sooner this fact is recognized the better.

I believe the most general understanding of the term "best hunting rifle" to be about as follows: The rifle that in the course of a year or more will hit the greatest amount of game and give its owner the least bother during that time. My private preference is for one that will kill within sight the largest amount of game actually struck. There are many who side with me in this view, though they may differ as to the manner of attaining the proposed end. But I believe the prevailing view to be the one that will hit the most, no matter when or where the game dies. Such a rifle must be:

First—A repeater, and of the quickest action possible.

Second—It must have the flattest possible trajectory for 200 yards.

Third—It must retain sufficient accuracy at 400 yards.

To have the flattest curve for 200 yards two things are indispensable.

First—High initial velocity; 2,000 feet a second if possible.

Second—Sufficient actual weight in the ball to sustain that velocity as far as possible against the resistance of the air.

The round ball starts quicker than any other, but has no staying power. The long-range ball has the staying power, but starts too slowly so make the 200 yards in time. The one is a quarter horse, the other a four-mile racer. Each one is unfit for the other's task, yet each excels in his own sphere. A compromise must be made between the two powers. Where shall the line be drawn? The question is not difficult to decide. One and one-half times the weight of the round ball gives to a rifle of .50-caliber nearly all the staying power that is needed for 200 yards; so does one and three-quarters to a .45-caliber, and twice the weight of round ball to a .40-caliber. Any increase beyond these quantities will, by decreasing the starting speed, destroy the effect of the additional staying power, and increase the curve of the path of the ball. Some increase may, however, be necessary for accuracy at 400 yards.

The shape of the head of the ball also makes a great difference in its staying powers. Such bullets as the Winchester .73 are too flat-headed for their weight. I believe, upon the whole, that the following weights will be found sufficient for accuracy at 400 yards, and it is certain that the 200-yard trajectory will be straighter than can possibly be given by any heavier ball: For .50-caliber, 300 grains; for .45-caliber, 250 grains; for .40-caliber, 200 grains.

To insure the accuracy at 400 yards, twenty-five grains might be added to each which would be sufficient except in heavy winds where anything but a long-range ball is too light.

Whether the penetration of these would be sufficient for grizzly bears or buffalo I cannot say. But I know, that by hardening the ball and sharpening its head, I can shoot any of them lengthwise through the largest deer (unless heavy bones be struck). In all cases let the powder be the very best and the quickest that accuracy will allow.

In the case of a repeater the amount of powder may be limited by the action, as is probably the case with the Winchester repeaters. But the shorter the bullet the more the shell may be bottle-shaped without danger. It is difficult to see why the barrel cannot be made thicker at the breech and tapered toward the muzzle. Or perhaps the breech might be reinforced with steel shrunk over it. Ninety grains of powder would do very well in a .40 caliber, but 120 would be so much better.

There seems to be a foolish fear of a decent charge of powder. Many a man will stand and shoot off-hand fifty shots at a target with 70 grains of powder and 450 grains of lead from a .45 rifle without a murmur, who would faint at the idea of shooting a cartridge in which the powder was doubled and the lead reduced one-half or more. Yet for solid comfort and safety I would rather shoot one hundred of the latter than fifty of the former. Against this objection to a decent powder charge it is useless to argue.

It is said by others that a rifle will not burn so much powder. Though a less proportionate amount may be burnt at each increase of the charge a greater actual amount will be.

A .40-caliber rifle will, with a round ball, show the effect of every half inch of powder up to nearly five inches. With fine strong powder I have seen the difference plainly, even after the weight of the powder exceeded the weight of the ball. By firing through screens and taking the line of the first two bullet holes this may by easily tested.

By some it is said "too much powder drives the ball wild." This is an old idea, and is doubtless true for some rifles. But rifling can easily be made that will hold any ball to its place. I know rifles fifty years old that are accurate under any amount of powder. When I used a muzzleloader I used as high as five fingers of powder, and never less than four, and never had any trouble with its accuracy. Increased powder may require a change of sights, and in that sense may drive the ball wild from any rifle. But if the rifling be

made right, and especially if the ball be hardened, five inches of powder may be shot behind short bullets without danger, discomfort or want of accuracy.

Not only may so much be shot, but for light bullets there is more necessity for much powder than there is with heavy ones. With a .40-caliber round ball the difference between 40 grains and 100 grains of powder, as indicated by the fall of the bullet at 100 yards, is enormous. One great cause of this is that the effect of the air's resistance in stopping velocity is increased. As a round ball offers more resistance than a ball of any other form, and as it has less weight to force its way against the air's resistance, it must be started at tip top speed in order to make a good flight for any distance beyond 60 or 70 yards. Now if a heavy charge is needed to give good trajectory to a round ball, it follows that the nearer a ball approaches the weight of the round one the greater the necessity of a heavy powder charge to maintain as far as possible the starting speed of the ball.

It is said by some that if the heavier ball remains longer in the barrel more powder must be burned, etc., and therefore more force obtained, etc. More force, undoubtedly, because the weight of the ball is the most important factor in momentum or force; but always less velocity. Otherwise it would be like weighting down a racer so as to make him strain his muscles more.

Short bullets and excessive powder charges I consider indispensable to a good hunting rifle. Combine these two in a repeater that can be worked as rapidly as the Winchester and I can see nothing more to be desired that is at all attainable. T. S. Van Dyke.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I think that your correspondent, "Backwoods," has started a very fruitful theme in his communication on "The Performance of Shotguns," in your issue of the 24th ult. My experience has been that for duck and fox shooting and all long range, heavy work, the muzzleloading shotgun goes far ahead of the breechloader in respect to penetration and pattern. An experienced duck shooter, who shoots for the Boston market in this vicinity every season, owns an armament of four double muzzleloading guns, ranging from eight to seventeen pounds weight, and he will not use a breechloader because ineffective at his ranges. I have heard others make the same criticism of the breechloader. Is it true? Let us hear from those who have had experience with both muzzle and breechloading shotguns. Paul Pastnor.

Burlington, Vt.

Editor Forest and Stream:

In your issue of Jan. 24, "Backwoods" has asked for just what I want to know; what a shotgun will do. There are no doubt a great many readers of Forest and Stream who have fired thousands of shots with breechloading guns, both at game and the target, let them give us their experience.

I have been greatly interested in reading "The Choice of Hunting Rifles," and hope that all letters about shotguns may be as plain and instructive as the letters regarding rifles have been. I have sold my muzzleloading shotgun and want a breechloader. I thought I would like a 12-gauge best, but several of my friends who have owned and shot both 10 and 12-gauge, advise me to get a ten, and as I can not afford two guns I would like to know which would be best for all purposes for quail, squirrels, ducks, and other small game, and if I ever should be lucky enough to go deer hunting I would want to use it to shoot buckshot.

What I would like to know most is how much further will a 10-gauge kill its game than a 12, both guns of same grade and bored on same principle. For example, if a 12 will kill at 40 yards, how much further would the ten kill the same game? Buckeye.

Summit Station, Ohio.

WASHINGTON TERRITORY GAME LAW.

Editor Forest and Stream:

I send you copy of the new Washington Territory game law, passed at the fall session of the Legislature in 1883. In many respects it is admirable. The provisions concerningnight shooting and sink-boxes were mainly introduced for the sake of the Columbia River shooting, in which Portlanders are as much interested as though the river was wholly in Oregon. No sink-boxes or swivel-boxes have ever yet been used on the Columbia (that is not to any extent), but no one wants to have them even tried, and fearing some Eastern speculators might introduce them, they have been anticipated. But night shooting is quite common and very pernicious. The law ought to have included swan, as the night shooting is chiefly while in pursuit of them. I hope the Oregon Legislature (this fall) will adopt all the better suggestions in the Washington law, and set as good an example by inserting some additional features. The "pheasant" referred to in the law will no doubt include the Mongolian pheasants, which have become quite numerous on some of the islands in Fuca Straits. The canvas-back pair here in the spring, and hence the necessity of protecting them after April 1, which if anything is too late. March 15 for all would be better. E. W. B.

Portland, Oregon, 1884.

Following is the full text of the law:

Section 1. Be it enacted by the legislative Assembly of the Territory of Washington: That every person who shall,within the Territory of Washington, between the first day of January and the fifteenth day of August, from and after the passage of this act, pursue, hunt, take, kill or destroy any deer or fawn, shall be deemed guilty of a misdemeanor. Every person who, after the passage of this act, shall take, kill or destroy any deer at any time unless the carcass of such animal is used or preserved by the person slaying it, or is sold for food, is guilty of a misdemeanor. Every person who after the passage of this act, shall hunt or pursue deer with dog or dogs, in the counties of Thurston, Cowlitz, Whatcom, Island or Lewis, shall be guilty of a misdemeanor.

Sec. 2. Every person who buys, sells, or has in possession any deer or fawn within the time the taking or killing thereof is prohibited, except such as are tamed or kept for show or curiosity, is guilty of a misdemeanor.

Sec. 3. Every person who shall, in the Territory of Washington, between the first day of January and the fifteenth day of August of each year, hunt, pursue, take, kill or destroy any elk, moose or mountain sheep, shall be guilty of a misdemeanor. Every person who takes, kills, injures or destroys, or pursues with intent to take, kill, injure or destroy any elk, moose or mountain sheep, at any time for the sole purpose of obtaining the skin, hide, hams or antlers of any such animal, shall be guilty of a misdemeanor.

Sec. 4. Every person who shall, within the Territory of Washington, between the first day of April and the fifteenth day of August of each year, take, kill, injure or destroy, or have in possession, sell or offer for sale any wild swan, mallard duck, wood duck, widgeon, teal, butter-ball, spoonbill, gray, black sprigtail or canvas-back duck, shall be guilty of a misdemeanor. *Provided*, that any person may kill on his own premises ducks or deer to protect his growing crops.

Sec. 5. Every person who shall, within the Territory of Washington, between the first day of January and the fifteenth day of August of each year, for any purpose take, kill, injure or destroy, or have in possession, sell or offer for sale, any prairie chicken or sage hen, shall be guilty of a misdemeanor.

Sec. 6. Every person who shall, within the Territory of Washington, between the first day of January and the first day of August, of each year, kill, injure or destroy, or have in possession, sell, or offer for sale, any grouse, pheasant, quail or partridge, shall be guilty of a misdemeanor.

Sec. 7. Every person who shall, within the Territory of Washington, during the months of November, December, January, February and March of any year, catch, kill, or have in possession, sell or offer for sale, any mountain or brook trout, shall be guilty of a misdemeanor. Every person who shall, within the Territory of Washington, take, or attempt to take, or catch with any seine, net, wier, or other device than hook and line, any mountain, brook or bull trout, at any time after the passage of this act, shall be guilty of a misdemeanor.

Sec. 8. Every person who shall, within the Territory of Washington, at any time after the passage of this act, trap, net or ensnare, or attempt to trap, net or ensnare any variety of quail, prairie chicken, grouse or pheasant, except for the purpose of propagating the same, or who shall in any county east of the Cascade range of mountains prior to year eighteen hundred and eighty-seven, kill any variety of quail, shall be guilty of a misdemeanor.

Sec. 9. Every person who shall, within the Territory of Washington, at any time after the passage of this act, destroy or remove from the nest of any mallard duck, widgeon, wood duck, teal, butter-ball, spoonbill, gray, black, sprigtail or canvas-back duck, prairie chicken or sage hen, grouse, pheasant, quail, partridge or other wildfowl any egg or eggs, or wilfully destroy the nest of any such fowls or birds, shall be guilty of a misdemeanor.

Sec. 10. Every person who shall, within the Territory of Washington, have any male deer or buck, or any female deer or doe, or spotted fawn, elk, moose or mountain sheep, swan, mallard duck, wood duck, widgeon, teal, butter-ball, spoonbill, gray, black, sprigtail or canvas-back duck, prairie chicken or sage hen, grouse, pheasant, quail, Bob White or partridge, mountain or brook trout, at any time when it is unlawful to take or kill the same as provided in this act, shall be guilty of a misdemeanor, and proof of the possession of any of the aforesaid animals, fowls, birds or fish, at any time when it is unlawful to take or kill the same in the county where the same game is found shall be *prima facie* evidence in any prosecution for a violation of this act, that the person or persons in whose possession the same is found, took, killed or destroyed the same in the county wherein the same is found, during the period when it was unlawful to take, kill or destroy the same.

Sec. 11. Every person who shall, within the Territory of Washington, take, kill, shoot at, maim or destroy any mallard duck, wood duck, widgeon, teal, butter-ball, spoonbill, gray, black, sprigtail or canvas-back duck, at any time between the hours of 8 P. M. and 5 A. M. shall be guilty of a misdemeanor.

Sec. 12. Every person who shall use any sink-box on any lake or river or other waters in Washington Territory, for the purpose of shooting ducks or other waterfowl therefrom, or who shall use any batteries or swivel or pivot gun on boats, canoes, rafts or other device at any time for the purpose of killing any waterfowl within the limits of Washington Territory, shall be guilty of a misdemeanor.

Sec. 13. Every person convicted of the violation of any of the provisions of this act shall be punished by a fine of not less than ten dollars and not more than three hundred dollars, or imprisonment in the county jail of the county where the offense was committed for not less than five days nor more than three months, or both imprisonment and fine. One-half of all money collected for fines for violation of the provisions of this act shall be paid to informers, and one-half to the prosecuting attorney in the district in which the case is prosecuted.

Sec. 14. All acts and parts of acts in conflict herewith are hereby repealed.

Sagadahoc County Association.—Bath, Me., Feb. 1.—The annual meeting of the Sagadahoc Association for the Protection of Fish and Game, was held in this city on the evening of the 29th ult., and the following officers were elected: Dr. Chas. A. Packard, President; A. Q. Gond and James H. Millay, Vice-Presidents. Executive Committee—S. W. Carr, A. Q. Gond, Geo. H. Nichols, Dr. E. W. Johnson and A. S. Alexander. Geo. E. Newman, Secretary and Treasurer. A special committee was chosen to take such measures as they might deem proper to prosecute violators of our fish and game laws. The public sentiment in regard to the necessity of a rigid enforcement of the fish and game laws is growing every day in this vicinity, and we trust ere long the destruction of our game during the close season will come to an end.

Sea and River Fishing.

THE STRICKEN TROUT.

Beneath a time-scarr'd oak, whose leafy boughs
Still in its age, when summer's sun beats down
In heat of day, throw grateful shade above
A grassy mound that slopes down to the brook,
Just where a little rill, with gurgling sound,
Creeps through the tangled grass, on further side,
To reach a deep, dark pool, an angler stands
In cautious silence, and with bated breath,
With rod, and reel, and line of braided silk,
End-tip'd with gut and trimm'd with chosen flies,
In hand uplifted for a skillful cast.
With circling glance his eye takes in the field
Of pastures fresh, where feed the luscious trout,
Who dine not always at the stroke of twelve:
But rising from their pebbly beds they seize
The luckless insects floating down the stream,
And straightway turn to hiding-place again.
The cast is made, and swiftly through the air,
With whistling sound, the feather'd hooks disport
Their gaudy wings, in life-like flutt'ring play,
Upon the glist'ning surface of the pool,
Above the place where, half embosom'd lies
A mossy log, low stretched across the way,
And deep below the darken'd waters glide,
With noiseless murm'ring, o'er their oozy bed.
Scarce settled they upon the liquid board,
When swirling water, and a silv'ry gleam,
Sure indicates the game at hand; but haste
To seize the lure thus temptingly displayed,
Made failure, and invites another cast.
The line recovered, now sweeps back and forth,
And glitt'ring wings flit gaily through the air,
As almost motionless the angler stands,
With steady nerve, and eye fixed on the spot
Where he again would spread the fatal cloth
To tempt this monster trout; or, if perchance,
Through gallantry, should he permit his mate
To choose the gaudiest fly, ere he should taste
What seems provision for their midday meal.
Alas for her! A splash, the water boils,
And centric circles, lapping on each shore
As tiny wavelets, break upon the sand,
And leave no trace of that which went before.
With magic thrill the angler feels his rod
Bend gently through the tight'ning line, that cleaves
With hissing sound the water's darken'd depth.
And strains the lancewood tip, as if 'twould break
The slender thing in twain; the reel, meantime,
Yields up its silken cord, as now the trout
Turns to his lair, and seeks a safe retreat.
Where he may gorge the dainty morsel caught,
And plume his speckl'd sides on slimy stone.
With gentle strike the fish is fairly hooked,
And feels the sting that fastens in his mouth
The strange device, that seemed a living thing,
Born but for a day of life's fitful dream,
Whose dawn is sunshine, but whose eve is death.
Alas! the fatal strike; 'tis now revealed,
That barbed steel was hid beneath the fold
Of wings, by man so cunningly devised:
And what seemed fair to eat at once, now shows
That joys delusive may be robed in gold,
Which glitters but to tantalize with pain.
In wild affright, the fish around the pool
Darts furiously, and, finding no relief,
Leaps high into the air, as if to spew
From out his mouth the tinseled, cheating bait,
That to his hungry eyes has proved deceit.
Now sulks he low, to nurse awhile his wrath,
Which waxes fiercer as the fight goes on;
Then, like an arrow from the bended bow,
He shoots athwart the stream to yonder rock,
Beneath whose shelt'ring ledge he fain would find
Some friendly hand to loose from out his jaw
The cruel hook, that tears his quiv'ring flesh,
Or snap the gut that joins it to the line.
Despairing now, in agony he flies
From out the pool, and seeks yet to escape
Adown the rapid's rough and rocky way,
Which leads into a deep and dang'rous hole.
Where logs and roots oft hid the lurking trout,
And fain would shelter one in saddest plight,
Who, stricken with the angler's fatal lure,
Now strives with all his might to reach alive,
In spite of rod and reel and silk to boot.
But fate yet lingers in the captor's hand,
Whose rapid footsteps, though they often sink
Deep into miry holes along the bank,
Keep with him apace, as, o'er brush and brake,
Deftly he bears the bending rod and keeps
Taut line on flying captive, lest the hook,
From loosened hold, should backward empty fly,
To his disgust, and let the fish go free.
The angler's quick-discerning eye detects
His victim's last resort, and how to check
This downward, mad'ning flight, and save the game,
Takes but a moment's thought. On further side,
Below a little spur of bank, he sees
The current eddying flow, where neither rock
Nor log can shield the trout, or rend in twain
The thread-like line that quivers in the air.
And, plunging in the stream, he wades adown
The rapid's fitful rush, while tip of rod,
In graceful modesty, stoops low to kiss
Its master's hand. The weary, stricken trout
Accepts the cunning ruse as for his good,
A resting place at last to find, where he
May strength by time regain, while quickly now
The angler, reeling up his line, seeks yet
To turn the fish's head up stream, that he
May still another chance for life try on,
And in the further struggle spend his strength,
So much exhausted. Gaining now the bank
At point below, he gently leads the trout
From out beneath the shelving bank, where he
With panting breath in moody silence lay,
In hopes that he may take the rapids back
To pool above. The strategy succeeds;
And click of reel and swift out-paying line
But lengthens out to him life's anxious span
One short moment longer. Oh, precious time!
How sweet to him, who fain would linger yet
Upon the shore of that dark, flowing tide
That bears the soul into eternity.
With nerve and muscle strained to utmost pitch,
The victim leaps amid the stream, and cleaves
The surging waters with his angry tail,
In one more desperate lunge for liberty.
But, no; the slack'ning line foretells the close
Of this unequal strife. The angler now
Plies rapidly his reel, through whose recoil
The fish and fisher come to closer terms,
And gleaming in the sun, on ripples' crest,
The stricken beauty yields to greater odds,
And ere he is aware, the treach'rous net.
A captive lands him gasping on the sand.

Canandaigua, N. Y. C. T. Mitchel, M. D.

MATERIALS FOR FLY-RODS.

In the hope that your readers may give their experiments, I send the following as a beginning, simply suggesting to those who can to give also the breaking strain. Two sticks of the same length, four feet, were used, one lancewood and the other bethabara wood. One end was held in a vise and the other fastened to a spring scale. They were drawn six inches from the natural line and so held five minutes, after releasing the curvature from the natural line was taken.

	Size.	Weight.	Power required.	Curvature.
Lancewood	⅞ square.	1 lb. 1 oz.	8 lbs.	½ inch.
Bethabara	13-16 square.	1 lb. 4 oz.	9 lbs. 14 oz.	⅛ inch.

Judging from the above, and allowing the breaking strain to be equal, I should prefer a rod of bethabara wood. The extra weight would be equalized by its greater life, and so may be made smaller. R. H. Dixon.

THE BEST COLOR FOR LEADERS.

SOME EXPERIMENTS TO DETERMINE IT.

EVERY angler has heard, or taken part in discussing the best color for leaders, and, if it be permissible to judge of the experience of others by one's own, then such discussions invariably amount to the expression by one of a doubt whether the color makes much difference, and a more or less ready assent to this on the part of the others. Never has the writer met any definite opinion on this subject based upon anything stronger than a guess.

This is not as it should be. Why cannot anglers discuss the mysteries of their craft with the fervor that "The Choice of Hunting Rifles" excites in those who seek their recreation in that direction.

As in past years, so every evening last September, a band of anglers, from many distant cities and States, gathered around the camp-fire at Parmachcene Lake in Maine, many of them artists in the use of the fly-rod, and true sportsmen all. And when the subject of this article had again and again been brought up, again and again with the same negative result, the writer determined that before the next season he would try to devise some method, if not to determine, at least to throw some light on this question.

His experiments have been tried for the information of himself and friends. The results are published in the hope that others may be induced to investigate the matter, and that lively discussion and an ultimate solution of this question may follow.

It seemed necessary to view the leader from the same direction as the trout. So a water-tight box was made 28 inches long, 6 inches wide, 4 inches in the remaining direction, all inside measurements, and painted mud color inside. One end was left open, and the other closed with a thick plate of glass. A frame was provided in which the box would swing like a cannon on its trunnions, and so arranged, that though the normal position of the box was perpendicular with the glass below and the open end above, yet it could be inclined and the upper end directed to any part of the sky.

For the purpose of experiment, uncolored, coffee-colored, and mist-colored leaders of three shades were procured. Also three samples of No. 4 enamelled water-proof line, yellowish, greenish and brownish in color.

The box was filled with water, the samples moved about upon and beneath the surface, while the writer with his head and the glass end of the box wrapped in a dark cloth, *à la* photographer, directed the apparatus toward the sky, and noted the result.

From viewing the under surface of a body of water contained in an aquarium through the lower portion of its glass sides, it was expected that the under surface of the water in the box or tube might look like a mirror, and vision of anything above the surface be cut off. Such was not the case. Objects above the surface could be seen distinctly as through a glass window.

The variously colored leaders were all alike conspicuous to a surprising degree, so much so as to cause wonder that a fish should ever rise to anything connected with them, and this whether above, on, or below the surface of the water. It seemed as though the coffee-colored leader was the most visible; but otherwise one could not be told from the other, all difference of color seeming lost. Then some drawn mist-colored leader was tried, quite dark in tint and as fine as a hair. Though about as plain to sight as a pencil mark on white paper, yet it was apparent that its small diameter made a great difference in its favor.

During all this, the idea was gradually gathering force that these experiments only tended to show how the object appeared when viewed by a fish lying directly beneath it. And upon trying some flies, and finding that only with difficulty could the gaudy be distinguished from those sober in color, the box was dropped and light sought in another direction.

A bath tub of considerable size, its length facing a window and the sky, was filled with water to the depth of fourteen inches. Two mirrors were submerged in the water, one at each end of the tub, and so inclined that by looking down upon them the reflected image of anything in or upon the water could be readily seen. A joint from a rod was used to manipulate a short line and the leader to be experimented with; and, by moving it to and fro in the water, it could be viewed at almost any degree of obliquity.

Here, again, the results were a surprise. Though I have always used a colored leader, still I had supposed color was of questionable utility. Such seemed not to be the case. The coffee color was still the most conspicuous, but it was but little more so than the natural colored gut, which latter in all positions and angles looked like a streak of silver. The mist-colored leaders in some positions had the same appearance, but always it seemed in a less degree; while at times, and at certain angles and directions of motion with reference to the light, they seemed to more or less disappear. The darkest tinted, a decided azure, gave the best result. I was unable to determine with satisfactory certainty in what positions in reference to light, etc., this partial or total disappearance took place. It certainly did seem that when the leader was moved toward the light it shone the most, and by the refraction of transmitted light, and I attributed the better result given by the darker leader to its greater opacity to such light. A piece of iron binding wire, black in color and, of course, totally opaque and of about the same diameter as the leaders, was, however, plainly visible in all positions, though not more so than uncolored gut. Indeed, I incline to think that at all times the least conspicuous leader that can be made may be plainly seen from some directions, while at the same time invisible from others.

Here, again, I was impressed by the great difference in result caused by varying the diameter. This dimension appears in the water to be much enlarged, and my experiments are emphatic as to the utility of fine tackle. This was demonstrated beyond question by the drawn gut; *i. e.*, gut drawn through a plate, which, as before stated, was quite dark in color and hair fine.

The various samples of line were all equally visible—"plain as a pike staff"—and not the slightest difference in favor of one over the other could be detected.

It is to be understood that the appearances described are those shown by reflection in the mirror; also that all gut used in experiments as to color was of the same diameter.

Quite a number of interesting phenomena presented themselves during this investigation, but it seems better to pass them by at present, until by repetition and variety of experiment mistaken deductions may be avoided. Indeed, while writing the foregoing, an apparatus has suggested itself which it would seem ought not only to settle this question definitely, but afford practical information as to the visibility to trout of objects situated above the water. But this must be used in the open air, so longer days and a temperature above freezing must be awaited.

In the mean time, if those who dye leaders would be kind enough to forward to the FOREST AND STREAM office samples of any color they wish tested, they will confer a favor. These should be about three feet long, and as near as possible No. 27 or 28 Stubbs wire gauge in thickness, so that difference in diameter need not be taken into account in the comparisons. It will be readily apparent that when two samples differ not only in color, but in thickness, it would be difficult to apportion to the thicker a just allowance for the difference.

The moral deduced for my own guidance from the above, is offered to others for what it is worth.

In the first place, neither anglers nor trout are anything like as smart as is generally supposed. The wiles of the former are by no means so well concealed, nor are the senses of the latter so very acute to perceive them. Use an azure or mist-colored leader, of considerable depth of color, but above all things let it be fine in diameter. The strain of the largest trout is trifling. The best of those that swim in the Rangeley Lakes cannot pull one pound on a flexible rod. (This article is not intended for "derrickers.") Upon trial last June, with a ten-foot rod drawing on a spring balance with one hand, butt away from body, the strongest among a half dozen anglers, and he a man of muscle, could with his utmost effort—such an effort that the rod fairly quivered—scarcely raise a strain of 1¼ pounds. The experiment was tried at my instance to convince a sceptic, and I myself took a pull and pulled "my level best." The very next morning I took a trout of five pounds and two ounces after a twenty-minutes' fight, and I am confident that at no time did his pull at the outside exceed half a pound.

The thickness of leader habitually used in the Rangeley region of Maine—and there if anywhere a large leader is excusable since the trout are there larger than elsewhere—is simply preposterous. Of course one should be prepared for the largest trout in the swim. If he is five pounds, a leader that will stand 3½ pounds strain with a spring balance is ample to withstand the roughest treatment that a flexible rod can inflict. If after a 10-pounder, a 5-pound test will meet every emergency. This can be had with very thin gut—No. 27 or 28 Stubbs wire gauge. With thinner gut than this, last September a friend fastened a trout of 4½ pounds (weighed to the ounce, not guessed at) in a dangerous place, and not only held him without giving an inch of line, but hung to him until his guide took the boat into clear water and towed the fish after—water slack and small salmon fly.

Last June with such a leader a trout of 1½ pounds was harnessed 4 inches in front of the tail at the head of heavy rapids, with what the lumbermen call "a driving pitch" on. Down current he went, taking nearly 45 yards of line. Then he was stopped, and derricked up against the current without a pause, unhooked, weighed, and returned to the water, larger fish only being at that time desired.

If any reader unfamiliar with this wire gauge, should wish to know the thickness referred to, it can be had by calling for wire of that number at any hardware store, but ask for Stubbs gauge, as there are others, and like numbers do not represent like sizes in all such measuring instruments.

But, and every letter of this "but" should be in three-inch capitals, such a leader, after it has been coiled up, whether perfectly fresh or after use, should never be attached to the line without first testing it with a spring balance. I think this equally true as to every leader of whatever caliber, but light leaders only are now under consideration. In these days when spring balances which are accurate—at any rate mine has been proved so—and which will weigh every two ounces up to ten pounds, can be bought for 50 cents, an angler should as soon think of being without one when on the war-path as without a pocket-knife.

Soften two leaders in cold or tepid water, not hot water, since it dissolves the gluten and impairs the strength of the gut. While a friend holds one loop of the leader on a match or similar slip of soft wood without sharp edges, hook your spring balance into the loop at the other end. Let each grasp the leader between his thumb and finger as far toward the middle as he can comfortably reach, so that if it breaks you may not have to hunt up the ends, and then put on the strain. It breaks at half a pound? Well, sometimes it has accidentally received a sharp bend when dry, and the gut has been partially cracked into. Tie it up, and try again. It stands four and a half pounds? That is enough for anything to be taken on a trout-rod. Put one leader to your line, the other wind round your hat, so that if you foul a snag and are obliged to break the first, you will have the other in reserve.

A friend last September was about to cast his first fly in Maine waters. Besides leaders fit to hold a shark, he had half a dozen nice ones that he had bought for Adirondack fishing. He was recommended to test, and if strong enough, to use the latter. Not one on the first test stood over half a pound. Some broke three times, but not one failed at last to come up to 4½ pounds with less than 9 inches loss of length. Gentlemen who have been in the habit of using heavy leaders, try it, and you will have no cause for regret. I have made four trips to the Rangeley region and beyond, on this theory and practice, two of five and two of three weeks actual daily fishing, and I have not lost a single fish during that time by the breaking of my leader.

There; I have said my say, and have given about all I now know of the matter.

Is there no other willing to ventilate his views on this, or any other kindred subject dear to the angler? There are a hundred things the fraternity thirsts for knowledge on. Take the subject of dyeing or coloring gut. Some black inks give the right color, but I find a loss of from 15 to 30 per cent. in strength from any method of coloring I have yet discovered.

Why cannot some one try this and give us the results. Soak his gut soft, tie in a loop at each end, pull it with spring balance till it breaks, knot it together and color, break it again in same way, compare its strength before and after, and he will soon hit on something that will be a boon to all, except possibly, the dealers in such articles.

What is the use of the customary dowel-pin in joining trout rods? For fourteen years I have been making rods as an amateur, and as yet I have discovered nothing in its favor. Who is the apostle of the dowel-pin? Subjects bristle on every side, a discussion of which would be profitable. Remember the dealers rely largely on the fishermen to suggest improvements. There is no one who has had any extended experience in the field who does not know something worth telling, and to tell it is a duty he owes to the craft. And now is the time to do this, when we can only angle in our dreams, and everything relating to it is relished as is the spring by him who wanders in the desert.

HENRY P. WELLS.

NEW YORK CITY.

TROUTING ON THE BIGOSH.

A NIGHT IN CAMP.

AS JACK and I reached camp Uncle Ben had supper ready, and the Doctor and the Colonel were just rowing in. A peep into the boat showed that they had not fished in vain, for there lay three lake trout of about four pounds each and some fish of other kinds, which they were disputing about, but the Colonel was too hungry to want them identified, or even talked about until he had an interview with the bean soup, broiled trout and potatoes roasted in the ashes. The account that the Doctor gives of the Colonel's appetite on this occasion appears to be so much exaggerated that I will not record it, believing, as I do, that it was prompted by a disappointment in the disposition of the last trout and baked potato. Besides, I hold firmly to the opinion that for a man who has gone to the woods to regain appetite and health, one quart of bean soup, half of a three-pound trout, eleven baked potatoes, a loaf and a half of bread and four cups of coffee ought to make a fair supper during his first week out, or until he has fairly come into his appetite. The Doctor certainly should understand this question better than I, and never should have allowed himself to reach for the last potato at the same time the Colonel did, and, when he missed it, to ask Uncle Ben what time he intended to have breakfast.

The stars were on duty by the time the pipes were lit, and the light evening breeze lapped and rippled under the boat, while from the opposite shore a deep-throated bullfrog sent echoes which reverberated from shore to shore. We smoked in silence, taking in the beauty of the moon-rise which, reflected on the rippling water, seemed a stream of molten silver. A bat wheeled round and across the moon and a musk-rat plunged sullenly from the bank into the water, startling a youthful frog, which squeaked with fear as it skipped over the surface and disappeared. The low, liquid note of some small night bird came through the trees like a lost note from some elfin flute, and the fiendish laugh of an owl on a dead pine floated across the water, suggesting a demon strayed into paradise.

The Doctor refilled his pipe and puffed in silence, absorbed in contemplation of the beauty of the scene. Even the unpoetical Colonel seemed wrapped in delight, and all were taking in the pleasures of the summer night that appealed to both eye and ear, when from the cove at the eastern end of the lake there arose a cry at once so weird, unearthly, and startling, that the Colonel dropped his pipe and asked in a low tone, "What is that?"

No one answered, for all knew the sound except the Colonel and Jack, and we enjoyed his surprise. A few moments of silence and the sound came again, louder and longer. "What in the world is it?" again asked the Colonel.

"It's one o' them air loons," answered Uncle Ben; "he's lost his mate. Keep still and you'll hear her answer him soon."

Once more the call sounded, louder and clearer, and a low gutteral answer came from the other side of the point, and all was still again for a moment. A fleecy cloud drifted across the moon, and when it had passed and the full rays again silvered the treetops and the lake, the frog rolled out its basso-profundo, the wood thrush trilled a low and sweet tremolo, and the lonesome owl expressed his contempt for their music by a scornful laugh. But the loon remained silent. It had found its mate, and was satisfied.

The Doctor knocked the ashes, which had long been cold, from his pipe and started for bed. All followed, each too full of his own thoughts to say much, except Uncle Ben, who deemed it his duty to break the silence by saying: "By gosh, this is a beautiful night." Some one said "yes," and then Jack asked; "How about the strange fish? Will you look at them before going to bed?"

"No, Jack, not to-night." And we slept to the rippling music of the water on the beach and its rhythmical lapping under the boat.

FRED MATHER.

TAKING SMELTS THROUGH THE ICE.

ON Monday afternoon a *Journal* representative took a tramp up the river among the smelt fishers. There are twenty-three cosy tents on the ice, fifteen of which are in a cluster, or rather in a row, close together off Kaler's mill. Four tents are off Beaver's Tail and the others are scattered along the western shore. The fishermen all said: "This is the best season for fish we ever knew, or at least for many years." As soon as the ice was of sufficient strength the fishermen placed their tents thereon. The smelts were there in plenty and took the hook readily. In fact, before the river was frozen Mr. Fred Cottrell caught large quantities from the shore with a line attached to a pole. Entering the tent of Mr. Joseph H. Trussell, one of the successful fishermen, he politely gave us his chair, and with a board across the head of a small keg he improvised a seat for himself. His tent is a frame about five feet square and six feet high, at the ridge pole covered with drilling. The covering is painted to better protect the fishermen from the wind. A small coal stove is at one side, the pipe leading out through the roof. The fire not only keeps the tent warm but heats the fisherman's dinner. The floor is boarded, with the exception of a square space with a corresponding hole in the ice. Through this opening and made fast to a rack above four lines are suspended, each having a single hook. The lines used in outdoor fishing have each two hooks. The lines are kept down by a lead sinker, to the lower end of which the snell and hook are attached. The hooks are baited with clam worms dug from the flats. Seated on a chair the fisherman thumbs his lines with as much comfort as though by the fireside in his own house.

Some of the tents are double and contain two fishermen with a double set of gear. The single ones are considered the best, as two persons will make more or less noise. The fish bite better on the ebb tide when they are moving down the river. This cannot always be relied upon, however, for some days they take the hook readily and at other times sparingly. It has been observed that the smelt bite better on cold, stormy days. Last Saturday as many as sixty pounds per man were caught. At such times the fisherman has brisk work with his four lines. Mr. Trussell thinks there are two different varieties of smelts—one he classes as the school smelt and the other as the permanent smelt—those that are always to be found in the river. The school smelt, he thinks, moves about from place to place and take the

hook most readily. This smelt has a very light-colored back while the other has a dark-colored back. The fishermen all thought that smelts would be more plentiful in our waters if the milldams were provided with fishways. Goose River, the Wilson stream and Gurney's are dammed so that the fish are unable to ascend to deposit their spawn, and are obliged to spawn along the rocks, where they are mostly destroyed.

A correspondent of the New York *Times* recently wrote an article on smelt fishing in Maine and gave the credit of first fishing in the covered tent to one Joe Secor, of Boston. The correspondent says that Joe froze his ears and feet while fishing out of doors on one of our Maine rivers and gave it up. "But he didn't go home. He went to Belfast and had a heavy wooden frame, ten feet square, made by a carpenter. He procured some sail canvas, and covered the frame with it, leaving an opening for a door. The frame was on runners. When the 'house' was finished he had it drawn upon the ice and placed over the holes he intended to fish through. Then it occurred to him that he might add still further to his comfort, and he bought a small box stove, ran a pipe from out of the house, started a roaring pine wood fire in it, and seated on a bench, fished as comfortably as if he were in his room at the hotel watching a stope-pipe hole in the floor. The house was secured to the ice by grappling irons. If smelt ceased biting in one spot he simply loosened his grapples, shoved his house along on the runners, and 'squatted' in more favorable quarters."

We inquired of the fishermen if they ever knew or heard of Joe Secor, but without avail. So far as Belfast is concerned Joe is a myth. John Richards is the pioneer tent fisherman of Belfast. He was the first to use the canvas-covered tent, which was seven or eight years ago. We found him on Monday seated in a comfortable tent with a fair catch of fish by his side. When the fish do not bite the men amuse themselves by singing, story telling and by chaffing with the teamsters who drive along the banks of the river. Occasionally one of the fishermen will fall into a fishing hole that has been covered over by the fallen snow. At such times the unlucky fisherman is pulled out in a sorry plight amid the shouts of his companions. The fishermen are a jolly set and make their avocation a pleasant one. Fair wages are made at a time when little else can be done. While in the tent Mr. Trussell gave the *Journal* local two lines. Now a fishing line is no new thing to us, as we have often handled it for both pleasure and profit. The fish did not bite very briskly, but after an hour's angling the newspaper man had the satisfaction of beating the proprietor. The fish are mostly sold to Sleeper & Field, in this city, who ship them frozen to the Boston, New York and Philadelphia markets. The fish are nicely packed in a box, back down, and will keep for a long time.—*Belfast (Me.) Journal.*

FISHING IN MICHIGAN.

THE past season here has been good for fishing, and has been thoroughly enjoyed by ye local fisherman and by some from outside, one party coming from Kentucky and stopping at Bear Lake Village, on the shore of Bear Lake, one of the most beautiful lakes I ever saw, being alive with game fish. Five miles from there is the head waters of Bear Creek, and it is eleven miles to the Betsy River; the latter has grayling and the river trout. Bear Lake is eighteen miles north of here; two daily lines of boats leave here and connect at Pierport with the narrow-gauge Bear Lake & Eastern Railroad to Bear Lake, five miles. We also have a daily line of boats from Chicago. Southern and Eastern routes are *via* F. & P. M. R. R. and C. W. M. R. R. Finer fishing cannot be found in any State or county. Au Sable Lake, thirteen miles south of here, is the largest one we have of the chain; it is twelve miles long, with an average width of one and a half miles. Partage Lake, eleven miles north; boats stop here daily at the Anickema Mineral Springs.

Messrs. John Higgins, Bidleman, Cox and Caraton caught in Partage Lake in three hours twenty-eight black bass, weighing 123 pounds. All were taken with flies on June 25, 1882. John Higgins, by the way, is a thorough sportsman and a gentleman that many are indebted to for favors shown being always ready and willing to help and assist others. He has fished all of the streams and lakes in this country. Should any of the readers of FOREST AND STREAM come this way, I will assure them of cordial treatment if they are lucky enough to fall into genial John's hands. I wish to say to my readers that this is no scheme to advertise any hotel (and we have good ones), railroad or corporation. Trout hogs and counters are not wanted, but gentlemen will find friends and well-wishers. Any information I can give to your readers will be cheerfully furnished.

S. E. B.

MANISTEE, Mich., Jan. 12.

LAW BREAKERS IN MAINE.—Oxford, Me., Jan. 27.—*Editor Forest and Stream:* There have been many complaints from this State concerning the persistent breaking of the game laws, but I do not think there have been many instances where these laws have been broken so boldly and defiantly as is being done now on Thompson's Pond, in Oxford. Since about the 26th of October our trout and togue with which these waters teem have known no peace. The torchlights of a dozen boats engaged in spearing these fish could be plainly seen from the streets of the village, any still night last fall. One boat brought in sixty-five trout, weighing from two to three pounds each, one night last fall, from off the spawning beds, and how many more were destroyed by killing these fish I will leave to the public to decide. Over 800 trout have been caught through the ice since it first froze. The fishermen boldly declare that they will catch what they want for their own use and the surplus they will sell. These trout are being sold at Norway and Mechanic Falls, and strings of them are being carried in plain sight daily through the streets of Oxford. Now for my part I can't see where the harm comes in catching the trout through the ice, but if one can't do it stop all. I am strongly against spearing and think that a stop had ought to be put to it at any cost in this paradise for the angler. Our local papers have an account nearly every week of some one making an unusual catch, so you see how badly these laws are broken.—JOSH JEEMS.

ANGLING SLANG.—New York, Feb. 4.—*Editor Forest and Stream:* The editorial note on "Angling Slang," in your last issue, struck hard at the use of certain low phrases which pass for wit among a certain class, who either do not write for FOREST AND STREAM, or, if they do, their obnoxious pet words are stricken out. Some time ago I read in a paper (casually picked up at a country hotel) an article containing all the vile words mentioned by you, as "rodster," "chucking a bug," etc., and which wound up by speaking of a gentleman who was an expert fly-caster, in this way: "They all saw that he was master of the art, and he certainly slings a nasty fly." If, as I suppose, the writer thought it a clever saying, it is doubtful if the gentleman who was intended to be complimented thought so. I think that "rodster," for angler or fisherman, is of English origin, but, "bug chucking" is of native growth. I rejoice to see you attack this evil practice.—G.

THE LEAP OF THE GRAYLING.—It is now in order to discuss the leaping powers of the grayling. The subject has been brought up by the following extract from a note written by Mr. D. H. Fitzhugh, Jr., to Mr. Fred Mather anent the latter's article in "Fishing With the Fly. Mr. Fitzhugh writes:

"I have just been reading your article on grayling fishing in 'Fishing With the Fly.' You have made a very grave error, which should be corrected in some manner. You assert boldly that the grayling never leaps from the water in taking the fly. As you were with me on all the fishing trips for grayling which you ever had, and on these occasions we were after the fish in the spawning season for the purpose of getting eggs for propagation, and it was particularly the depth of winter. You are right as far as your experience goes; they do take the fly just as you say, at or below the surface. But take the grayling at the proper season, and it is as 'leapin'' a fish as a trout. On several occasions I have lost the tail-fly or stretcher, and with nothing on the line but the hand-fly, have trailed it some inches above the water, when the fish were rising, to see them leap and take it, and have caught many in that way, hooked six inches in mid air. Moreover I have never seen a trout leave the water in his struggles after being hooked, over two or three times, while I have seen the grayling leap six times for all he was worth. I hope to have you with me on the old streams."

Fishculture.

THE MENHADEN QUESTION.

Editor Forest and Stream:

The communication from Mr. Daniel F. Church, in your issue of Jan. 24, on the menhaden, and the great quantity of fish existing at the present time, stirs the antagonistic element of my constitution into making a few remarks:

Mr. Church claims that fish are as plenty as formerly, and cites dates and years to sustain his assertion. To rebut his mistaken statement we refer to all the hook and line fishermen in Newport, R. I., or of Narragansett Bay, or extending south to Sandy Hook, or east to Cape Cod, to sustain us in the assertion that he is as far from correct as the sun is distant from the earth. We also refer to Caleb Haley & Co., H. N. Rogers and Moon & Lamphere, all of Fulton Market, New York, all of whom will testify to the constant diminution of fish on our coast since the introduction of pounds, or heart seines, and steamer fishing, as carried on to the enormous extent it is at the present date.

To cite one instance that comes under our own personal notice, Mr. Wm. M. Rogers, of South Portsmouth, R. I., who was engaged in the fish business from 1830 to 1860, and is a member of the firm of M. Rogers & Co., of Fulton Market, N. Y. In 1854 he bought of the trap and seine fishermen of the Seaconet River, 1,200 barrels of large green head sea bass, scup, and other edible fish, delivered on the shore, for sixteen cents per barrel to spread on his farm for manure. He further informs us that at or about this time he bought for the market sea bass by the sugar box for $1.50 per box. Now we ask for an instance in the past few years, when these fish could have been bought for any such prices, or anything approaching them? A greater part of the time they have been nearer sixteen cents per pound than sixteen cents per barrel. When has there been such a quantity of fish caught by hook and line as there was prior to the introduction of the pounds and steamer fishing? Since the wholesale slaughter by these agents began, there has been a constant diminution in all kinds of fish, until the hook and the net fishermen do not find enough fish to meet their expenses, in many instances. Again we refer to the wholesale dealers of New York and Philadelphia for proof of the limited quantity of late years compared with what there was in the year mentioned.

I claim, as well as every other fisherman who has not got his capital in steamers, seines and pounds, that there is, has been, and furthermore will be, a gradual decline in all kinds of fish, which can be traced directly from the above causes, viz., steamers, semes and pounds. Unless a law be passed by the United States Government, to prohibit these destructive agents from plying their vocation within three miles of the shore, thus giving the migratory fish a chance to follow the old-time habit of leading the shore, this depletion will continue.

To explain somewhat one of my theories, I will make use of a simple illustration: If we were accustomed to walk each morning in a beautiful park without molestation, and upon going some morning, should find at the entrance two men, each armed with a club, a third man just back of these two, and the three were bound to have a clip at us as we entered and returned, we would soon shun that place as we would the plague. Just so with the fish. The two men are represented by the pounds on each side of our rivers, the third man is the steamer, waiting for the fish in the spring, when they arrive, and they not only get one or two clips, but they pound and harass them, from the time of arrival to their departure in the fall. Is it a wonder they grow scarce? No! The only wonder, to my mind, is that there are so many left, after being constantly caught and driven off.

Mr. Church says the striped bass might feed on the menhaden. They would, undoubtedly, if they found them on the grounds they were accustomed to feed. But they have been driven from these grounds. In 1883 you could not get a menhaden for love or money, in this locality, fresh enough to use for bait. What was the consequence? Less striped bass were caught than any time in the recollection of fishermen for the past thirty years. He speaks of bass not being caught in purse seines. Why? Because they require depth of water to make their sets. It is a well-known habit of the bass to follow, or lead, the shores; and if purse net fishermen could set their seines, or had cause to, in shoal water, they would catch bass; for they are destroyed by the barrel by the pounds, and are first caught in them on their appearance in the spring, and well up Narragansett Bay at that. We know of two being caught the past season that weighed over fifty pounds each, and they were caught three miles up the bay. These are facts which will disturb the statement that they are located outside of the bay. We have followed bass fishing for pleasure more or less for the past seventeen years, and for the past three years as a business. And have caught and cleaned bass that have had parts and whole menhaden in them, full-grown fish. One in particular of fifty-six pounds weight, had no less than parts of nine full-grown menhaden, and I contend that they do and will feed on them when they can. Mr. Church speaks of a glut, and dealers refusing, or saying "Snip as few fish as possible." The cause of this glut was from the reason of sudden catches of large schools of fish in pounds and seines, and all shipped in one day, and that without ice, the fish then glutting the market in a decaying state caused by lack of knowledge in packing them.

I could cite cause and instance after instance in this connection, but will not try your patience or weary your readers further than to say that it is time that more attention is given to the diminution of fish by steam fishing gangs, pounds and seines. I heartily wish there could be interest enough aroused among the disciples of the hook to inaugurate a movement that would in time suppress the above causes of wholesale destruction of our fish. If no such move is made it will soon be a thing of the past to catch with the hook one of those noblest of game fish, the striped bass. We shall not only be deprived of our sport, but what is far more important, we shall be deprived of all kinds of salt water fish as a staple food, and in a short time they will only be found on our tables as an article of luxury. To close this humble effort to express the ideas of a fisherman against the monopoly by capital, we would say that we fully agree with your correspondent, "Fisherman," in his opinions advanced in your issue of Jan. 10, and would also say if we cannot arouse interest enough to secure a law to protect the fishing interest, let us have the appropriation he speaks of.

We also respectfully ask the United States Fish Commission to investigate this matter fully, not from our standpoint alone, but let them take both sides of the question, and they will soon discover that there is urgent need of the protection, as well as the propagation of our salt water fish. W. M. H.

SOUTH PORTSMOUTH, R. I., Jan. 31, 1884.

STOCKING STREAMS WITH TROUT.

THE following on this subject is taken from the last report of the Fish Commission of Connecticut, and shows the working of stocking private waters by the State:

Very great interest has been manifested in the efforts of your Commissioners to stock the depleted brooks and streams of the State with trout. Though the supply was greater than in any preceding year, the demand last year was so great, that only 3,000 could be allotted to each applicant. All those who applied previous to March 1 received their quota. It is very gratifying to receive such favorable reports from the streams stocked during the two previous years. The young trout are thriving, and in many cases reports come to your Commissioners of their reappearance in streams where none had been seen for several years. The prospect seems good for a return of their former abundance, especially as the farmers are making efforts to protect them during their infancy. Occasionally some one complains that he is not allowed to capture the fingerlings as usual. As a specimen, a clipping from a Hartford letter to the Springfield *Republican* is here given:

"They go out for trout, and the number of large catches of trout reported this year is well above the average. The explanation is simple. Many people have taken advantage of the offer of recent years of the Fish Commissioners to give 5,000 young trout to whoever would come and get them. With these they have stocked wild brooks and then they have hired from the land-owning farmers the sole right to fish in the streams. In other words, we are developing a lot of preserves. It is impossible to see the harm of it. Fish are bigger and plentier, farmers get a little something for what they used to get nothing for; their fences are safer and crops less disturbed. And yet it is said that the effect of these preserves, with the warning notice against fishing, has been to create a hostile feeling against the Fish Commissioners. People will go to fish in a brook and find it preserved, say it is all due to the Fish Commissioners, and get mad accordingly. But these same people do not think of going to the farmer's barn-yard for chickens and then condemning the Legislature at the thought that they can't carry off the broilers without being punished."

The facts, so far as reported, are that the farmers, finding that certain persons were in the habit of visiting the recently stocked brooks, and catching the young trout deposited only the previous year, have posted their lands for the purpose of giving the young trout a chance to grow to a sufficient size to propagate their species. In this way alone can the experiment receive a fair trial, for there is in every State a class of persons, generally known as poachers or pot-hunters, whose only idea is to capture the last bird or the last fish possible, provided only it serves to supply by its sale, their craving for whiskey. The March woodcock, the July partridge, and the yearling trout are all equally welcome, if they can be sold, and it is well known that even in Hartford woodcock have been served at dinner parties in May and partridges in August, and trout can be bought at any season. The young trout for the year's distribution were provided by Mr. Henry J. Fenton of Poquonock, at a cost to the State of three dollars per thousand. Mr. Fenton's system of delivery has been so perfect that no complaints have yet reached your Commissioners from any quarter.

In their report of last year your Commissioners recommended that an Act should be passed forbidding the exposure for sale of any trout less than six inches in length. A bill for the purpose was presented to the General Assembly, referred to the Committee on Fisheries, acted upon without the knowledge of the Commissioners, reported adversely, and promptly defeated. As complaints are frequently made to your Commissioners about the sale of fingerling trout in the markets, the subject is suggested for a reconsideration.

THE MASSACHUSETTS COMMISSION.—Mr. Edward H. Lathrop has been appointed a Commissioner of Fisheries in the place of Mr. Asa French, resigned. Mr. Lathrop has been long and favorably known as a sportsman, and one interested in fishculture. His address is 419 Main street, Springfield. The appointment by the Governor was confirmed by the Council on Wednesday, Jan. 30, and is for the term of five years from February 1.

There died recently at Fort William, Invernessshire, William Mackenzie, one of the most noted deerstalkers of his day. Mackenzie, or as he was more commonly called in his latter days "Old Gaick," was born in the Braes of Lochaber in 1800, and he was thus in his eighty-fourth year. When quite a young man he entered the service of the Ballindalloch family, and soon became their head man in the forest of Gaick, in Badenoch. This situation he occupied for about thirty years. Whoever might be tenant to the forest, William Mackenzie was always head-keeper; and there he became widely known in the sporting world as one of the best deerstalkers of his day. His powers for running and walking were marvellous, and even when in his eighty-third or fourth year he thought nothing of walking twenty or thirty miles in a day. Among the sportsmen who were tenants of Gaick in his time were Sir Joseph Radcliffe, and the Earl of Selkirk. After being thirty years in Gaick he quitted the service of the Ballindalloch family; and at that time Sir Joseph Radcliffe, in recognition of his excellent services while he was tenant of Gaick, conferred on the deerstalker-bard a pension for life. Sir Joseph is long since dead, but Mackenzie's annuity continued to be paid from the estate. During the last twenty-five years he lived here and there among members of his family in different parts of the country. He was literally a mine of Highland tradition and Gaelic song.

LANDOR, the poet, says in one of his sweet little sonnets: "We are what suns, and winds, and waters make us;" but unfortunately suns will scorch, winds will roughen, and waters will not remove the injurious effects of the other two upon the lovely complexion of the fairer sex. For ages chemists have tried to distil from herbs and minerals an elixir of beauty, but they have failed, and it was left to modern times to find a cosmetic which should remove every speck and blemish, and leave a soft and peerless loveliness upon the roughest skin. Gouraud's Oriental Cream does this, and while so perfectly harmless that spring water is not more so, it has a magic influence upon the complexion which cannot be over estimated or believed until realized. To our lady readers we simply say, would you be as lovely as kindly Nature intended? Then use the Oriental Cream. Also from the noted star actress: "Philadelphia, Nov. 22, 1883. I cordially recommend Dr. T. Felix Gouraud's 'Oriental Cream Magical Beautifier,' as it is perfectly harmless. Sincerely, LILLIE HINTON."—*Adv.*

The Kennel.

FIXTURES.

BENCH SHOWS.

March 4, 5, 6 and 7.—Cincinnati Bench Show, Melodian Hall. Entries close Feb. 25. Charles Lincoln, Superintendent, care of B. Kittredge & Co., Cincinnati, Ohio.

March 12, 13 and 14.—New Haven Kennel Club's First Annual Bench Show, Second Regiment Armory. Edward S. Porter, Secretary, Box 657 New Haven, Conn. Entries close March 1.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. C. Greville Harston, Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **869**. Volume I., bound in cloth, sent postpaid, $1.50.

THE BEAGLE CLUB.

AT the request of the committee of the American-English Beagle Club, we have taken charge of the ballot for officers of the club, who have been chosen as follows:

For President,
MR. W. H. ASHBURNER, Philadelphia, Pa.
For Secretary and Treasurer,
MR. A. C. KRUEGER, Wrightsville, Pa.
For Executive Committee,
GEN. F. A. BOND, Jessup, Md.
MR. J. N. DODGE, Detroit, Mich.
DR. J. W. DOWNEY, New Market, Md.

CLEVELAND DOG SHOW.

Editor Forest and Stream:

If the number of letters that I am receiving every day from all parts of the country, asking for premium lists, is indicative of the number of entries we will have, our second bench show will be one of the largest exhibitions ever held west of New York. The premium list is now in the hands of the printer; soon as issued they will be well distributed among sportsmen. We shall hold our show Thursday, Friday and Saturday, April 3, 4 and 5, at Roller Rink, Euclid avenue, same building that we had for our first exhibition. It is well suited for the purpose. We decided to try the three-days plan at the request of many exhibitors, who claim that four days is too long to confine the dogs. The Malcolm standard will be used for judging the black and tan setter. C. M. MUNHALL, Sec'y.

CLEVELAND, Ohio, Feb. 3, 1884.

ON THE SCENT.

SATURDAY morning, the 26th of January, dawned clear and cold, and there being a good tracking snow, it gave me the fever for a fox hunt. Having no hound of my own, I hied me to a neighbor's and borrowed his dog, and off I started. Climbing a hill off to the southwest of my home I work along on its top for quite a distance without finding a sign of a track. I saw quite a large flock of crows, though, that had evidently been fooled by the weather "prognosticators" prophesying an open winter, and had stayed around, and are seemingly having a pretty hard time to get a living. Going to the trees where they had been, I found the snow plentifully besprinkled with beechnut burrs, which they had shook off in some way, and then had thoroughly examined, to get what few nuts remained in them.

I finally gave up trying to find a fox on that hill, and struck across on to a hill in the direction of home. Here Range soon found a track, but it was pretty cold, and he would not "open" on it. He followed it, however, across on to another hill, around its various crooks and turns, most of the time in sight, till he worked it up to a rocky point when I lost sight of him for a moment, but the next instant my blood was sent dancing through my veins by his giving tongue in such a stream of joyous yelps that told me at once he had bounced Mr. Fox. And then out in sight they came, the fox only a short distance ahead. He knew his fleetness of foot, however, and only ran as fast as it was necessary. He ran on the walls most of the time, once going entirely around a lot of about four acres on the wall, with the exception of cutting off the corners a short distance, as he evidently knew the dog would cut across and gain considerably on him if he followed the fence clear around. As he had no trouble to keep out of the way, I soon saw that he would not cross to the hill where I was, so concluded that I better get over there as soon as possible and have a hand in the fun myself. So away I went, going into the snow up to my knees occasionally, but with that "music" lending its impulse to "get there."

I soon reached a wall where I could command a view of the situation. Soon the music began to come nearer, and then I saw that the fox was going to run on a wall to the right of me; so, bending over so as not to be seen, I gain the stand, and with gun at "ready," wait till he gets as near as I care anything about having him, and at once open fire. At the first discharge he goes off from the wall out of sight; but I don't know as he is "done for," so run down close to the wall, and there he was going like a red streak, but I at once give him the other barrel, which sent him headlong into the snow, where he scrabbled around for a moment and then jumped up and away he went up the hill. I promptly tucked a shell into one barrel and spoke to him again; but he didn't mind it, and no wonder, for when I went to see where the shot struck I could not find any marks in the snow. Now, either that shell didn't have any shot in it, or else I tried to be sure and head him off, and so sent them clear to the top of the hill. My second shot made him bleed pretty freely, though, for a while. He had fooled around there as long as he proposed to, however, and so led way on to "hills and valleys new"—to me. I followed on after, hoping that he would turn and come back, but as there seemed to be no prospect of it, I finally started for home to load up some more shells—and my stomach. The dog did not come home till the next afternoon. The snow was nineteen inches deep that day in the woods, where it had not drifted any. O. FAY.

FRANKLIN, N. Y., Jan. 30, 1884.

PHOTOGRAPHS.—We have received from Mr. G. Mills, of Hudson, N. Y., two photographs of the red Irish setter dogs, Guess and Snap (litter brothers), bred by him, and the winners of nine prizes before they were two years old in New York, Washington and Cleveland. The pictures are excellent photographs, and do credit to both dogs and artist.

MR. THOS. G. DAVEY'S BLACK AND WHITE ENGLISH SETTER DOG "PRINCE PHŒBUS."
Winner of very high com. reserve, London, Ont., 1883.

PRINCE PHŒBUS.

WE give this week a cut of the black and white English setter dog Prince Phœbus, owned by Mr. T. G. Davey, London, Ont. Prince Phœbus was whelped April 2, 1880. He is by Tam o' Shanter (E.K.C.S.B. 6,118) and out of Pruo (E.K.C.S.B. 5,774). He was imported by Mr. Davey last September from the kennel of Mr. T. R. H. Dalrymple, Stranraer, Eng. He was exhibited a month later at the London show, where he won very highly commended reserve, in the open class for English setter dogs, and the special for the best English setter dog owned in London. He is quite a good looking dog with an evenly marked head, good chest, body, loin and quarters. His stifles are well bent and he has the appearance of being a speedy, useful animal.

THE CLUMBER SPANIEL.

But if the shady woods my cares employ,
In quest of feathered game my spaniels beat,
Puzzling the entangled copse, and from the brake
Push forth the whirring pheasant.

THE Clumber spaniel is a thorough gentleman's dog, a regular aristocrat, and ought, to be seen in perfection, to be worked in a large team, and such as only a rich man can afford to keep; and well bred and broken, and shot to in covert suitable to such dogs, it is certainly a great treat to a sportsman.

A Clumber or two, from their slow gait and large size, are of little use in an ordinary way, and for general work are not much to be recommended. At the same time, there is no doubt it is the scarcest, the choicest, and the most valuable breed of spaniels we have.

The first mention I can find of them by the name of Clumber is in an article in the old *Sporting Magazine*, which also gives an engraving by a well-known man of his day, Bartolozzi, of a team of dogs belonging to his Grace, the Duke of Newcastle, and their keeper, Mansell, with a woodcock in his hands. They were said to have been imported from France, and were given to the Duke by the Duke de Noailles (it does not appear at all clear when these dogs were imported from France, but if, as is supposed, this breed of dogs all sprung from the Duke's kennel, they must have been there for a number of years, as it will appear presently that Lord Westmoreland had them a century and a half ago); and it is from their having been, as is believed, first bred at Clumber Park, the Duke of Newcastle's seat in Nottinghamshire, and have ever since been largely bred until the last few years, and carefully treasured and preserved there, that they take their name. For a great many years the Duke of Newcastle was very chary of the breed, and consequently they got into very few hands; but I believe at a sale some years ago they were nearly all sold. The family of Mansell have been keepers to the successive dukes for a great many years, and paid great attention to this breed of spaniels.

Although I cannot prove it, I have a very great idea that this, after all, is an original English breed, and that they were exported from England, it may be centuries ago. In one of the very earliest books written on this dog I find it stated in these words: "The French dogs are derived or propagated of the dogs of Great Britain." And in another place, "The Spanish dogs whom the French call Espagneuls have long ears, but not like branches (meaning hounds), and by their noses hunt both hares and conies. They are not rough, but smooth-coated." I take it that by smooth coats the author did not mean to imply that they were smoooth-coated like a pointer, or, as is now the fashion with our beautiful but useless black spaniels, but flat-coated like a well bred setter.

In another old book the author says: "You must be provided with a good spaniel that will range about well, and when he hath perched the pheasant, to bay soundly, which will cause them to keep the perch the better; then, hearing whereabouts he is, make up to him as privately as possible, and having espied him (being at a reasonable distance), make your shot; and for your dog's encouragemend, let him bring him to you and make much of him." This I should think, did not mean the Clumber spaniel; for one great characteristic of that breed is that it is perfectly mute when on game. One can hardly help smiling at the author's quaint way of writing, it puts one in mind of an American dog "treeing a 'coon."

The following is an extract from an article in the old *Sporting Magazine;* although the writer does not say so, I have no doubt whatever that the spaniels he refers to were Clumbers: "Lord Westmorland used to have a first-rate breed of spaniels fifty years ago, and they had been in the family for upwards of a century, and they were extremely choice of the blood and each under-keeper had six or seven brace under his particular care, as well as some particular wood or portion of the forest, which contained 20,000 acres, of which 8,000 were wood. A gentleman who shot over them in 1835, says: 'Renshaw's are allowed to be the crack spaniels of the establishment, and fine fellows they looked as they met my eye that morning. I fancy myself to be a judge of a spaniel, and these appeared what spaniels should be: all of a color, lemon and white, short-legged, thick-backed, and ears not too long or curly, which may suit the parlor, but agrees very ill with briars or burrs. I never saw dogs in better working condition, nor spaniels under finer command when we went to work with them. Practice had indeed made them perfect; they had just enough chase about them to drive a hare or rabbit across the line of guns; but, at the same time, they kept so well within range, and packed so admirably, that I scarcely saw a pheasant spring out of shot during the day.' This is one of the charms of shooting to Clumbers; when once well broken they are perfectly steady and give no trouble. Although a busy and a steady worker, he seems to consider that when he has put up the game his duty is accomplished, and he has no wish to run open-mouthed after his game like we see in all old paintings and engravings of spaniels at work: they are all represented in close proximity to the game, apparently all anxiety to catch it."

The late Lord Middleton, of Wollaton Hall, Notts, had at one time a first-rate breed of spaniels, which he brought to the highest perfection. "Nimrod," in an article on pheasant shooting, mentions these, and also some belonging to Mr. Giffard, of Chillington Hall, Staffordshire, which he says were the only ones he ever saw fit to be taken out with highly broken pointers; when in cover the spaniels found the game and the pointers came to heel, in the open the pointers ranged and the spaniels came to heel with one crack of the whip; one of the spaniels would back the pointers if allowed to do so, which must be considered a very rare accomplishment indeed, and one not very easily acquired. These spaniels I believe to have been Clumbers; I don't know whether "Nimrod" knew as much about shooting as he did of hunting, but he was a thorough sportsman, and no doubt understood what he was writing about.

Morland, the celebrated animal painter, has many paintings and sketches of spaniels, always in a quiet, steady attitude, and nearly all of them are, if not really Clumbers, at all events very much of that character, and I do not think that for many years the breed was so exclusively confined to the Duke of Newcastle's kennels as many people suppose; the Duke, no doubt, jealously kept his own strain from getting common, but I have strong grounds for believing the Clumber to have been originally sent from this country to France and re-imported there. The Duke's strain, which was given to him by the Duke de Noailles, was in all probability derived from English stock.

I firmly believe the Clumber spaniel to be one of our early and original breeds of dogs, frequent mention being made by old writers of orange or lemon and white spaniels.

Lord Westmorland's dogs, therefore, as well as several others, may not have been related to the Duke of Newcastle's strain at all, and will account for the great difference in head and other points in the several breeds at this time, notably in the late Prince Consort's and the Earl of Arundel's kennels at Wardour Castle.

In the early days of dog shows Mr. R. Boaler showed some very fine dogs; but to my thinking they were hardly heavy enough, had a little too much daylight under them, and, though not wanting in true Clumber character, were not equal to the Duke of Newcastle or Mr. Holford's strains.

Nevertheless, as I have said, they were very fine dogs; he had bred them carefully for many years, and I know them to have been good dogs in the field. Mr. Boaler was, I believe, keeper to the Duke of Portland, and if so, probably they were really his dogs. The next to show Clumbers was Mr. R. Stayner Holford, M. P., of Westor Birt, who carried all before him when he consented to exhibit them. A team of his spaniels was exhibited on one occasion at Islington, and created a great sensation. They were justly and greatly admired, and were at one time, if not so now, the largest and best kennel of Clumber spaniels in the kingdom. Mr. Holford won all six prizes at Birmingham in 1862, with, as "Stonehenge" says, "such a team as in all probability were never put together before." I have never seen better Clumbers anywhere than Mr. Holford's, and his dogs, Kimbush, Rover and Brush, and bitches, Truce, Venus and Silk, have never been, in my opinion, equalled, not to say excelled, as a team.

I have seen as many as fifty couples in his kennel at one time, every one worth a Jew's eye. Mr. Holford spared no expense or trouble in obtaining the best blood, and he was ably seconded by Garland, his head keeper, than whom no man in England understood better what a Clumber spaniel really is. Garland went every year on a visit to the best kennels, to see if he could pick up anything to improve his own; and if he found it, no price stood in the way. I have shot to over twenty couples at once on several occasions, and their work was certainly as near perfection as regards covert-shooting to spaniels as it is possible to attain. They were usually hunted by the head keeper with a queer-looking fellow called

'George," who, however, knew his duties as whipper-in Every dog worked within about twenty-five to thirty yards of the gun, every one dropped to shot, was free from chase and quite mute; a "whimper" would have been followed by the immediate order for execution. It certainly was a treat to a sportsman, not to be met with every day. The way they spread out like a fan, with their noses on the ground, and the busy, merry working of their sterns, their fine brilliant coats flashing among the bushes, working to the keeper's hand, being certainly very beautiful. Nothing could escape them; every bush that could hold anything as big as a linnet was searched, and every dock leaf or bunch of nettles closely examined by their noses; nothing could be better than the whole turn-out—it was perfectly unique.

Garland particularly fancied the strains of Mr. Foljambe, Lord Spencer, and the Duke of Newcastle. It is some years since I saw this kennel, and I do not know whether or not it is now kept up to its old strength and form; but I fancy, since the death of old Garland, Mr. Holford has lost the hand and head most effective in keeping the team up to its proper standard.

The Duke of Portland has a grand team of Clumbers, and has won many prizes with them, and I believe they are quite A 1 in the field, and at this time probably the finest kennel in the kingdom. They are not often exhibited, but when they are they are tolerably sure to be at the top of the list.

The Duke of Hamilton has also a very beautiful strain of Clumbers, which are held in deservedly high estimation and which are pretty sure to be in the prize list whenever shown.

His Royal Highness the late Prince Consort had a team of Clumbers, but from what I have seen of his blood, though I never saw them in kennel, I don't think he had quite the right sort, that is to say, of the type I have been discussing, but that they were of pure blood, I do not doubt; they were too pointed and long in the head, and not heavy enough in bone; beautifully feathered and with good coats, but in some specimens which I have met with there was decidedly something which wasnot, according to general notions, quite correct.

The Maharajah Dhuleep Singh had also a breed of Clumbers, and a story is told that after Prince Albert's death a present of a brace of puppies which the Prince had promised him from a very beautiful litter were forwarded to him by command of Her Majesty the Queen, as appears by a paragraph in memoriam of the Prince which appeared in the *Sporting Magazine* of that date:

"The Prince participated in our gracious sovereign's fondness for dogs, and the following anecdote of a circumstance which has only within the last few days occurred will, we are sure, be most acceptable and pleasing to our readers. Shortly since Prince Albert promised the Maharajah Dhuleep Singh that he would present him with a couple of puppies from the litter of a beautiful Clumber spaniel. The Prince's lamented death briefly followed. To the surprise and great gratification of the Maharajah, he has received a letter, written to him by command of Her Majesty, informing him that the Prince's gift awaits his Highness—the puppies promised by the Consort are ready for him. Can any comment from our pen requisite on such an incident! Plans, promises and wishes—even to the very thoughts of the departed—all, aye, every one stored and ready for application."

[TO BE CONCLUDED.]

NEW HAVEN DOG SHOW.—The entries for the New Haven bench show close March 1. As the winners will be eligible to compete in the champion classes at the show of the Westminster Kennel Club in May, there will undoubtedly be many fine dogs present.

THE CRYSTAL PALACE DOG SHOW.—The report of the Crystal Palace show from our regular correspondent arrived too late for this issue. It will appear next week.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Lady Leicester. By Mr. John A. Doolittle, New Haven, Ct., for orange and white English setter bitch, whelped Nov. 8, 1883, by Blue Blood (Leicester—Doll), out of Coin (France—Fanny).

Rye. By Mr. Geo. Laick, North Tarrytown, N. Y., for white, black and tan mottled beagle bitch, whelped Sept. 17, 1883, by Ringwood out of Roxy.

Meggie. By Mr. John W. Trautum, Middletown, Ct., for red Irish setter bitch, whelped July 21, 1883, by champion Elcho out of Meg (Elcho—Rose).

Miss Ranger. By Mr. W. F. Gould, Menomonee, Wis., for liver and white pointer bitch, whelped Nov. 3, 1883 (Dilley's Ranger—White Lilly).

Bracc Ranger, Dine Ranger and Lass o' Ranger. By Mr. S. B. Dilley, Rosendale, Wis., for pointers, two dogs and one bitch, whelped Nov. 3, 1883, by his Ranger out of his White Lilly.

Mona. By Mr. F. Pendergast, Boston, Mass., for red Irish setter bitch, by Dr. Wm. Jarvis's champion Elcho out of Meg.

Essex and Bernardo. By the Essex Kennel, Andover, Mass., for tawny, brindle and white smooth-coated St. Bernard dogs, whelped Jan. 30, 1884, by Alp II. (A.K.R. 705) out of Daphne II. (A.K.R. 489).

Avis, Alpina, Lotta and Quenn. By the Essex Kennel, Andover, Mass., for white, with orange tawny markings, smooth-coated St. Bernard bitches, whelped Jan. 30, 1884, by Alp II. (A.K.R. 705) out of Daphne II. (A.K.R. 489).

Rose Marie and Red Kate. By Capt. F. G. Bixby, Boston, Mass., for red Irish setter bitches, whelped June 17, 1883, by his Ruby (Elcho—Rose) out of Red Maggie (Chief—Gussie).

Dash Boy and Duck. By Capt. F.G. Bixby, Boston, Mass., for black, white and ticked English setters, dog and bitch, whelped Oct. 19, 1883, by Dash III. out of Rhœbe (Rook—Dora).

Black Bess II. By Mr. Louis Melchor, Battle Creek, Mich., for black coeker spaniel bitch, whelped Aug. 28, 1883, by imported Tippo out of Woodstock Queen (Beau—Black Bess).

Blue Belle. By Mr. Louis Melchor, Battle Creek, Mich., for blue belton English setter bitch, whelped Aug. 28, 1883, by Count Noble out of Rosalind (Leicester—Sanborn's Nellie).

Jolly Nell. By Mr. H. W. Durgin, Bangor, Me., for white, black and tan English setter bitch, by Mr. J. H. Goodsell's Prince out of Jolly May.

Jolly June. By Mr. H. W. Durgin, Bangor, Me., for black and white English setter bitch, by Mr. Jas. H. Goodsell's Prince out of Jolly May.

Marvel. By Mr. J. W. Munson, St. Louis, Mo., for liver and white pointer bitch, whelped Feb. 22, 1882, by Croxteth out of Trinket (Tory—Jaunty).

Master M. By Mr. J.W. Munson, St. Louis, Mo., for liver and white pointer dog, whelped June, 1883, by Croxteth out of Spinaway (Garnet—Keswick).

Mack M. and Majesty. By Mr. J. W. Munson, St. Louis, Mo., for liver and white and lemon and white pointer dogs, whelped October, 1883, by Faust out of Musette.

Bessie Case. By Mr. J. W. Munson, St. Louis, Mo., for black, white and tan English setter bitch, whelped December, 1881, by Fritz (Roderick—Norna) out of Duff (Carlowitz—Rose).

Dimple Baker. By Mr. J. W. Munson, St. Louis, Mo., for black, white and tan English setter bitch, whelped April, 1880, by Sanborn's Dan out of Sanborn's Roxey.

Jule. By Mr. James L. Semon, New York, for lemon and white English setter bitch, whelped April 10, 1883, by Dr. S. Fleet Speir's St. Elmo IV. (champion St. Elmo—Clio) out of Diamond Duchess (Bailey's Victor—Blue Nellie).

Beaumont. By Mr. W. W. Nixon, Leesburg, Va., for liver and white ticked pointer dog, whelped June 19, 1883, by Beaufort (A.K.R. 694) out of Fannie Turner (Sensation—Queen II.).

NAMES CHANGED.

☞ *See instructions at head of this column.*

Belgrave Bess. Mr. H. P. McKean, Jr.'s (Philadelphia, Pa.) imported fox-terrier bitch Belgrave Bess (Akely Joe—Hebe), Jan. 8, three dogs.

Rita Croxteth. Mr. Geo. S. Tucker's (Peterborough, N. H.) pointer bitch Rita Croxteth (A.K.R. 168), Dec. 22, six (three dogs), by his Baronet (A.K.R. 264).

Bess. Mr. F. Waterman's (Hudson, N. Y.) red Irish setter bitch Bess (Chief—Hill's Tilley), Jan. 21, ten, all bitches, by Mr. Wm. H. Pierce's Glencho (Elcho—Noreen).

Nina. Mr. Arthur Brookhouse's (Wellington, Mass.) English setter bitch Nina (Lelaps—Belle), Nov. 8, nine (seven dogs), by Mr. A. M. Tucker's Dash III.

Kelp. The Detroit Kennel Club's (Detroit, Mich.) English setter bitch Kelp (A.K.R. 110), Dec. 29, eleven (seven dogs), by their Nixey (A.K.R. 177).

Chess. The Detroit Kennel Club's pointer bitch Chess (A.K.R. 77), Dec. 25, twelve (six dogs), by their King Bow (A.K.R. 83). Seven since dead.

Ruby. Dr. S. H. Green's (Newmarket, N. H.) liver spaniel bitch Ruby, Dec. 19, ten (six dogs), by Mr. J. P. Willey's Obo II. (A.K.R. 432). Eight black and two liver.

Betty. Mr. Wm. B. Mersnon's (East Saginaw, Mich.) Gordon setter bitch Betty, Dec. 17, seventeen (eleven dogs) by Dick (Rupert———). Betty threw thirteen last spring and her owner was very much elated thereat.

Madge. Capt. F. G. Bixby's (Boston, Mass.) red Irish setter bitch Madge (Berkley—Ruby), Jan. 21, eight (four dogs), by his Ruby (Elcho—Rose).

Trix. Glencho Kennel's (Peekskill, N.Y.) red Irish setter bitch Trix (A.K.R. 187), Jan. 27, eleven (six dogs), by their Glencho (Elcho—Noreen). None for sale.

Ace of Spades. Mr. George H. Gilbert's (Boston, Mass.) black spaniel bitch Ace of Spades, Jan. 28, eight (five dogs), by Obo II. (A.K.R. 432).

SALES.

☞ *See instructions at head of this column.*

Miter. English terrier dog, whelped Sept. 7, 1883 (Dandy—Fanny), by Miss Ida F. Warren, Leicester, Mass., to Dr. Geo. O. Warner, same place.

Wycliffe. Red Irish setter dog, whelped Aug. 25, 1883 (Ruby—Lyda Belle), by Dr. J. Frank Perry, Boston, Mass., to Miss Ida F. Warren, Leicester, Mass.

Lucretia. Liver, with white on breast, cocker spaniel bitch, whelped May 1, 1883, by Snipe (Captain—Nellie) out of Cute (Sam—Flora), by Mr. Forest W. Forbes, Westboro, Mass., to Mr. Geo. M. Hour, same place.

Primer. Black and white English setter dog, age not given (Dashing Dan—Daisy Starlight), by Mr. C. N. Wade, Hackettstown, N. J., to Mr. Geo. Shaw, Minshell, N. J.

Lady Leicester. Orange and white English setter bitch, whelped Nov. 10, 1883, by Blue Blood (Leicester—Doll) out of Coin (France—Fanny), by Mr. W. E. Miller, Meriden, Ct., to Mr. John A. Doolittle, New Haven, Ct.

Chief—Biddy whelp. Red Irish setter dog, whelped Feb. 2, 1883, by Mr. Geo. Laick, North Tarrytown, N. Y., to Mr. Chas. P. Williams, New York.

Donna. Red Irish setter bitch, whelped Feb. 2, 1883 (Chief—Biddy), by Mr. George Laick, North Tarrytown, N. Y., to Mr. Frederick Comfort, Catskill, N. Y.

Flora. Liver, with white on breast and feet, cocker spaniel bitch, whelped Oct. 20, 1882 (Joe—Beauty), by Mr. Jas. W. Rushforth, Yonkers, N. Y., to Mr. A. D. Wilbur, Catskill, N. Y.

Spry. Lemon and white pointer dog, whelped July 16, 1882, by Quest (Sensation—May) out of Topsy (Ned—Flora), by Mr. J. H. McCann, Colebrook River, Ct., to Mr. J. W. Trantum, Middletown, Ct.

Miss Ranger. Liver and white pointer bitch, whelped Nov. 3, 1883 (Ranger—White Lilly), by Mr. S. B. Dilley, Rosendale, Wis., to Mr. W. F. Gould, Menomonee, Wis.

Black Pearl. Black cocker spaniel bitch (A.K.R. 647), by Mr. Geo. S. Tucker, Peterborough, N. H., to Mr. J. P. Willey, Salmon Falls, N. H.

King Bow—Bow Queen whelp. Pointer bitch, whelped Nov. 14, 1883, by the Detroit Kennel Club, Detroit, Mich., to Mr. Geo. Hoover, Canal Fulton, O.

Crook. Blue belton English setter bitch (A.K.R. 271), by Major G. R. Watkins, Brooklyn, N. Y., to Dr. H. F. Aten, same place.

Flash. Black and white cocker spaniel dog (A.K.R. 652), by Mr. Forest W. Forbes, Westboro, Mass., to Mr. George M. Hour, same place.

Port Wine. Pointer dog, 3 years old (Shot—Taylor), by Mr. J. S. Brown, Montclair, N. J., to Mr. Isaac Eckert, Reading, Pa.

Beaut—Bell Mahone whelps. Black, white and tan English setters, whelped November, 1883, by Mr. J. O. Watts, Lineville, Ia., one to Mr. J. S. Brown, Montclair, N. J., and one to Mr. J. R. Beny, Jr., same place.

Flora. Fawn, with white toes and tip of tail, rough-coated St. Bernard bitch, whelped Oct. 18, 1883 (Carlisie—Moya), by Mr. James McNamee, Stapleton, S. I., N. Y., to Mr. Henry Muller, Clifton, S. I., N. Y.

Jolly Nell and Jolly June. Blue belton English setter bitches, whelped June 25, 1883 (Goodsell's Prince—Jolly May) by Mr. H. G. McMillan, Rock Rapids, Ia., to Mr. H. W. Durgin, Bangor, Me.

Jolly June. Blue belton English setter bitch, whelped June 25, 1883 (Goodsell's Prince—Jolly May), by Mr. H. W. Durgin, Bangor, Me., to Mr. C. F. Danforth, same place.

RIFLES IN THE FIELD.

THE English rifle makers and shooters are indulgiug in flooding the newspapers with letters upon the re-arming of the infantry of the regular forces. One of the more recent and interesting of the series of letters is from J. D. Dougall, the well-known gunmaker, of Bennett street, London, who in the *Times* says:

"For many years references have been made in the public press to the inaccurate shooting of our soldiers on the battlefield. In former times this was attributed to the smoothbore musket, the familiar 'Brown Bess' of our forefathers, and it was a favorite estimate that at the battle of Waterloo there was only one casualty for every hundredweight or so of lead expended in bullets. The rifle system was to remedy all this; but the question now is, has there been such improvement as expected? and I believe that it is a very common opinion that there has not. This disbelief has been greatly strengthened by the result of the affair of some of our best infantry with the Boers in South Africa some year or two ago, when our highly trained and disciplined men had no chance, although armed with the most scientific weapons, against those rough Africanders, all sportsmen from boyhood. In short, our men were picked off one by one, and could deliver no effective fire in return. Why was this? Let me give an answer to this question, not dogmatically, but for the due consideration of all concerned. If my words may appear somewhat dogmatic, it is because they are founded on knowledge and experience.

"It may appear a bold assertion, but I hold all high 'vernier' sights on military rifles, for use in actual battle, to be a mistake. Let them be applid to long-range and target rifles if you will; but target practice will never make a man a good shot in the field, whether he be a soldier or a sportsman—nay, I go further, and say, with all the confidence that is founded on experience, that it will make a bad shot of either. To explain. All good shooting is founded on keeping both eyes open in the act of aiming and firing. It is by this that, unconsciously, we have a sense of distance, and that we also command the ability to aim correctly at objects parly concealed (as the Boers were) or in motion. Soldiers are not taught this, and I have read somewhere that they are even enforced, under strict orders, to close the left eye and take aim. To use one eye only, however effective it may appear at target shooting, is to throw away our natural endowment of binocular vision, and all the fine 'rifle sights' in the world will not restore the loss. This is now being recognized by sportsmen, and hardly a man among them is now to be found who closes his left eye in game shooting. Yet when I first began to ventilate the subject (but by no means claiming that I had invented the 'two-eye' system) in the London press, about the years 1855-56, I was received with a shout of derision. But the derision has passed away, and all the best shots whom I have had the opportunity of consulting tell me that they now never think of closing one eye. This is not done in driving a nail, in playing at cricket or billiards, and why is it done in rifle shooting? Because we have got into a wrong groove and think it is the proper thing to do, not knowing that, as the cookery books say, there is 'another way,' and a better one.

"The subject is too serious to be briefly discussed, and I fear to intrude unduly upon your space. To enter upon the whole question is not beyond my ability; but I should prefer, before doing so, that some experienced military men would give this short letter their consideration. In the first place, I would suggest that military rifles be fitted with plain folding 'leaf sights,' say, for 100, 200, 300 and 400 yards, and without complications. Beyond 400yds. I fearlessly assert that much more deadly fire would be delivered upon a moving or shifting enemy by the judgment and common sense of the soldier, trained to keep both his eyes open and to exercise his faculties, than by the use of fine mechanical adjustments, which (be being taught to depend on them) can only puzzle and bewilder him when there comes the real tug of war. Our grandsires drew a good bow at Hastings,' but I never heard of any bowman, from Robin Hood down to the still existing and highly expert Royal Scots Archers, voluntarily depriving themselves of one-half of the ocular powers granted them by nature."

RANGE AND GALLERY.

BOSTON, Feb. 2.—The regular matches were continued at the range at Walnut Hill to-day. The attendance was large, including several visitors, among whom were Mr. W. D. Palmer of the Merrimac Club, and members of the Press Association. During the morning the weather conditions were excellent, a light south wind prevailing; in the afternoon it increased, but not enough to make good shooting difficult. The results of the different matches are appended:

Combination Match.—Decimal Target.

A C Adams	7	8	9	10	8	6	10	10	10	9—87

Capt. John C. Mallory, of the Civil Engineer Corps, United States Army, now stationed in Boston, has been elected to membership in the Massachusetts Rifle Association. He was a member of the Amateur Club of New York.

At a meeting of the directors of the Massachusetts Rifle Association, held at the office of the secretary, the following committees were chosen for the ensuing year: Executive committee, Messrs. Rockwell, Baker, Fellows, J. A. Frye, Gerrish; membership, Leach, Rockwell, Russell; range, Fellows, Bullard and Hinman; glass ball, Sawyer, Frye, Leach; team, Rabbeth, Russell, Perkins; long range, Hinman, Gerrish, Washburn.

SWISS GUN TRIALS.—The *St. James Gazette* reports progress on the series of trials now going on in Switzerland between the new and old systems of military arms. The trials are not yet concluded. But enough has been done in 1883 to demonstrate pretty clearly the superiority of the Rubin system over that now employed for arming the troops. A report by Colonel Feiss, presented to a military society at Berne, declares that the new arm is superior both in accuracy of aim, power of penetration, and flatness of trajectory to the older weapon patented by Vetterli. Mr. Rubin, who is director of the Federal Laboratory at Thun, reduces the caliber of the barrel by one-tenth of an inch, or even more; that is to say, from 10.4 millimetres to 8.0 and 7.5. The cartridge he uses has a metallic case, and contains a little bullet nearly 1¼ inches in length, inclosed in a covering of galvanized copper, requiring no grease. In order to keep the length of the whole cartridge within reasonable bounds, compressed powder is used, and it is exploded by central-fire action. The initial velocity of the ball is found to be 540 metres for the rifle of 8.0 bore, and 565 for that of 7.5 bore, whereas the Vetterli system gives a velocity of only 403. The penetrative force of the projectile carries it at 10

metres through a plate of zinc more than ¼ inch thick; and at 300 metres it has still a velocity of 305 against 292 of the old bullet. Its accuracy of aim is said to be 33 per cent. greater than the Vetterli, and it makes a pattern on the target up to 2,000 metres, whereas the other cannot be depended upon to do so over 1,600 metres. In the matter of trajectory the Rubin weapon is equally superior. With the Vetterli rifle the ground covered by its range, and called the "dangerous space," is about 360 yards; with the Rubin 8.0 bore it is increased to 460 yards, and with the 7.5 bore to nearly 500 yards. The new rifle has four shallow grooves, equal in width to the space separating them, and these have a twist more than twice as rapid as that of the Vetterli grooves. The next experiments are to be conducted with a view to establishing the relative merits of the Rubin system and that of M. Heller, a professor of Zurich, who has also invented a new small-bore rifle.

JAMESTOWN, N. Y., Feb. 4, 1884.—Club medal shoot of yesterday afternoon, 200yds., Creedmoor target, 10 rounds; wind at 8 o'clock, medium, light, bright.

A. G. HULL, Adjutant, Saratoga Rifle Club.

NATIONAL GUARDSMEN.—A meeting of the National Guard Association of the United States will be held at Cincinnati, O., on Wednesday and Thursday, March 26 and 27. The association held its first meeting in New York, its second in St. Louis, and the last in Philadelphia. The association aims to promote military efficiency throughout the active militia of the United States, and to secure united representation before Congress for such legislation as it may deem necessary for this purpose. The Secretary of War will be requested to honor the proposed meeting at Cincinnati with such a representation from the United States Army as he maydeem expedient. Information as to all subjects which it is proposed to bring before this meeting should be sent to the secretary of the association. —W. L. ALEXANDER, Des Moines, Iowa.

NEWARK, N. J., Jan. 30.—The annual meeting of the Newark Rifle Association was held this evening, at the Frelinghuysen range, 189 Market street. The Secretary's report shows an increase in membership over last year. The Treasurer's report showed a balance on hand of $25.12. The following officers were elected for the ensuing year: President, Alfred Hunt; Vice President, J. K. Walsh; Secretary, A. C. Neumann; Treasurer, C. F. Jackson; Association Scorer, J. E. Pollard; Financial Committee, President, Secretary, Treasurer, J. Huegel and J. Velsor.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

FALL RIVER, Mass.—The Fall River Gun Club held an all day tournament Jan. 11, which was well attended by shooters from Providence, East Providence, Pawtucket, Brockton and other places. It was expected that Mr. W. S. Perry, of Worcester, would shoot a match with Mr. J. A. Negus, of Fall River, for the Massachusetts champion clay-pigeon badge, but owing to sickness Mr. Perry did not appear and the match was postponed. The day was spent in sweepstake shooting with the following results:

First match, 7 glass balls—Wilbur of Brockton and Valentine of Providence divided first, Negus of Fall River and Palmer of Providence second, Braley and Hall of Fall River third.

Second match, 7 clay-pigeons—Sheldon and Bourne of Providence divided first, Luther and Paine of East Providence divided second, Wilbur and Braley third.

Third match, 7 glass balls—Hall first, Wilbur and Valentine second. Palmer third.

Fourth match, 7 clay-pigeons—Paine first, Bradley second, Tinker third.

Fifth match, 7 glass balls—Braley and Palmer first, Wilbur and Luther second, Tinker third.

Sixth match, 7 clay-pigeons—Wilbur first, Luther and Tinker second, Sheldon third.

Seventh match, 5 clay-pigeons—Wilbur and Valentine first, Sheldon and Luther second, Braley third.

Eighth match, 5 clay-pigeons—Sheldon and Luther first, Braley second.

Ninth match, 5 clay-pigeons—Braley first, Sheldon second.

The Fall River Gun Club held a shoot on the 30th, Mr. W. S. Perry, of Worcester, and Mr. J. A. Negus, of Fall River, contesting for the Massachusetts Champion Clay-Pigeon Badge at 50 clay-pigeons each, Mr. Perry winning by a score of 42 against Mr. Negus's 36. A number of sweepstakes were then shot, with the following results:

Badge Match—50 Clay-Pigeons Each.

W S Perry	11110011011111101111111111 / 11111111111111011111101110—43
J A Negus	11101111011011010111011110 / 01011100110110111111111101—36

First match, 7 glass balls—Wilbur and Negus first, Hall and Palmer scond, White third.

Second match, 7 clay-pigeons—Wilbur and White first, Hall second, R. Perry third.

Third match, 7 glass balls—Hall and Wood first, R. Perry second, White third.

Fourth match, 7 clay-pigeons—W. S. Perry and Shepard first, R. Perry and White second, Palmer third.

Fifth match, 7 glass balls—W. S. Perry first, Wilbur and White second, Palmer third.

Sixth match, 7 clay-pigeons—W. S. Perry and G. Barney first, Wilbur and White second, Palmer third.

Seventh match, 7 glass balls—H. C. Braley first, Hall second, White third.

Eighth match, 7 clay-pigeons—Hall first, H. C. Braley second, Wilbur third.

Ninth match, 7 glass balls—Wilbur first, Palmer second, Rounsevelle third.

Tenth match, 7 clay-pigeons—Wilbur first, H. C. Braley second.—T. S. H.

BOSTON GUN CLUB.—Jan. 30.—A large number of trap-shooters occupied the range at Walnut Hill to-day to enjoy their favorite sport. Fourteen events were shot, with the following result:

First event, 5 clay birds.—Severence first, Curtis and Barnard second, De Rochemont third, Eddy fourth.

Second event, 5 glass balls.—Lewis and Sawyer first, De Rochemont, Law and Curtis second, Eddy and Nichols third, Saunders and Field fourth.

Third event, 5 clay birds.—De Rochemont and Field first, Curtis and Dickey second, Law third, Adams fourth.

Fourth event, 3 pairs glass balls.—Tinker and Law first, Nichols second, Curtis third, Lewis and Eddy fourth.

Fifth event, 5 clay birds.—Tinker first, De Rochemont, Draper and Law second, Curtis and Adams third, Shumway fourth.

Sixth event, 5 glass balls.—Decker first, De Rochmont second, Tinker third, Eddy fourth.

Seventh event, 3 pairs clay birds.—Law first, Barnard and Sawyer second, Draper and Decker third, Eddy fourth.

Eighth event, 5 glass balls.—Lewis and De Rochemont first, Nichols and Sawyer second, Sampson third, Short fourth.

Ninth event, 5 clay birds.—De Rochemont, Curtis, Short and Eddy first, Sawyer and Barnard second, Decker and Field third, Saunders and Gove fourth.

Tenth event, 3 pairs glass balls.—Decker first, Law second, Tinker and Curtis third, De Rochemont fourth.

Eleventh event, 5 glass balls.—De Rochemont first, Decker second, Barnard third.

Twelfth event, 7 clay birds.—Field, Sawyer and Sampson first, Decker and Draper second, Barnard third, Law and Eddy fourth.

Thirteenth event, 5 clay birds.—Law, Field and Decker first, Gove and Draper second, De Rochemont third, Eddy fourth.

Fourteenth event, 5 clay birds.—Law and Sampson first, De Rochemont and Decker second, Gove third, Sawyer fourth.

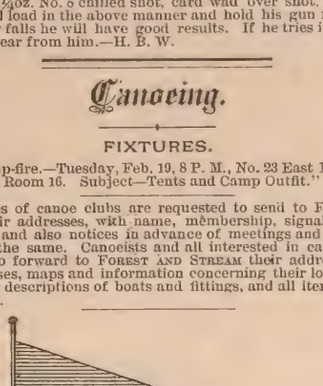
TORONTO, Ontario, Jan. 31.—To-day C. Cockburn, of this city, and George Grant, of Woodstock, shot a match of 25 birds each, 21yds. rise, for $300 a side, at Oulcott's Hotel, Yonge street. There was a large delegation from the city, as the match had excited considerable interest. There was not much betting, and no odds, but at even the Woodstock man had the call, as his townsmen were inclined to support him liberally. Cockburn missed his first bird through neglecting to have his gun cocked, but ultimately won by two birds. The following is the score:

C Cockburn.....0 1 1 1 0 1 1 1 1 1 1 1 0 1 1 1 1 1 0 1 1 1 1 1 0 1 1—19
George Grant.....1 0 1 1 1 0 1 1 1 1 1 1 0 0 1 0 0 1 1 1 1 1 1 1 1 0—17

A second match will be shot at Woodstock during the coming week, also under the Dominion rules.

Subsequently, James Douglas, of this city, and John Forbes, of Woodstock, shot five birds each at $1 a bird. The result was as follows:

James Douglas.....1 1 1 1 1—5
John Forbes.....1 1 1 1 0—4



LOADING FOR CLAY-PIGEONS—Phelps, New York, Feb. 4.—*Editor Forest and Stream:* I use a Lefever hammerless gun, 10-bore, full choked, weight 9½lbs. I always use paper shells. For glass balls I use 4¾dr. of FF Hazard or No. 3 ducking powder, two No. 9 pink edge wads over powder, 1¼oz. No. 9 chilled shot, card wad over shot. For clay-pigeons I use 5dr. No. 3 ducking powder, two pink wads, 1¼oz. No. 5 chilled shot, card wad over shot. If "Clay-Pigeon" will load in the above manner and hold his gun right when the hammer falls he will have good results. If he tries it would be pleased to hear from him.—H. B. W.

Canoeing.

FIXTURES.

Winter Camp-fire.—Tuesday, Feb. 19, 8 P. M., No. 23 East Fourteenth street, Room 16. Subject—Tents and Camp Outfit."

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

IRRAWADDI CANOE CLUB.

DAVENPORT, Iowa.—Organized April 27, 1883. M. C. Smith, Commodore; St. Clair Putnam, Secretary. Eight active members. Signal, blue gronnd with white letters.

NEW YORK C. C.

SEVERAL of the members have been afloat this week. On Wednesday last one of the members in company with a friend visited the club house, and on entering discovered two young men packing up the clothing of the canoeists in rubber bags. Each seized a man, but after a struggle one escaped. The other was taken before Justice Carey and committed for examination. The second man was afterward arrested by officer Hall and identified. The house had been entered through a rear window which was broken open.

Mr. Coudert is having a 14x80 cruising canoe built by Stephens of West Brighton. She will be lug rigged, with light iron board. The Red Rover has been sold to Mr. Wm. Childs, who will fit her with his new centerboard and make a practical test of it on a canoe. It has already been tried successfully on an oyster skiff. The board has been much improved during this winter.

Marmalade Lodge, Staten Island.—On Feb. 3, wind southwest, light, sun shining brightly, McMurray and Cooke, of N. Y. C. C., launched Jersey Blue, and started for a tandem paddle. The heavy ice had gone out with the ebb tide, and the paddlers encountered nothing worse than an occasional floating cake and a thin coating, newly formed, which was easily broken. The trip, though uneventful, proved eminently satisfactory to the participants, judging at least from their later actions.

LARGE vs. SMALL CANOES.

I HAVE just seen for the first time *Outing*, for last October. From the article on the canoe meet at Stony Lake, written by Kirk Munroe, I extract the following:

"In striking contrast to these airy skiffs, floating like egg shells on the very surface of the water, were the big Pearl canoes, exhibited by the members of another Canadian club, the Toronto. They are the largest and heaviest canoes built, and are best fitted for use in the rough waters of the British Isles, where they originated. They carry an immense spread of canvas, have iron centerboards, are heavily ballasted, and partake more of the nature of small yachts than canoes."

The "airy skiffs" he refers to are the open Peterboro canoes. Mr. Munroe then goes on to state that the American crusing canoes offer a happy mean between these two extremes.

From the foregoing, canoeists may infer that Canadian sailing canoes are all Pearls, or small yachts, and that the canoeists in the States would not use such heavy craft. In a late number of your paper a canoeist signing himself "Widgeon" also makes an attack on large canoes. I desire to reply to Mr. Munroe and "Widgeon."

Mr. Munroe has been a member of the New York Canoe Club for some years. Is he aware that the first Pearl built in North America was for Dr. Bronson of the same club? Mr. Oudin, owner of the Pearl Tramp, and Mr. Whitlock, of the No. 3 Pearl Ripple (since destroyed) are also members of that club. The latter craft carried more ballast and had a larger mast and sail area than was ever used on either of the Toronto Pearls. As a striking commentary on Mr. Munroe's remarks, I give a report of a race of the N. Y. C. C. on Sept. 29, just about the time Mr. Munroe must have written his article for *Outing*.

Canoe.	Sail area, feet.	Ballast carried including board, pounds.
Dot	95	75
Freak	105	110
Surge	73	125
Tramp	135	150
Esmeralda	85	60

Won by the Dot.

The Tramp is a Pearl, and the Freak as large as any Pearl. At least she is in class B, as a 16x30 should.

The Pearl and Nautilus models are English, but there are other models used in that country. I do not think I am mistaken in asserting that seventy-five per cent. of the thousands of canoes in use in Great Britain are Rob Roys and similar craft, while Pearls and other heavy ballasted canoes are not five per cent. of the whole.

I do not believe that Mr. Munroe meant to say anything against the Toronto Club, but I suppose he thought that in writing an article for the general public it was not necessary to be very particular. I feel all the more inclined to pardon him, for apparently he has seen the error of his ways and is going in for something larger than Pearls, and which is even outside of the liberal A. C. A. definition of a canoe. I suppose his Alligator will weigh more than a Pearl, heavy board included.

The Cincinnati club use large craft. Dr. Heighway and I think also Commodore Longworth use the Princess model, 15x31 at bottom of top streak. Rushton advertises three sizes of that model—14x31, 15x31 and 15x36; Stephens advertises, and has built, more Pearls than any other builder in America; the Racine Co. advertise double canoes 16x38 and 18x40, weighing 150 and 170 pounds respectively; Joyner, of Glens Falls, 16x36, and so on. And yet with all this I do not think that all future canoes will be large and heavy with iron boards.

"Widgeon" need not fear that all canoeists will wish to be racers, they will never number more than a small percentage of the whole. In all regattas there are always more races for the medium than for the extremes in either paddling or sailing. At Stony Lake a medium canoe, the Snake, entered for five races, and won four. In my Boreas I could only enter in one sailing race. In paddling canoes it is the same; the 28 or 30in. craft has a far better chance for prizes than the 24in. The A. C. A. regatta rules will—no doubt justly—always favor the all-round canoe.

"Widgeon" mentions the Stella Maris as a compromise type. Surely the Jersey Blue, the Ellard or the Lansingburgh models like Mr. W. Wackerhagen's Henrietta, are much more of a compromise than the Stella Maris. The Stella Maris is a Rob Roy with a little sheer, and is nearer the extreme in the way of small size than a compromise.

At the risk of being considered egotistical I give some particulars about my Pearl Boreas as a cruising craft. She is 14×32; board weighs 45lbs.; only one carried; carry no ballast; sails balance lug, mainsail less than 60ft.; dandy, a Racine lateen of 10ft; lines on deck one halliard, one reef line and the two sheets; can reef mainsail to 35ft. in any wind or in any position, running, reaching or closehauled, in five seconds; can shake reef out in one second; the hull weighs 190lbs; centerboard is removable at pleasure. I only weigh 130lbs. and am not as strong as a team of horses, yet I can take the Boreas out and in boathouse without assistance even when board is in.

Let "Widgeon" once use a balance lug simply rigged and I think he will admit it is the safest sail he ever tried. I have used all kinds—leg of mutton, standing lugs, lateens and balance lugs—and I swear by the latter.

"Widgeon" is unfortunate in his reference to the cruise of the Maria Theresa. Mr. Bishop used oars on the greater portion of that trip, and when he afterwards made the journey in comparatively smooth water down the Mississippi he used a sneakbox with oars. Let "Widgeon" read Mr. Bishop's reasons for making the change before he condemns all large canoes.

And now to close, will "Widgeon" come to Grindstone Island next August, and some day when a strong southwester is blowing and a good sea is being kicked up, I shall be happy to try a race with him, three or four miles dead to windward and return, he to paddle and I to sail.

HUGH NEILSON (Canoe Boreas).

CANOE OR SNEAKBOX.

Editor Forest and Stream:

I met a drummer on the Lake Shore train a day or two ago who was loudly arguing with his neighbor in the next seat on the question of the sailing qualities and general cruising efficiency of a sneakbox as compared to the modern canoe. The drummer maintained that upon large rivers and open waters, where portages are unnecessary, the canoe has no right to exist; that the sneakbox, when fitted with centerboard and balance lug sail, is a perfect little yacht, possessing ample cabin accommodations for crew, large stowage space and ballast enough to go to windward in a stiff breeze and sea.

Being interested in boats in general and canoes in particular, I took a seat nearer the pair, and under cover of a newspaper took it all in. The longer the cruise, continued the commercial man, the more marked the superiority of the sneakbox; take your proposed Florida trip via Ohio and Mississippi rivers, for instance. No canoe can be slept in many nights in succession without becoming strained, and consequently leaky, and before you reach Cairo you and the bailing can will be well acquainted. "Dunkirk," yelled the brakeman, and as I made my way to the door I caught the words, "Heavy, clumsy canal boat"—"Oars, too"—evidently from the other fellow.

Now, Mr. Editor, up to last Saturday I had intended to buy a canoe and cruise up the lake to Long Point this coming summer, but at present writing am somewhat undecided as to the proper craft, and would like to ask you in all confidence your opinion on the two questions following: First. Will a canoe compare favorably in sailing qualities with a sneakbox, each having centerboard and balance lug sail? Second. Is a canoe liable to become leaky after a fortnight's cruise, the crew (150 lbs.) sleeping on board every night?

Mr. Bishop, in his "Four Months in a Sneakbox," seems to agree with the drummer when he says: "Light indeed must be the weight and slender and elastic the form of the man who can sleep many nights comfortably in a 70-lb. canoe without injuring it. Cedar canoes, after being subjected to such use for some time, generally become leaky; so to avoid this disaster the canoeist, when threatened with wet weather, is forced to the disagreeable task of troubling some private householder for a shelter, or run the risk of injuring his boat by packing himself away in its narrow, coffin-like quarters and dreaming that he is a sardine, while his restless weight is every moment straining his delicate canoe and visions of future leaks arise to disturb his tranquillity."

My ideal canoe is a Racine Shadow, 23in. beam instead of 28in., built with more crown to deck and a trifle less freeboard, and provided with the pointed cockpit combing now in fashion.

By answering the above questions you will greatly oblige a "prospective canoeist." A. H. A.

[The canoe is superior to the sneakbox for general cruising on open waters, as it is fully equal to the latter in sailing and sea-going qualities; it is much more comfortably propelled, weighs much less, and can be much more easily handled on shore by one man and transported, as is necessary on almost all waters at times. It can be slept in comfortably and without any more danger of leakage than with the sneakbox, if reasonable care is used in placing the boat on a smooth surface and blocking the bilges. Mr. Bishop's remarks, written some years since, certainly do not apply to the canoes in use now, as many of them have records of thousands of miles as cruisers and are still dry. We would advise A. H. A. to try a canoe of 14x30 or 15x31½in., and shall shortly publish the designs of such a cruiser.]

THE LOG BOOK.

V.—DOWN THE MISSISSIPPI.

[*Continued from Oct.* 25, 1883.]

Editor Forest and Stream:

I believe that I promised you from Vicksburg a complete narrative of our trip down the Mississippi to New Orleans when it should be accomplished. I gave the account of the trip from Chicago to St. Louis, so the present one will consist entirely of our experiences canoeing on the Mississippi. We left St. Louis Wednesday, Oct. 17, with a strong head wind, and enjoyed(?) our first attempt at beating to windward.

It was, to say the least, not pleasant, for the wind blowing directly against the strong current, raised waves which for ugliness are unsurpassed. They are short, high rollers, just like the stern wash of a "stern-wheeler," and a boat has no time to recover after diving into one before the following one has washed the deck. Added to this, the river is filled with "eddies" which sometimes fairly threw the boat at right angles to our course; and to have one of these catch us and "head us off," when a strong puff necessitated "heading up," we found not conducive to any very great confidence in our own ability to remain "right side up." We had no mishap, however, although a capsize was narrowly escaped in several instances, and camped opposite Kimswick, where we remained over the next day, and gave the boat a much needed coat of paint. We found that, notwithstanding her hard treatment on the Illinois, her injuries were confined to a few scratches and "digs," none of which amounted to anything. She also was perfectly dry, in fact, she didn't leak a drop all the way down the river.

Friday morning we continued our journey, making about twenty miles, a very good run, considering that we didn't get away from camp until about noon. Being novices in Mississippi traveling, we were for a long time under the impression that our camping places must be situated upon the banks, although their steepness made them far from pleasant. They average about thirty feet high, and have become terraced from the different stages of water, so that carrying our "camp truck" up these rude steps was quite a tiresome occupation. Even after reaching the top the ground was not as inviting as it seemed from the river, being usually "hardened muck," so that one night, being forced to take to a sand bar on account of the inaccessibility of the banks, we found it so handy, clean and comfortable that we resolved to make the bars our camping places in the future, and with but one or two exceptions we did.

Of course every bar would not serve as a fit camping ground, some of them being entirely destitute of fire wood, but as there is a bar for every bend, and also for every island, not counting the ones that are "just bars" on their own hook, there are plenty of chances to pick out one with a drift pile on it. To the man who has done his canoeing on open water or small streams these drift piles are indeed a revelation. The river banks from St. Louis to Vicksburg we found to be fairly covered with logs, fence rails, slabs, tree trunks and general debris, in some places piled so high as to render futile any attempt to get back into the woods; and as most of the stuff was thoroughly seasoned, it was like having a woodpile in your back yard. After passing Vicksburg we found the wood not so plentiful, as the banks were more thickly populated and the "niggers" burnt it up, but enough can always be found to make a fire for a regiment.

But to return to our subject. We had fair winds the next few days, with the exception of one or two when it was dead calm, and reached Cairo Oct. 26. The distance from St. Louis to Cairo is 215 miles, and was made in ten days; but our record will show up better when allowance is made for three full days used up in painting and trying to keep out of the rain. An evil spirit seemed to pursue us in this form, for we were treated to rain storms about three times a week, and finally "knocked out" entirely by it. The night before reaching Cairo we camped about nine miles above it, and the next morning

started out about 10:30 with the expectation of reaching the city by 12 o'clock at the furthest.

However, as we approached the city, it seemed to recede, and instead of finding it on the Mississippi as we supposed, we were surprised to find on arriving at the mouth of the Ohio that a two-mile pull against the current of that stream was necessary before reaching the town. The Mississippi was rising and set back into the Ohio, so our row was not as hard as it might have been. About 4 o'clock, just as we had finished stocking up with provisions, we were favored with our customary rain storm, and things soon began to assume a decidedly moist appearance.

For some time we were undecided whether to "sit it out" all night on the wharf boat under a sort of projecting roof, or make for a camp. We finally determined to row down to the mouth of the Ohio, where we had seen a stranded barge, and see if we could find shelter in her. On reaching the bar, we commenced to unload our truck after having pitched the tent, and were soon visited by a man who told us he lived in the shanty on the barge, and invited us to come up and get dry by his stove. We accepted the invitation, and proposed that he join us in our repast which I proceeded to prepare. He joined us, or perhaps I should say we joined him, for the way he did stow grub was a caution. Meat, potatoes, bread, coffee, all disappeared with lightning rapidity.

After eating until the visible supply was exhausted, he informed us that it was the best supper he had eaten for months, and it was almost inclined to think the only one. He then went on to tell us about his affairs—how he had been laid up with fever and ague all the summer, and was just beginning to be around—and got us so much interested that we resolved to fill him up tight in the morning, and I guess we did, but there was a very perceptible hole made in our supplies. We left him and his barge that morning about 11 o'clock with a stiff northwest wind, and had good sailing all day. We passed a place in the river near Wolf Island, below Columbus, Ky., where the river runs like a mill race.

It was by all odds the wildest water in the whole length of the river. The eddies became veritable whirlpools, strong enough to have rendered sailing in a head wind quite dangerous. We now began to meet any quantity of ducks and geese, and spent a good part of the time anathematizing the hard luck that caused up to neglect to bring guns. We thought we had seen some game on the Illinois, but we quickly came to the conclusion that we had been mistaken. For every duck on the Illinois we saw fifty on the Mississippi, and the geese were extra. Ducks were as plentiful as blackbirds, and the geese were in flocks of from ten to one hundred. On one occasion I saw a bar fairly covered with them, and think that there must have been fully one thousand. This may seem an exaggeration, but when the fact is considered that the bar was about two miles long, and that the geese were stretched out in line over its full length like a regiment in review, I don't think my figures will look so large. The birds were very wary, however, and could be bagged with nothing but a rifle.

We got in revolver range several times, but the unsteadiness of the boat destroyed our chances. A man with a good rifle going down the river as we did could not only have lots of sport but could also pay his expenses, as each wild goose brought to a landing is worth from $1 to $1.50, and I think we could have got ten a day at least. The landing stores are filled with canned goods of all sorts, so that the geese would act the part of a well-filled purse. This would not be pot-hunting, I think, and so could not be objected to as being unsportsmanlike.

We reached Memphis Nov. 3, the distance from Cairo being 250 miles in round numbers. We were laid up about three days by rain and head winds on the way, but made a fair average notwithstanding. The river between Cairo and Memphis has a great many "chutes," which may be described as one of the passages around an island, and so called to distinguish it from the other passage called the channel. I believe that by taking the chutes between Cairo and Memphis we saved about twenty-five miles, and even more between Memphis and Arkansas City.

Below Arkansas City, which is about 130 miles above Vicksburg, there are few short cuts, although the river is full of bends. It is very encouraging, I assure you, to come upon a stretch of ten or fifteen miles and then see away off to the right, abreast of you, the smoke of some steamer and realize the painful fact that you will have to go twenty or twenty-five miles by river when a straight line would probably bring you to the same point in about eight.

The current, however, is always on hand, and one is not very long making twenty-five miles. I think the average current was about four miles an hour, and this, together with a pair of oars, would send us along about seven or eight miles an hour steadily. At first we were disposed to take short cuts, hugging the points, skirting the bars, etc., instead of taking the full curve; but we soon learned that the longest way round was in fact the shorest; for the swiftest current takes the longest sweep, and more than makes up for the distance gained in the "cut." The "chutes" for this reason are to be avoided below Arkansas City, but above the current is about as strong in the "chute" as in the channel. In going around Island 35, which is just below Randolph, Tenn., we had a smashing breeze over the starboard quarter and took the "chute," which saved four miles. The current ran like a mill-race full six miles an hour, and this together with the wind, sent us along faster than I had ever gone before in a small boat. We just "buzzed" by the snags, and I estimate our speed to have been not less than twelve miles an hour.

J. W. Keogh.

THE WINTER CAMP-FIRE.

FOURTH MEETING.

Among the inventions that have been perfected to a point of practical utility within the last ten years, three stand out prominently from all the others, namely, the telephone, the electric light and dry-plate photography. The last of these, while perhaps the least valuable to mankind in general, is of the greatest importance to the traveler, the explorer, and, above all, to the canoeist, as while in his case it may be carried without the least extra trouble, it is a companion for his leisure moments, it records faithfully his cruises, and enriches and verifies his log book.

The last "Winter Camp-Fire," held on Jan. 29, at 23 East Fourteenth street, was devoted entirely to this subject, and proved by far the most interesting meeting yet held. The Kit Kat club room was ornamented with canoe pictures of all kinds. On the walls were a large number of very fine photographs by Mr. L. W. Seavey, mostly taken in canoe cruises, while on the easels were several fine oil and water-color pictures of Scotch canoes and scenery, as well as large photos of the Mersey and Clyde canoe clubs, loaned by Mr. King.

Among the pictures sent in were two very fine ones, a trophy of fish, rods, etc., and a snow scene, bringing home a deer, by Mr. J. G. Walton, of Sherbrooke, Can.; some small views taken on cruises, by Mr. Van Deusen, of Rondout, and two pictures sent by Mr. Shedd, of the Springfield C. C. The latter, taken by Mr. Lazelle, a photographer of Springfield, are very fine pictures, and were greatly admired.

Mr. L. W. Seavey, an artist who uses both the canoe and camera to assist him in his work, the painting of photographic backgrounds, introduced the subject, comparing the work of the painter when out-doors, as in summer, requiring time and more or less bulky materials, besides much skill, with that of the photographer, with a compact camera and packages of plates, requiring but little time, and giving very valuable results. Touching on the discoveries of Daguerre and Talbot, Mr. Seavey described briefly the old process, and then passed to the modern one. First comes the question, "What to photograph on a cruise." The speaker suggested first a view of the canoe, its sails, gear, etc., and also the crew, then when once started, the camp each day, natural scenery, characters, and on the return, crew and boat again, making, with brief notes, a full and accurate record of the cruise.

As an example of the value of photography, Mr. Seavey exhibited a sketch and photograph of the same object, one the work of an hour or so, the other, more accurate in every way, the work of a moment. After describing in detail the pictures of his cruises, Mr. Seavey exhibited and explained the necessary apparatus, first showing several holders for containing the prepared plate, and keeping it perfectly dark, also the manner of keeping a record of exposures on each holder.

An 8x10 camera was then shown, and the various parts explained. This camera was arranged with one large lense and two small ones for stereoscopic work, on one front, either the single one or the pair sliding into position at will. The drop shutter was also shown and explained. Another camera, a Pearsall, 6½x8½, was arranged very compactly, dispensing with an outside carrying box. Two novelties in this apparatus were a small roller curtain of tracing cloth to receive the image in focusing, instead of the ground glass commonly used, and a second bellows hinged to the back, also used in focusing in place of the focusing cloth.

One of the latest novelties in cameras is the gun camera, a box for 4x5 plates, fitted with an instantaneous shutter, worked by a trigger, the whole being carried on a common gun stock. A sight is used on top of the box. Still another similar instrument is known as the "Detective Camera," an oblong box about 4x6x8in., the lense and shutter being in one end. On top is a brass handle, and on one side is a small lense and a focusing glass about 1in. square, on which is shown, to a reduced scale, the image on the plate. The box is held in one hand, the position of the image on the plate adjusted by observing the image thrown by the supplementary lense, and the drop operated by the other hand. A number of very fine pictures taken with this camera by an amateur were shown with it.

Mr. Barnard exhibited a small but very compact camera mounted on a tripod called the "Reporter's Camera," as well as some views taken with it, after which Mr. Seavey explained the process of developing the plate, illustrating his remarks by developing two 5x8 plates exposed during the day. The subject for the next meeting, on Feb. 19, at the same place, is "Tents and Camp Outfits." The meeting adjourned at 10:30 P. M.

PITTSBURGH CANOE CLUB.

Editor Forest and Stream:

The first social meeting of the P. C. C. for 1884—a dinner given by our newly married Lieutenant on the 8th—was promptly followed up, and eight members—all who are now in the city—gathered around the festive board of the commander of the Lotos Flower at an early hour on the evening of the 25th. The good things thereon were only equaled by the feast of reason and flow, etc., and, starting with many a reminiscence of the ever memorable progress down the Allegheny last season of "eight canoes and a grub boat," the conversation quickly pread to all things pertaining to our noble pastime.

At length, the table being cleared, and eight pairs of legs extended thereunder with great sense of personal comfort to their owners, amid the fast thickening but wholly peaceful smoke, the idea was advanced that our "camp-fire" must surely be as pleasant as any held this winter in your city of New York. "'camp-fire,' quotha! as well call it an oil stove." The suggestion was received with the approval it so well merited, and for all time to come the archives of the P. C. C. bear record that at the second Oil Stove of January, 1884, such and such important business was transacted.

Among the questions discussed was that of the proposed change in our burgee, already noted in Forest and Stream, and a committee was intrusted with the task of ascertaining whether a device sufficiently like an oak leaf to be recognizable can be produced in gold upon a blue field. The proposed A. C. A. badge was heartily approved, and most present seemed to prefer the A. C. A. burgee, the colors of which can doubtless be sufficiently represented by ye cunninge artificer in ye preciouse metalls.

After this the conflict raged between the advocates of veneer and clinker build, all manners of steering gear held up for admiration and ruthlessly torn to pieces; and the fact developed that our small assembly embraced all classes; from the admirer of "simplicity" as exemplified by the lateen to one who, not satisfied with jib, fore and mainsails on a St. Paul, is now designing a topsail.

The oil stove burned brightly until the small hours, and then we wended our way homeward through an atmosphere thick with hoar frost. As we crossed the suspension bridge over the Allegheny we looked down shudderingly at the icy waters beneath, and, when the end was reached, cleared the chunks of ice from our moustache to hail the toll collector as to the state of his thermometer. The laconic answer came back "Two below."

Katrina.

THE GALLEY FIRE.

AN IRISH STEW.

Put a few splinters of wood in bottom of pot, on them place about one-quarter pound pork, sliced, and about one quart of water; let it boil ten minutes, and add two parsnips, pared and sliced, boil ten minutes longer, skim if necessary and season with pepper and salt; then place in half a dozen potatoes and boil twenty minutes longer or until the potatoes are done. This makes a hearty and savory mess.

Q.

CANOE PHOTOGRAPHS.—We have received from Mr. C. M. Shedd of Springfield, two very handsome photographs of the S. C. C. and their fleet of canoes, the work of Mr. E. J. Lazelle. The picture is taken with a "revolving camera," the only one used in the United States. The camera is first pointed directly across the river, and then revolved toward the north, giving the appearance of great width to the river. The results are very fine, especially when it is considered that the boats were in a swift current, and the house, as well as the raft on which the camera was placed, were both in motion.

HARTFORD C. C.—The H. C. C. have adopted as a sailing signal a red crescent one inch in length for each foot of length of canoe, with a red five-pointed star next the upper corner.

AMATEUR CANOE BUILDING.—This subject will be continued next week.

Yachting.

THE BOOM IN CUTTERS.

NEVER before were so many cutters on the stocks at such an early date as this season. We have already given particulars of four new cutters building by Lawley & Son, of South Boston; one by Williams & Stevens, of Lowell, Mass.; two on the stocks in Driscoll's yard at Greenpoint, and one in the shop of Stephens, on Staten Island, which, with the Daisy to be imported, makes a total of nine. We now add number ten, the keel for which is to be laid by Poillon, of Brooklyn. She is 51ft. loadline, from designs by her owner, a member of the Seawanhaka Corinthian Yacht Club, and will be similar to the Oriva. Number eleven is to be the biggest yet attempted in this country, for the owner of a well-known schooner. The design is now being struck in by A. Cary Smith. She is to measure 75ft. loadline, with four and three-quarters to five beams. We also know of many other cutters contemplated, and count on twenty or more of the kind for next season. The readiness with which we are taking to the cutter is the best proof of the growing fondness for real yachting in contradistinction to insipid dawdling.

COST OF YACHTS.

MR. HARVEY states that to build a large schooner he has designed in America will cost fully one-third more than in England. The prospective owner has determined to build in England. As the yacht will cost about $60,000, it was thought a little too high to pay $20,000 for the privilege of an American register. As the move for free trade in ships is now gathering force, the new schooner may after all be entitled to the flag of the country by the time she appears in an American port. It is even now found cheaper to buy yachts as good as new abroad and pay duty than to build in our yards. This can only be done with yachts under twenty tons which can be imported upon a nominal valuation as "wood manufactures." The Madge was assessed at $1,500 and the duty paid was $500. Her original cost with outfit was under $4,500. She could not be duplicated here for less than $6,000. It is likely more yachts will be imported as the number of good vessels at reasonable figures to be had abroad is legion, with the advantage of all sizes, kinds and rigs to pick from. The ten-ton cutter Florence, for example, with a record as a racer, can be had for $2,500, or less than half the money a new yacht of the kind could be built for here. She is about of the Madge's proportions. The importation of foreign yachts is something which has only just begun and is likely to assume great proportions before long. It is well to warn builders in time of what the near future will disclose, so they can shape their policy accordingly.

Greater business tact and more enterprise are needed if the competition from abroad is to be staved off. An English yacht, three to five years old, from the hands of a crack builder, which has been well taken care of all the year around, is not only cheaper, but a stronger, better and more stylish job than a brand new yacht from any of our yards, as she is built to much more thorough specifications in the first place, and will outlive home-built craft two years to one, to say nothing of the outfit which comes along. There are those silly enough to confound throwing dust in people's eyes with "patriotism." They are the worst enemies of all yachting interests in America. Unless our builders wake up on all tacks, they will find their avocation slipping from under, free ships or no free ships. We know, as an illustration, that the cutter Daisy, only two years old, fully as good as new, and of vast deal better build and fittings than boats of her size of American origin, can be imported, duty paid, for little more than half the cost of a new yacht, inferior in all points, built in New York or Boston. We know that she will cost afloat in these waters less than the figures at which four-year old sloops were offered, with their poverty-stricken rigs and forlorn equipment. Seven years hence those sloops will be worthless for aught but firewood. Seven years hence the Daisy, fairly well looked after, will still fetch half the money laid out. Can any one blame her owner for his good sense in looking after his interests and buying abroad when such advantages are held forth? And is it not likely a great many will follow his example?

Will our builders take warning while there is still time, or will they wait till crippled or swept away altogether by the coming deluge of importations? This is certain, "patriotism" must be hove overboard at once. Instead of blowing upon achievements in the past, the stern present must be looked in the face. Our yachts are woefully wanting in equipment, style and finish, whatever may be thought about model and method of build. People who travel are learning to appreciate the truth of all this. Once let importation obtain full sway and neither progress nor real merit of our home productions can stay the influx for a long while to come. There is no desire on our part to cry "wolf." We are posted on the drift of public opinion, and know that many have in mind purchasing abroad, because they get more and better for their money. Pot bellies and stub-tail sterns, cheap and homely rigs, paint bedaubed decks and graceless superstructures, clumsy scantling and stingy fastening, crude taste, offending want of symmetry and corelation in all parts and belongings, gawkiness aloft, uncouth pose, and the provincial vapidity all over, one and all, and a great many other technical laches must give way to a more discriminating and exacting taste, a higher degree of intrinsic worth and superior mechanical completeness.

SOME REMINISCENECES.

A GENTLEMAN of life-long experience in yachting writes us that he takes great interest in the development of seaworthy boats, and that his own observations lead up to conclusions identical with our own. As far back as 1836, when the Northern Light was built by the late Col. Winchester, he made several runs in her from Boston to Newport and the westward. She drew 10ft. of water with ballast moulded as low as it could be got. She was a keel boat, and nobody ever asked how the weather was going to be, for she was always got underway at the hour determined and took it fair or foul and rough or smooth, as it happened to come. In 1840 he built the Gypsy, 39ft. loadline, 12ft. beam and 5ft.6in. hold, with 7ft. draft and a keel, as all good boats were built in times gone by. She was run four years about the coast, gunning and fishing. When it blew she was reefed down, and when it came out too heavy to look to windward, she was allowed to lie to. In 1845 he built the Pet, 32ft. loadline, 10ft. beam, 6ft. hold and 5½ft. draft, with 25 tons moulded to the floors. She, too, was a keel, and no one objected on the score of her draft. Yachtsmen were sailors then and knew how to appreciate a good boat. She was sold to Savannah pilots after a successful career as a racer in all kinds of weather. She left Boston in company with a ship bound the same way, and a purse was made up for a match into port. Pet captured the money, half the voyage under two reefs in a gale of wind.

In 1846 he constructed and fitted the Coquette for Jas. D. Perkins. She was 66ft. long, 19ft. beam, and 10ft. 6in. draft with keel. This was the memorable boat which took the starch out of Stephen's big smooth-water machine Maria, in a match twenty-five miles to leeward and return off Sandy Hook, Oct. 21, 1846, in blowy weather and a jump. Time, six hours and fifty-six seconds. Maria was much the larger of the two, but depth and draft were then as now, more than a match for board and flat bottom. The same gentleman now has a deep catrig yacht 23½ft. long, which lords it over Buzzard's Bay in a reefing breeze. Two things, he writes, his experience has demonstrated necessary in a good boat. You must have depth with draft and weight for the most satisfactory performance. Beam may be left an open question, as it will adapt itself to the rest, or else the boat will be indifferent under sail when beam is carried to excess. He sailed the sloop Una, a deep boat with four beams to length. She was a trump in a breeze and sea. In the good old days yachtsmen were on the right track. All the more strange we should ever have swerved so far from the lessons of experience, and all the more reason why we should sheer broad off from the flat bottom river traps, and once more return to honest construction with the depth, draft and weight a good boat ought to have.

HOW NOW?

IN the report of the British Y. R. A. committee on measurement for small yachts occurs the following passage:

"The fact cannot be overlooked that a rating by length would *fail entirely* to class boats unless they were all of one particular type. For instance, during the past two seasons the Chittywee and Mascotte, two yachts of three tons, built to compete under the tonnage rule, sailed against the most recent specimens of 30-footers with the result that they (Chittywee and Mascotte) were beaten over a seventeen mile course by about 13min. This result was due mainly to the fact that the broad 30-ft boats are able to carry a much larger sail spread than the narrow 3-tonners, in consequence of their *greater weight* and beam."

That is to say, the experience gained by sailing small, narrow cutters against larger, heavier, bulkier boats in Southampton waters has plainly demonstrated that *bulk* on a given length, when properly shaped, is an element of speed! That it cannot be fair to sail small and large boats of like length without an allowance to the smaller one for the greater possibilities for speed possessed by the larger boat.

The committee therefore proposed to roughly measure such differences in size by taking the larger sail area of the larger boat. Bulk or bigness which finds its expression in sail area in yachts of normal shape and like construction is then, according to the Y. R. A. committee's conclusion, really the just basis for allowance between boats of like length. A stronger and more obvious indorsement of the equity of bulk measurement from better authority could not be forthcoming. The recommendation amounts to this: You are to be limited for classification purposes to a certain length and pay for differences of bulk on that length as expressed in the sail area. As there is no especial reason whatever for limiting a designer in the choice of one dimension more than in the remaining two, the next step in common logic will be to permit the free selection of length just as well as beam or depth, with a penalty attached only to "bigness" regardless of the form it assumes. Then, and not until then, will the measurement question come to a rest.

The committee likewise indorse the position of Forest and Stream concerning the extravagant forms and great expense to which the length rule leads directly. The biggest boat, biggest displacement and rig. The greatest outlay of money and the exclusion of all moderate forms and rigs of the same length. In place of a long boat of economical proportions, the length rule induces a shrinkage of useful length and eschews economy, prohibiting in its taxation of length, all boats which are not the clumsiest, most expensive and unhandy in connection with the least practically available accommodations.

The committee's decision is a death stroke to length measurement abroad and will not be without its influence in bringing about a clearer understanding on this side of the Atlantic of the prejudice and evil tendencies of measuring by "simple length."

GIVE IT SUPPORT.

WE publish herewith an appeal to all hands of more than ordinary importance, and hope that at least the proposal to build up general yachting headquarters will at once receive enough support to justify taking further steps. Whatever may be thought about the practicability of forming a racing association for the government of clubs, the scheme to institute a great central rendezvous with accommodations and facilities of use and benefit to every owner and friend in sympathy with yachting ought not to be allowed to fall through for lack of encouragement to the committee having the matter in charge. In unity there is strength, and should the New England organizations all contribute to the establishment of a congress having tangible existence, the move would be a step ahead of anything yet undertaken, and would redound to the credit of the prime movers and the whole of New England, as it would likewise be of inestimable benefit to the progress and popularization of the sport. Centralization and action as a united body would quickly supplant influences only spasmodic and local with wide-reaching sway and prestige instead. It is above all else the one thing most needed for the growth and prosperity of yachting. There are a hundred persons who might and ought to own yachts to every one actually flying his burgee aloft, and nothing would contribute so much to fresh accessions to the fleet as a common heart to reflect the pulsations of yachting life. It is to the activity of New England and the ripe development of its yachting we look for the birth of ideas and practices in time to become the standard along the whole coast, and we hope the expectations raised in the subjoined proposition will not be doomed to disappointment through individual lethargy or fatal delay. All hands should clap on without any hesitation. Aid and abet the scheme now while aid from every man is needed:

NEW ENGLAND YACHTING ASSOCIATION.

YACHTING CONGRESS.

Among the yachtsmen of New England, especially those residing near Boston and belonging to many of the clubs, there has long been felt a desire for a greater uniformity in measurement, time allowance, and all the details of yacht racing rules and regulations.

In order to effect this, and establish a permanent congress for the consideration of these points, and also the best method of promoting their adoption, it is proposed that, annually, each club appoint one or more delegates, who shall meet as often as may be necessary.

It is also suggested that such a congress would afford a proper authority for the settlement of any important questions arising during the racing season.

YACHTING HEADQUARTERS.

As important and desirable as the foregoing, is the establishment of headquarters for all yachtsmen belonging to any recognized yacht club, to be supported by its individual members.

The advantage of such a headquarters is manifest to all yachtsmen. It would afford a rendezvous for the meeting of those heartily interested in yachting, there to discuss the events of interest in seasons gone by, and to arrange and plan for the future. The best types of hull, and the best rigs, spars, and sails could be thoroughly discussed.

All yachting magazines, both foreign and American, and such yachting publications as may be desirable, could there be found.

A bulletin for news, exchanges, sales of yachts, etc., could be established. It would afford a repository for all new inventions connected with yacht building and fitting, and numerous other advantages would inevitably arise from the establishment of such an organization, which, it is believed, could be started and maintained at a moderate yearly due.

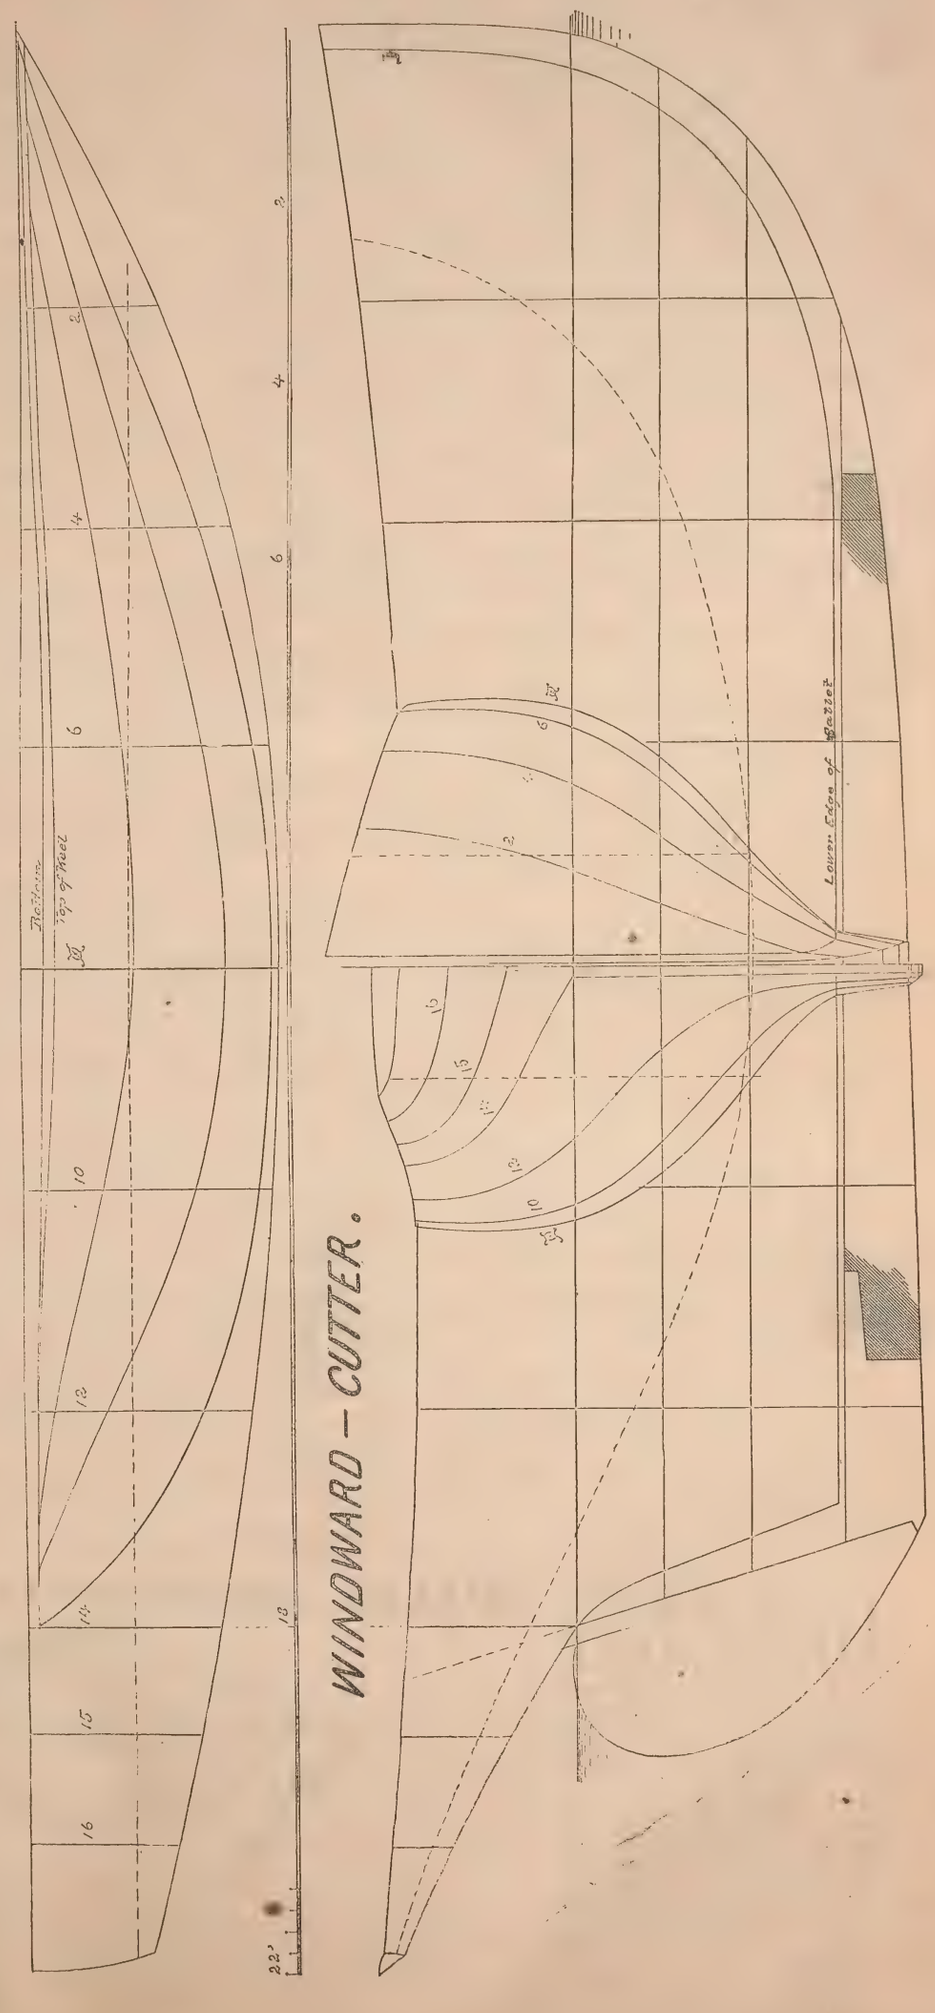
It should be distinctly understood that while the yachting congress before mentioned, though being under the same head of the New England Yachting Association, is entirely separate and distinct in its workings. It would be entitled, of course, to the free enjoyment of all the privileges of the headquarters.

In order to approximate the support this enterprise will receive at its inauguration, the committee appointed to select rooms for the headquarters and to ascertain the probable expense of the project have concluded to send with this circular to each member of the different yacht clubs of New England a postal, with a request that all who will aid in the start and support of the association will return the same with favorable answer. The next general meeting of delegates, committee and club members interested in this enterprise will be held at the Parker House, Boston, Thursday, Feb. 7, at 7:30 P. M.

Committee.—C. A. Perkins, Chairman; Fred. Pope, W. L. Jeffries, L. M. Clark, Henry Bryant.

SMALL BOATS.

THE cause of small cruising yachts is looking up. Inquiries for models, cost of building, etc., pour in upon us, and builders, notably from towns along the Chesapeake Bay and on the lakes, and many exhibit a preference for the yawl rig. One inquirer wishes to know how to steer with a tiller in a square stern yawl, the mizzen-mast interfering. The tiller should be made of iron, with an elbow or bend in wake of the mizzen, so that it can be put hard over without striking the mast. Or the tiller may be split open, the mast passing down through the hole, which should be elliptical with the major axis athwartships, and long enough to permit the required play to the tiller from side to side. Such a tiller could not be unshipped. Application of a little mechanical genius could easily overcome this drawback. A number of single-hand yachts are already under way for owners in this city and in Boston, of which particulars have been given. No form of yachting becomes more intensely absorbing than single-hand sailing when rightly pursued. The fact of being captain, crew and cook, with no divided responsibility, completely unfettered, at liberty to commit all the blunders you like, unanswerable to anyone but yourself for the consequences, with the sense of perfect freedom, and the consciousness that all depends upon action and judgment of your own, contribute to surround single-hand sailing with an amount of irresistible fascination and a fullness of realization which never pall upon the taste but incite the appetite for more, which no end of cruising nor advancing age can appease. To the youngster, to the man, and to the veteran at the helm, sailing single-handed is sport unequaled. And this is within the reach of the millions, as soon as they learn of what a good boat consists. The San Francisco *Breeder and Sportsman* has the following on the subject:



"Learning to sail in small vessels makes a sailor of a man, for the reason that everything that is necessary to be done must be done by himself or one of his companions, not by paid seamen. When a gentleman without any previous experience builds a large yacht and attempts to sail her himself, it is about a parallel case of teaching an apprentice of any trade by putting him at once on the most difficult work to be found. After a long time he may succeed in doing the difficult work, after a fashion; but how much better does the apprentice who has worked his way up to this same work. Again, when the gentleman finds that sailing a yacht is not such a simple thing as he fondly imagines, he becomes disgusted and also sells out, almost always at a terrible sacrifice, and not only retires himself, but deters others from his experience from interesting themselves in yachting. We can recollect when the Lively, yawl Ariel, and other boats of that build and size, had special prizes offered for their build and class, and they used to go over the course in the heaviest kind of weather, and have as much interest taken in their movements as in those of the large yachts. This was as it should be, and this built up a hardy race of yachtsmen, many of whom are still with us. Encourage the small yacht owners, give them place in your discussions, endeavor to get more people to build small yachts, and then, after a season or two of such a system, you will see and admit the truth of the foregoing remarks."

Additions have lately been made to the fleet of small yachts in considerable number. There was not long ago an impression that small but deep keel boats could not be made to sail or show speed and that in spite of their solid advantages in respect to room, safety, and general cruising adaptability, they would not become popular because lacking in speed. This was the theory of the old skimming dish school, and was clung to tenaciously by many who have since learnt otherwise. For example, sundry members of the Larchmont Y. C., had been indulging in the usual idle gossip and fantastical exaggerations about the speed of the centerboard sloop Gleam, belonging to Mr. Lawton, the little unpretending keel cruiser Aneto being at the same time cited as a style of boat unable "to get out of her own way," etc., etc. This kind of silly gossip reached its height on a certain day last fall. Next morning there was a nice sailing breeze blowing, which brought the extravagantly sparred machine Gleam down to a couple of reefs. The Aneto, with a snug yawl rig, which every one knows to be less effective than sloop or cutter, happened to get under way at the same time, and an impromptu match was arranged with the result that the despised "old hulk" gave the Gleam such an out and out tanning on all points, that the day has since become memorable for the conversions effected.

The conclusion fell like a bombshell in the camp and blew to atoms many cherished theories and groundless prejudices. Needless to say, that Aneto and her class are spoken of since then with profound respect instead of derision. It is not always safe to judge of a yacht by ruling customs or standards of beauty. A high side and short counter may not be attributes of beauty in the eyes of those educated to a sandbagger's proportions, but freeboard and low weight with good lines below in the Aneto were discovered to clothe qualities of greater intrinsic value than the assumed beauty of outline with which Gleam's friends invested the sloop, and upon which they too hastily decided beforehand the relative speed of the two yachts. We believe Aneto is to have her overhang spun out this spring, and that she will also receive a racing rig. In that event, she may surprise her detractors in light weather as completely as she already has done in a blow. Meanwhile, the building of small cutters has taken a fresh start, and accessions to the fleet of small yachts are promised for the coming season. The time is not far distant when a club will be formed in New York especially devoted to the interests of yachts under 30ft. loadline. If this move be started by the proper persons animated with the right spirit, a future is certain which will eclipse in point of membership and activity any organization in these waters. There is field enough to draw upon for a thousand members and five hundred yachts, with club house and anchorage second to none of the existing institutions.

We publish herewith the lines of a new cutter, now planked up in the shops of W. P. Stephens, of Staten Island. She is a very taking boat, out of which the maximum of service can be got at merely nominal expenditure for keep. For cruising and fishing and for general yachting life afloat, as well as for racing, boats of this class appeal to the masses who wish to indulge in rational sport upon a small outlay of money. Such boats are not mere outlines of regular yachts like the sandbaggers and open boats, nor mere harbor-drifters, like other makeshifts, but fit for all the work and service to which a large and costly vessel can be put, differing from their big sisters only in tonnage and the distances they can cover in a given period of time. This new boat is building for Mr. Willoughby, who has "tired of keeping sailors' boarding-houses," and now proposes to do some sailing himself. The rig will be either yawl or cutter. Small cockpit and sail hatch aft and hatch over cabin.

Length over all	22ft.
Length on loadline	18ft.
Beam extreme	6ft.
Depth of hold	4ft. 9in.
Draft extreme	4ft.
Draft mean	3ft. 4in.
Least freeboard	1ft. 9in.
Displacement	116.6cu.ft.
Displacement in tons, 2,000lbs	3.75 tons.
Coefficient of fineness	0.224
Iron on keel	1,500lbs.
Iron inside	2,060lbs.
Ratio of ballast to displacement	0.5
Area loadline plane	69 sq. ft.
Area midship section	11.2sq. ft.
Area longitudinal section, no rudder	65.6sq. ft.
Area wet surface, no rudder	173 sq. ft.
Area of rudder, both sides	11.6sq. ft.
M. S. abaft center of L.W.L	1.5ft.
Center of buoyancy ditto	0.72ft.
Center of lateral resistance ditto, with rudder	1.43ft.
Center of buoyancy below L.W.L	1.16ft.
Meta center above center buoyancy	1.32ft.
Center buoyancy forward of M.S	0.78ft.
Center lateral resistance ditto	0.07ft.
Area lower cruising sails	450.00sq. ft.
Sail per square foot wet surface	2.06sq. ft.
Total wet surface per ton displacement	49.2 sq. ft.

THE LIFE-SAVING SERVICE.

THE service embraced at the close of the last fiscal year 194 stations, 149 being on the Atlantic, 37 on the lakes, 7 on the Pacific, and 1 at the Falls of the Ohio, Louisville, Ky.

The number of disasters to documented vessels within the field of station operations during the year was 300. There were 3,792 persons on board these vessels, of whom 3,777 were saved and only 15 lost. The number of the shipwrecked who received succor at the stations was 651, and to these 1,879 days' relief were afforded. The estimated value of the vessels involved in these disasters was $5,100,925, and that of their cargoes $2,075,615, making the total value of property imperilled $7,176,540. Of this amount $5,611,800 was saved, and $1,564,740 lost. The number of vessels totally lost was 68. In addition to the foregoing there have been 116 disasters to smaller craft, such as sailboats, rowboats, etc., on which were 244 persons, 240 of whom were saved and 4 lost. The property involved in the latter disasters was $66,180, of which $59,900 was saved and $6,280 lost.

In addition to those saved from vessels there were twenty-two persons rescued who had fallen from wharves, piers, etc. Of nineteen persons lost nine were drowned by the sudden capsizing of vessels before assistance could reach them; seven were lost in endeavoring to get ashore by their own efforts, one perished from being thrown overboard and one died as soon as landed.

The number of disasters last year exceeds by seventy-one the number of disasters of the year preceding, which was considerably larger than that of any previous year in the history of the service. The amount of property involved was $2,476,493 greater than in the preceding year, but the amount lost $88,750 less than that of the preceding year.

The assistance rendered during last year in saving vessels and cargoes has been much larger than in any previous year, 337 vessels having been worked off when stranded, repaired when damaged, piloted out of dangerous places, or assisted by the station crews. There were besides 125 instances where vessels running into danger of stranding were warned off by the night signals of the patrols.

Since the last report seven additional stations have been completed—one at Hunnivell's Beach, Me.; one at Muskeget island and one at Coskata, Nantucket, Mass.; one at Brigantine Beach, N. J.; one at New Inlet, one at Cape Hatteras, and one at Ocracoke, coast of North Carolina. Four other stations are in process of construction and approaching completion—one at Lewes, Del.; one at North Beach, Md.; one at Wallop's Beach, and one at Parramore's Beach, Va.

There have been nine sites selected for new stations which it is proposed to erect soon—one at Brenton's Point, L. I.; one at Grand Marais, Lake Superior; one at Frankfort, one at Pentwater, one at White River, one at Holland, and one at South Haven, Mich.; one at Michigan City, Ind., and one at Sturgeon Bay Canal, Wis.

AMATEUR LOGIC.

NOT long ago Mr. N. D. Lawton undertook to enlighten the public in the matter of measurement through the columns of the *Herald*. Mr. Lawton averred that experience had shown the narrow five and three ton cutters unable to compete with the beamier Itchen boats of same length.

If a broad boat is faster than a narrow one of same length, it must be evident that a length rule places a premium upon the construction of beamy boats, and exhibits in its workings a prejudice in favor of one style at the expense of another, which no equitable rule ought to do.

Again, if the broader boat is the faster of the two, by virtue of her enjoyment of beam, then how can a comparison by length alone be logical or fair with another which does not enjoy like possibilities for the production of speed?

By Mr. Lawton's own argument the fallacy and deleterious working of "simple length" are shown up in all their nakedness.

Length rules are well enough as long as boats are all of one type. But in that case the diameter of the galley stove pipe will serve just as well. It is in the competition between different types that the prejudices of "simple length" are quickly discerned. As deep boats of great beam are the most expensive to build and sail and dip to the greatest draft of water without returning in proportion anything worth having, unless it be accommodation for a party of picknickers in a cockpit, the simple length rule will never receive the indorsement of persons who appreciate the economics of design and cruising. Moreover, any rule which frowns down free choice of forms but artificially stereotypes particular proportions, brings progress to a standstill. If Mr. Lawton is correct in his statement that the greater beam of the Itchen boats has been shown to give them greater possibilities for speed, it follows that beam should pay upon exactly the same ground which is advanced for the taxation of length. This is in the main accomplished by the sail area and length rule, as, broadly considered, every addition to beam as well as to depth increases stability and the canvas carried in consequence. While we are unable to concede any sound theoretic basis or accurate application to that rule, inasmuch as it supplies in most cases a crude comparison of the actual sizes of boats, it is certainly far preferable to that simple length, the equity of which Mr. Lawton has so effectively if unwittingly impeached in citing the supposed performance of narrow cutters in comparison with beamier boats. But Mr. Lawton owns a nice little round bowl as broad as she is long, and being no great sailer except in light weather through the aid of an extravagant area of sail, the key to prejudice is easy to find. Every man for his own boat and to the devil with equity.

CONCLUSIONS OF Y. R. A. ON MEASUREMENT.

THE committee appointed by the Council of the British Y. R. A. to report on the lengths which should be recommended for adoption in the length classes met on Monday last. The members of the committee were Mr. Frank Willan (chairman), Col. Dugmore, Mr. W. Baden-Powell, Mr. Henry Crawford, and Mr. G. B. Thompson.

The committee having heard various letters read from different clubs which had been asked to express their views, unanimously decided to recommend that the classes should be 21ft., 25ft., and 30ft., and that boats exceeding a class length must go into the class next above if raced.

The committee also decided to recommend that for time allowance in the different classes the sail area rule of the Y. R. A. should be used with the Y. R. A. time scale by tons. The rule is as follows:

$$\text{Tons} = \frac{\text{sail area} \times \text{length}}{6000}$$

The committee came to this decision because the types of boats around the coast vary to a large extent, and, even in any particular locality, there is considerable variation of type. A simple length rule would not therefore enable these boats to compete together in a satisfactory manner, and, moreover, the old boats which have been outclassed owing to the greater weight of lead keels and larger sail areas of the newer boats required to be considered, and it is hoped that they will be able to compete with some chance of success under the sail area rule. Beyond this the cost of producing boats in the length classes year by year increases just as it has in the tonnage classes, and the committee thought that this growth of the expense should be controlled if possible, as it tended to limit the sport to a few.—*London Field.*

We may add that experience on this side of the Atlantic bears out in full the conclusion of the British Y. R. A. committee that boats of varying type cannot fairly be classed by simple length, and that such a system of comparison leads to the largest and most expensive boats on the length, driving all moderate sizes with moderate rigs out of existence through the failure to measure size sufficiently near the truth. While the sail area and length rule does not accomplish this in all cases, it comes so much nearer to a relative estimate of size in the majority of instances and extends proper consideration to reasonable forms and rigs that it is to be preferred to simple length. After a reasonable size has been reached on a given length, a further increase, whether in the depth and displacement of cutters or in the beam and above water bulk of a sloop, adds nothing in the economics of a yacht worth having, but increases the expense of build and commission. The additional size, however, supplies further power and ability to the boat and, escaping taxation under a length rule, compels building up to an undesirable extreme in cutter as well as in sloop whether you like it or not. When taxed through the sail rule, the compensation granted to smaller boats permits the choice of a moderate form and equity in racing against larger and more powerful yachts of the same length, which is as it should be in justice to all and with regard to latitude of model, allowing every one to settle upon size and rig he prefers without prejudice to any style. The logical derivation of sail area and length is open to question, but in its practical workings it is much more rational and less proscriptive than comparison by simple length.

THE NEWPORT MATCH LAST YEAR.

Editor Forest and Stream:

I am not surprised that Fortuna should be the favorite of FOREST AND STREAM over schooners of the American idea. Sound Fortuna's trumpet all you please, but don't make assertions about other boats that you cannot prove. You state that in the Newport race last summer Montauk, "on edge and battened down," barely beat Fortuna five minutes, when the fact is, there was not a hatch or skylight closed on Montauk in the race, and so far from being "on edge," there was no time during the race when she was down to her scuppers. At the finish Fortuna just weathered the lower end of line, while Montauk had to bear away to cross. Fortuna could not have reached the windward position in which Montauk crossed in fifteen minutes. The apparent better time of Fortuna down the wind was simply the result of advantages and by Fortuna holding on to her kites longer than Montauk. The fact that Montauk beat Fortuna easily down the wind when the squadron left Newport proves the boasted superiority of Fortuna down the wind is pure fiction. Montauk stands upon her merits, and, though losing two drift races, she has never yet been fairly beaten. GUEST.

[Concerning hatches being battened down and sailing on edge, our information was derived from several sources. As but little of the match could be seen, we, of course, accept the correction made by a "Guest" on board the Montauk during the race. We have likewise reports from different sources that Fortuna was found the better of the two whenever sheets were lifted. As to Montauk's finishing higher up than Fortuna, it was due to making a hitch to sea after the turn and the subsequent veering of the wind favoring the weathermost yachts and forcing the others to pinch. This also accounts for the difference at the finish. We do not "favor" Fortuna in particular, but simply desire to see a just record to both sides. As the "patriotic" division of critics took care of Montauk's case, we sought to arrive at conclusions upon the technical issues of the day, and they are not weakened by our correspondent's letter. That it is not a difficult thing to press Montauk to a capsizing point was made very clear early last spring.]

NUMBER TWELVE.

THE twelfth cutter underway for next season is a very handsome boat building by Lennox, of South Brooklyn, for Mr. Ripley. She will be 30ft. over all, 25ft. water line, 8ft. beam, and 5½ft. draft, with two tons lead on the keel. The wood keel is 8x5 inches. Single steam-bent frames all through, flush deck, and full cutter rig. This new yacht will make a splendid match for the Daisy, to be imported. The backbone and frame is all out, and the work is now being put together. This cutter is from designs by her owner.

PRESENTATION.—"Old Wul Fife," the famous builder of a long string of crack vessels hailing from Fairlie, Scotland, was recently presented with a lifelike portrait of himself by a host of admirers. Mr. Fife is not only one of the most successful builders of modern times, but also a highly respected citizen of the town of Fairlie, in which he holds many responsible positions. Among his famous racers with their biggest winnings we may name: Fiona, 78 tons, Mr. Boutcher, who won $3,800 in 1870. Neva, 60 tons, Mr. R. K. Holms Kerr, $6,700 in 1877. Annasona, 40 tons, Mr. Hedderwick, $7,800 in 1882. Ulidia, the smartest 10-tonner afloat, Mr. Corry, $1,100 in 1883, and Camilla, 5 tons, Mr. Lawson, who won $1,000 in 1877, or nearly half her first cost. Mr. Fife has a promising son, who designed Annasona, Ulidia and others and upon whom the talent of the father has descended. "Young Fife" is now superintendent of the Culzean Launch and Yacht Works, of which the Marquis of Ailsa is owner. He has now in hand some new racers for this season which will no doubt show a long string of flags at the close of the match sailing next fall.

NEW SCHOONER.—The Palmers of Noank are putting up a large schooner of their customary style and build for Mr. H. D. Burnham of Boston. Length over all, 115ft.; beam, 23ft.; hold, 10ft. A keel boat with a back bone 36x12in.; stem and post, 10x14in.; frame of oak; locust stanchions; 3-in. oak plank; pine ceiling; 2¾in. square white pine decks; rail cap of oak 9x3in.; copper and galvanized fastenings; mainmast, 87ft.; foremast, 85ft. 8in.; mainboom, 70ft.; gaff, 33ft.; foreboom, 30ft.; gaff, 29ft.; topmast, 41 and 40ft.; bowsprit knightheads to cap, 24ft.; jibboom, 25ft. beyond cap; spinnaker boom, 73ft.; sails by Sawyer.

COMPROMISE SLOOP.—The little sloop, already mentioned in our issue for Jan. 10, building for Mr. Forbes' sons, is of the compromise type, having good depth of body and a small board, which could be done away with by the addition of 8in. keel. She will have 4,000lbs. lead outside and 744sq.ft. of sail with housing topmast, mast deck to hounds 30ft. with 3½ft. masthead. Topmast, 15ft.; boom, 26ft.; long gaff of 17ft. and bowsprit 12ft. outboard. She is 28ft. loadline, with 5ft. cutter overhang, and 3ft. 9in. draft without board.

BUNKER HILL Y. C.—Membership is now 51, owning 4 schooners, 13 sloops and 6 cats. Present rooms of the club are on Wellington's Wharf, East Boston. Officers elected for the year: Commodore, P. M. Bond; Vice-Commodore, D. C. Musgrave; Fleet Captain, W. H. Hodgkinson; Secretary and Treasurer, B. F. Underhill, Jr.; Financial Secretary, George W. Abbott; Trustees, William H. Tolman, George T. D. Williams, T. B. Rich; Measurer, Harry L. Johnson.

NEW SCHOONER.—Mr. A. Cary Smith is at work on a new four-beam keel schooner of 65ft. loadline and 9ft. water, for San Francisco owners. Moderate beam and good draft is carrying the day all the country over.

ABANDONED.—The collapse of length measurement in England is noticed on the editorial page.

A COMPLIMENT DESERVED.—Marine Engineer Saefkow, of the Imperial German Navy, has been elected an honorary member of the Rhe Y.C. of Stettin, in consideration of the valuable aid and impulse he has given to yachting on the Baltic. This election has been conveyed through an elegantly illuminated diploma composed of yachting and nautical subjects grouped in a water-color painting with appropriate resolutions attached.

THETIS.—According to the Boston *Herald*, April 28 has been selected for the launching of Mr. Henry Bryant's new yacht from W. B. Smith's yard at South Boston. She is now about planked up and laying the decks has commenced. Her tender will be of the whaleboat pattern, 18ft. by 4½ft., built of cedar and mahogany.

CORRESPONDENCE.—We answer nearly all inquiries by letter. It is necessary that proper address should be given in all cases. Specific data where alterations are contemplated are required to form an opinion.

GOOD-BYE STUB-TAIL STERNS.—The sloop Thistle, originally of Boston, now the property of Mr. Wm. Ziegler, is to be spun out aft by the addition of a cutter's fantail.

ANSWERS TO CORRESPONDENTS.

E. C. F., Cornwall, Pa.—The owner of Dash III. is Mr. A. M. Tucker, 85 Main street, Charlestown, Mass.

H. D., Baltimore, Md.—The dam of Snap is Hill's Tillery. She was by Scout (Plunket—Carrie) and out of Beauty (Plunket—Nell).

AMATEUR, Augusta, Ga.—The rules of the Eastern Field Trials Club require that the sire and dam of entries be given. The National rules do not.

RAMBLER, Waynesburg, Pa.—Rose and Noreen are owned by Dr. Wm. Jarvis, Clairmont, N. H.; Lady Clare by Mr. J. S. McIntosh, Pittsburgh, Pa., and Trix by the Glencho Kennels, Peekskill, N. Y. All are first-class animals.

A FEROCIOUS BUCK.—An Adirondack guide, when arrested and brought to trial for killing a deer out of season, pleaded not guilty, and explained that he was afraid the deer was going to bite him. If that man reads the New York *Sun*, he has doubtless seen this bit of correspondence from Rollandsville, Pa., Jan. 29: The game law of Pennsylvania prohibits the killing of deer after Jan. 1, and consequently something of a sensation was created in this village when Jordan Mapes and Frank Grover, two well-known citizens, drove in on Saturday with the body of a large buck in their sleigh. They drew up in front of Crane's store, and the entire village soon surrounded the sleigh, and questions poured in thick and fast on Mapes and Grover. Such a bold and open violation of the law had not been known in years. John Rollands, a well-to-do citizen, took the men to task, and declared he would have them arrested. They told him that he had better not have them arrested until he had heard how they came by the deer, and Grover made the following statement, which Mapes corroborated: "We were driving through the piece of woods beyond Fairland's mill," said he, "when suddenly the buck jumped out into the road and attacked our horse. It tried to strike the horse with its fore feet. We whipped up and yelled at the deer to frighten it away, but it then turned on us and tried to jump into the sleigh. Frank fought it with an axe helve we happened to have with us, while I plied the whip on the horse. But the more Frank battered it over the head the madder it got, and it finally ran off to the edge of the woods, and, giving one leap, landed plump in the sleigh right across our feet. We both jumped out and made for the woods. The horse went on, with the buck lying clear across the sleigh, its hind legs hanging over on one side and its fore legs on the other. It took the deer quite a while to get out of the sleigh, and then it came tearing back after us. We were scared half to death. Frank succeeded in getting up a tree out of reach, but I couldn't climb, and, seeing I was in for a fight, I grabbed a rail from a lot that happened to be cut and piled there, and when the buck came rushing at me I let him have it square in the forehead, and downed him. Before he could get up I hammered the life out of him. Frank then got down out of the tree and ran down the road after the horse. He found it by the side of the road all right, a mile away. He brought the sleigh back, and we loaded the buck in and brought it home. We couldn't see any particular point in leaving it in the woods for wildcats to feed on. The deer must have been driven by dogs until it was crazy, and didn't know what it was doing. If you take us up, Mr. Rollands, I don't believe you will be able to make us out guilty." Justice Wilson, who was present, was positive that there was nothing in the law forbidding peaceful citizens to defend themselves against the attacks of wild beasts known to be so fierce and bloodthirsty as deer. Mr. Rollands concluded, under the circumstances, not to make an arrest. Mapes and Grover offered to raffle the deer off for $25, and to give $10 of the proceeds to the poor fund. The offer was accepted, and twenty-five chances, at $1 a chance, were soon disposed of. Justice Wilson took two chances, John Rollands took two chances. Justice Wilson won the deer. It was lifted out of the sleigh and placed on the stone stoop. In the afternoon the 'Squire drove down and loaded it in his sleigh. On his way home he was stopped by Constable Winans. "'Squire," said the constable, "I've got a leetle war'nt fur ye!" "A warrant!" exclaimed Justice Wilson. "What for." "To 'rest ye fur havin' ven'son in yer p'session 'ginst the law." The constable served his warrant. It had been sworn out by John Rollands before Justice Clark. 'Squire Wilson was taken before Justice Clark, where he waived examination and gave $100 bail to appear and answer the charge at the next term of court.

Three boys in Moultonborough, N. H., have this season shot 285 partridges, for which they obtained forty cents each, ten foxes, besides several mink and other game.

A GERMAN writer says one should every day read a fine poem, look upon an excellent picture, hear a little good music and speak a few sensible words. Esterbrook adds use his steel pens.—*Adv.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years **Humphreys' Veterinary Specifics** have been used by **Farmers, Stockbreeders, Horse R.R., Travel'g Hippodromes Menageries** and others with perfect success.

LIST OF SPECIFICS.

A. A. Cures Fevers and Inflammation, Milk Fever, Spinal Meningitis, Hog Cholera, 75c.
B. B. Cures Founder, Spavin, Stiffness, 75c.
C. C. Cures Distemper, Nasal Discharges, 75c.
D. D. Cures Bots or Grubs, Worms, - - 75c.
E. E. Cures Cough, Heaves, Pneumonia, 75c.
F. F. Cures Colic or Gripes, Bellyache, 75c.
G. G Prevents Abortion, - - - - - - - - 75c.
H. H. Cures all Urinary Diseases, - - - - 75c.
I. I. Cures Eruptive Diseases, Mange, &c. 75c.
J. J. Cures all Diseases of Digestion, - - 75c.
Veterinary Case (black walnut) with Veterinary Manual, (330 pp.), 10 bottles of Medicine, and Medicator, - - - - - - $8.00
Medicator, - - - - - - - - - - - - 35

☞ These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of $5 or more.

Humphrey's Veterinary Manual (330 pp.) sent free by mail on receipt of price, 50 cents.

☞ **Pamphlets sent free on application.**

HUMPHREYS HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

The American Spinner

The Only Size Made.

This is a new bait, having many advantages over the other styles of spinning baits. It is much stronger on account of the spoon being struck out of one piece of metal. It revolves very easily, and the red ball in the center reflecting on the spoon makes it very attractive to the fish. Its extreme lightness prevents its sinking and catching in the weeds; in short, it is the lightest, strongest, handsomest spinner in the market.

☞ Orders received from anglers residing in cities in which the dealers keep a full line of our goods in stock will not be filled at any price.

ABBEY & IMBRIE,
Manufacturers of Fine Fishing Tackle,
48 & 50 MAIDEN LANE, NEW YORK.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 14, 1884.

VOL. XXII.—No. 3. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

NOS. 39 AND 40 PARK ROW. NEW YORK CITY.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

LOADING AT THE SCORE.

AT several recent shooting contests we have noticed a careless disregard of the rule which requires that guns should be loaded only after the shooter has stepped to the score and is ready to take his chances at the trap. The marksmen instead put in the cartridge and then stand about with their weapons over the shoulders, or tucked away under their arms, or perhaps standing butt on the ground as the contestant sits waiting for his turn at the trap.

No habit can be more reprehensible than this. There is absolutely no excuse for it. The saving in time is insignificant, if there is any at all, while the chance of a mishap is so great that no one but the most reckless marksman would take it. There is some reason for carrying a loaded gun in the field where a snap shot may be called for at any moment, but even then the charge should always be withdrawn when there is a long tramp to be taken, a boat ride, or a wagon trip. The man who is careless of these minor points of safety on the trap grounds is generally a tyro. He is the greenhorn who thinks it clever to take risks, imagines it is a mark of experience when he puts himself above the rules of safety, and resents as an imputation on his ability to take care of himself any warning which may be offered

In rifle shooting the same difficulty presents itself—marksmen will parade about under arms. They seem to imagine themselves on the picket line in active warfare, or on the skirmish line with the enemy in view, and really careful shooters are put to no small nervous strain in watching the comings and goings of these dangerous fools. Often in shifting from range to range and from one firing point to another, the nonsensical freak of keeping a ball cartridge in the weapon is indulged in and frequently passes unrebuked.

There is but one way to meet this difficulty. It deserves a severe penalty and should receive it. It will not do to have a rule on the printed card and expect careless fellows to take the hint. They won't do it. They need instructions by object lessons, and the most effective one is to have a heavy fine imposed, or better still to have a clear and marked case of this fault drummed off the range for his act. The rule should carry with it its own warning. There should be no second or third trials for such an offense. The first act of omission should bring an emphatic rebuke from which there should be no appeal.

THE OHIO FLOODS.

EVERY winter and spring we hear the same news from the Western rivers. The Ohio and the Mississippi, with their tributaries, are swollen by the melting snow within their watersheds, overflow their banks and cause the destruction of millions of property and scores of lives. The floods come with regularity, and appear to be each year a little more destructive than they were the year before. The people who live upon the river banks, undergo their usual drowning, or washing out, as the case may be, and then after the floods have subsided, go about their vocations as usual. Subscriptions are taken up for the relief of the sufferers, the general government makes appropriations for their relief and spends money in building dams and dykes, which shall restrain the mighty streams and keep them within their banks. The annual lesson seems to teach nothing, however, to the people of the United States. These people are not usually regarded as fools, but how slow they are in appreciating the palpable facts that these damaging floods are a direct result of their destruction of our forest lands.

The snow falls now upon the land as of old, and the hills and fields lie beneath the pure white mantle for months. Then comes a warm rain. All at once the snow melts. Each trickling spring becomes a roaring brook, each brook a torrent, and the entire precipitation of a month or two is thrown, almost in a day, into the stream. This is large enough to carry off the water had it been gradually supplied, but when it comes all at once, the task is beyond its capacity, and the choked up waters rise, carrrying devastation and death to the surrounding country.

When the forests covered our land, it was different. The snow came then and lay among the great forest trees, beneath the spreading pine and hemlock, and the naked branches of oak and hickory. When the warm rain came the snow melted, but much more gradually. The freed drops did not then as now hurry down the hillside as if they hoped by a single impetuous bound to reach the sea. They trickled here and there by devious ways, and stopped among the mosses, and dived down into the crevices of the rock, loitered among the grass roots and soaked into the ground, for there were not then a million of their fellows behind them pushing them on with an impatience that knows no curbing. Then they could take their time, and they did so.

This week it is stated that Congress has reported a bill providing the appropriation of $300,000 for the aid of the sufferers by the Ohio floods. This is well. It is right to pay for damage done. But Congress ought not to stop here. Annual appropriations of hundreds of thousands of dollars for cure, and not a penny for prevention, is the height of improvident folly. How much wiser and more economical it would be to enact some intelligent legislation to provide the United States with a competent forestry commission, and then to give it money enough to carry on its work intelligently, wisely and liberally. Should we alone of civilized nations be behind hand in a matter which so deeply concerns the material prosperity of our country?

The fact that our country is a comparatively new one, and that until recently its forests have appeared to the short-sighted and superficial eyes of our lumbermen inexhaustible, seems to be the only excuse for the criminal laxity of legislators, State and Federal, in this important matter. It is time this supineness ceased. It is time that measures be taken to protect our citizens against losses such as are now occurring in Ohio, Indiana and Kentucky, and such as will a little later take place in those States which lie along the Mississippi River. The press and the people should take the matter in hand, and urge upon their representatives the needs of the country in this respect. We have preached the sermon so often and from so many points of view that it seems needless to urge it further.

Just at this time, however, we should think that the need of forest preservation would have presented itself very forcibly to those who have suffered in Pennsylvania, West Virginia, Ohio and Kentucky. Surely there ought to be some converts made from those States. Surely the representatives at Washington of these unfortunate people ought to be able to tell a moving tale, and to urge, from their own experience, the needs for forest preservation of at least one section of our country.

More important than the hardship which will result from the absence of timber for commercial purposes, and prior to it in time, comes the danger from floods. We are just beginning to experience this danger, and before the need for action is fully appreciated, no doubt we shall have to pass through a severe school of suffering. The dwellers in the fertile Ohio and Mississippi valleys will be the first to sustain loss, they should be the first to cry for forest preservation everywhere throughout the land.

A BILL INTRODUCED into the New York Legislature this week, and passed by the Senate, deserves the support of all sportsmen. Its provisions forbid the use of batteries in the pursuit of wildfowl on any waters within the State. Heretofore it has been lawful, in certain Long Island waters, to shoot from batteries, a practice which we now hope to see stopped. Really, it seems at last a if the legislators in certain States were beginning to have some appreciation of the necessity for game protection. The passage by the Pennsylvania Legislature of a law forbidding fowl shooting after Jan. 1, is certainly a movement which is as encouraging as it was unexpected. And, now that Pennsylvania has set the example, we may hope that New Jersey, New York, Delaware and the New England States will sooner or later, for very shame, follow the good example set them. The abolition of spring shooting is the first step toward the preservation of our wildfowl and shore birds, and when the importance of this change in the law has made itself felt, a long step will have been taken in the right direction. Let every sportsman do what he can to agitate this subject, and impress its importance upon his neighbors.

SKATES AND RIFLES.—The latest thing in target shooting is the skating rifle match. A target is set up on the edge of the pond or stream. Two lines are drawn on the ice, one ten yards above the target, the other ten yards below. The contestants, at given distances, skate across the ice, and when between the two lines, while skating at full speed, aim and fire at the target. This novelty has excited great interest in certain ice-bound districts. It is hardly necessary to call attention to the extreme caution which should be exercised in setting up a target of this kind. Firing is apt to be wild, and when a bullet has once left the muzzle there is no device yet discovered by which it may be recalled, even though speeding straight for a farm-house.

THE AVERAGE MAN takes the average dog into the field, talks to it in a way which presupposes on the canine's part a perfect comprehension of the English language. As a matter of fact, the dog knows very little English. Then when the average man discovers that the average dog does not understand all that is said, he straightway looks about for a club with which to beat his commands into the canine's noddle. The average man may with profit to himself and his dog read a communication on this subject in our Kennel columns.

THE "OFF-SEASON" may be very profitably employed. If an angler, one may practice fly-casting. The ice is a capital place for this. That is where some of the most successful tournament fly-casters found their training. If a gunner, this is a good time to experiment for determining the best way of loading, etc. Trap-shooters in many sections of the country have had ample opportunity for keeping their hands in.

DEATH OF D. C. SANBORN.—Just as we go to press we receive intelligence of the death of Mr. D. C. Sanborn, of Dowling, Mich. He died last week at Alamo, Tenn. This announcement will be received with sorrow by the very many friends of Mr. Sanborn. Few men were so widely known among sportsmen; no one was more highly respected.

NEW GAME LAWS.—We again repeat the request that our readers in different States send in the new game laws that are enacted this year.

A PIG IN A POKE.

ELSEWHERE appears a letter relating to remarks offered in these columns anent the anxiety of a certain Captain Lundborg to sell out a revolution in naval architecture to the United States, exact price not mentioned. We cannot understand why such a letter should have been addressed to us for publication. It contains nothing at all bearing upon the matter, and is weak in argument and logic. As a certificate of Captain Lundborg's good character it is superfluous, and as a technical indorsement of the proposed revolution, it is without weight because of its non-professional origin. If merely an attempt to advertise a customer, it calls for no further attention than to justify its appearance in these columns, lest the charge be laid at our door of refusing others access to the public. The communication in no way vitiates what we have said. Accompanying the same is the address of the "inventor" to Congress. This memorial is an unfortunate affair, being composed of loose generalities and stump oratory, appealing desperately to the "patriotism" of Congress to give the revolution a lift, and set it agoing with might and main. A discussion of the merits or demerits of Captain Lundborg's scheme is not pertinent at present. It would lead away from the principal question, nor can we concede to the scheme sufficient importance or prospect of success to call for further consideration. The point we make is a simple one. This is not a paternal government, engaged in helping along needy inventors upon the strength of a circular in which Washington, Jefferson, Madison and other eminent persons are made to figure as canvassers for a dubious revolution existing so far only on paper. There is ample opening for the use of all the capital of the country and more besides in the development of the Great West at more remunerative rates than can be expected from its investment in floating property in competition with the cheaper carriers of older nations.

There is, therefore, no reason whatever why Congress should hear the appeal of a vendor of nautical revolutions on "patriotic" grounds any more than similar appeals from the inventors of reapers, sewing machines or quartz crushers, any one of which has far greater and more immediate and tangible application to the country's needs, than theoretical improvement in the models of ships. If the memorial of Captain Lundborg should influence a grant of money direct or through the medium of experiments carried out by the Navy Department, an onslaught upon the Treasury might be expected from the lightning rod man engaged in the laudable and patriotic profession of protecting the valuable lives of American citizens in their homes; and the sewing machine agent would not be slow in setting forth his claims in behalf of the oppressed class of poor girls, whose capital in needles and thread would buy up our nautical interests several times over. The memorial of Captain Lundborg to Congress is nothing less than the entering wedge of a vicious system seeking the advancement of personal interests at the risk and expense of the community. The commercial marine of a nation is not to be restored by listening to the clamor of a few subsidy beggers nor by the purchase of a pig in a poke. When Captain Lundborg hints in his address that prosperity awaits our nautical interests in proportion to the action Congress takes upon his "invention," his address descends to positive burlesque. As we said before, this appeal to Congress is preposterous and should be promptly resented by a large negative vote should the supplication ever reach the dignity of a proposition before that body.

Let Captain Lundborg and his revolution float or sink in the world according to their worth. If his plans have half the merits claimed, private enterprise is quite equal to the task of testing and launching the innovation and is ready to eagerly grab an invention promising a monopoly to a great extent.

THE FLICKERINGS BALLOTS.

THE numbers are disproportionate. Twenty-one hundred and twelve ballots, and only seven prizes. The prize winners are to the others as 1 to 300. We can, however, hardly suspect of sordid motives every one of those who have thus cordially co-operated to make the Flickerings discussion so successful; nor do we believe that each of the 2,105 who receive no prize can be classed among those familiar and disagreeable personages we all know so well, the "disappointed exhibitors." There is one consolation—every vote helped to make the result what it was. And if any carper be found who neither voted nor acquiesces in the result, he has no one but himself to thank.

From numerous expressions, we have reason to think that the voting competition has afforded pleasure to our readers. Indeed, the "scheme" has been so much more cordially received and acted upon than we had anticipated, that we have almost determined to repeat it another year. If that be done, there will be certain modifications of the plan. These will be stated hereafter; perhaps next week.

Herewith is presented the final report on the vote. Last week we announced the winning stories. To-day we give the names of the winning voters and their ballots.

It was explained in our original announcement of the conditions of the competition that the winning ballots would be those which showed the highest aggregate of story credits. This is only another way of saying that those ballots would win which should come nearest to the choice of all the voters.

The relative merits of the ballots have been determined by an addition of the credit units belonging to the several stories on each list. The highest possible total of credits would be reached by a card containing (without regard to order) the ten stories which received the highest scores of credits; that is, Nos. 36, 53, 31, 45, 93, 37, 42, 10, 33 and 20. (See table of first fifteen in last issue.) This highest possible is found to be 39,272. The winning ballot, as will be seen below, has all of the winning seven stories, and sums up the remarkably high score of 37,814.

We give the detailed scores of the first ten ballots. Of these the first seven are the prize winners.

	List.	Credits.	Total.
First—Mr. J. A. Crisp,	93	4,017	
(Address, Jefferson, Ohio. Card mailed Jan. 19. Mr. Crisp writes: "Here goes for first prize.")	36	5,423

By reference to the list of winning stories in our last number, it will be seen that the writer of the first prize ballot named all of the seven prize stories; the second writer named six; the third, six; the fourth, seven; the fifth, six; the sixth, six, and the seventh, five.

That each voter may count his or her own ballot, we subjoin a complete list of the credits given to each story of the ninety-six:

*No. 7. By transposition of the 6 credits and the 7 credits in the table last week there was an apparent increase in the score of No. 7. The total is 2,821.

†No. 36. By the omission of a 10 credit in our table last week, No. 36 was credited in the first line with 1,300, when it shoud have been 1,310. The total 5,423 was correct.

The Writer of No. 36.—By mistake in our address book, we assigned the authorship of the story No. 36, to the wrong man. Last week we asked the writer to send us his name and address. We now repeat the request. The writer of story No. 36 will please make himself known, that he may receive the prize book now awaiting his order.

The Sportsman Tourist.

BETWEEN THE LAKES.

Fourth Paper.

HUNTING AND FISHING.

HE who sits down to write a history of events engaging his fancy, is apt to find himself lingering in the by-ways of his story longer than was his original purpose. He is like one meeting for an evening, after years of separation, an old and dear friend of his youth. There is so much to talk about, so much to tell and hear, and so short a time for it all. Here am I, charged with the task of recording the history of the summer rambling of the Judge, the Greek Professor and myself, and there is so much that I could write and so little room for it all that I hardly know where to begin or where to leave off. Why, a good-sized book would not suffice for it. This is the fourth paper of the series, and yet I have scarcely begun the story of the pleasant camp life we led on the Ahmeek-we-se-pe.

Ah! how sweet the recollection of these forest and stream experiences are! Here I sit by my fire with my feet on the fender and the wintry winds without moan at the gables and roar in the chimney throats, and the snow whirls around the corners and drifts into heaps, while I, scarcely conscious of it all, dream of soughing winds in pine trees, of blazing camp-fires, of leafy woods, of wimpling streams, of leaping trout. Howl, ye boreal winds, and pile up, ye drifting snows, I go a-fishing this very night.

Where am I? Yes, the Judge killed a deer and he came into camp with it on his back, looking for all the world like the pictures of the hunters familiar in my boyhood days, only the Judge did not wear a 'coon skin cap and his gun did look as long as did the old hunters' guns in the pictures. This exploit of the Judge occurred some days after our trip to the Seven Mile Creek, and as our venison had been out a good while, and trout were not so easily taken as at the first, it came when most needed. Our two hunters had been hunting industriously for several days. The Greek Professor had made a salt lick on the plan suggested to him by Captain Jim, and while he watched his lick, the Judge took to the small lakes, and finally success rewarded his efforts. His deer was a small one, and for a near-sighted man, the shot was a good one. He put the ball through its heart, but we never could quite make out the distance he was from it. The Greek Professor quizzed him as closely as he would a conceited boy with a bad lesson, but about all he could learn was, that the Judge had abandoned his boat and was in ambush on the shore. He was very particular in his description of its manner of running after it was shot, and the exact spot where he found the first blood, but as to his distance from it when he fired, not a hint would he give. The Greek Professor pointed out to me a blemish in the color of the hair surrounding the bullet hole and suggested that it might be powder burnt, but we finally decided that the blemish arose from some other cause and gave up further inquiry.

Soon after establishing our camp, tracks had been discovered in the vicinity which occasioned some controversy. I think it was the Judge who saw them first, and he reported them as being a dog's tracks, but the Greek Professor scouted the idea and said they must be wolf's tracks. Not long afterward the Greek Professor himself saw them, and in turn he reported that they were dog's tracks, and it was now the Judge's turn to scout the idea, and he was not slow in doing it either. "Why, it is preposterous," said the Judge, "to suppose them to be a dog's tracks. We are nineteen miles from civilization and no dog would ever wander this far. No, they are wolf tracks!"

Not long after the question was settled by seeing the animal that made the tracks. We were returning from Beaver Lake, and as we emerged from the thicket into the belt of Norway pines that crowned the bluff on which was our encampment, the Judge exclaimed, "We have visitors! See that dog!" Sure enough, there was a white and brindle spotted, medium-sized dog, busy picking up such scraps as he could find around the camp. Before we had gone many steps nearer he heard us, and giving us one quick, surprised look, he ran swiftly to cover under some brush, and we never saw him more, nor were dog tracks seen any more.

No visitors had come, and it was quite evident that the dog was out on his own account. The number of times we had seen his tracks indicated that what he considered his home was in that neighborhood, and as four dogs were reported to be running wild in the Jeromeville region, twenty-one miles straight across the country, we came to the conclusion that probably our dog belonged to that pack.

The Indians told us that south of Beaver Lake a couple of miles, trout of large size and in great abundance could be taken, and to verify their statement we made an exploration of that region. Part of the way we traveled over picturesque hills and hollows covered with a magnificent growth of hardwood timber. Then we came to a cedar swamp through which ran a spring brook, in which were a few small and exceedingly dark-colored brook trout. After crossing the swamp a level region bearing mostly pine timber ensued, and then we came to the stream which in a former paper I have ventured to christen the Pau-Puk-Keewis, for reasons there set forth. We did not find the large trout the Indians said were there, but we did find small ones, and they were quite plentiful. I am inclined to think, however, that we omitted in our explorations the most important part of the stream. Had we followed it down to a point nearer the lake we might have found the Indians' big trout. Be that as it may, the Judge and the Greek Professor set out for a visit to the Pau-Puk-Keewis one day, and there occurred an event of such importance as to require a careful narration. While I was not with the two men on that occasion, yet I heard the story from the lips of each of them so often, and told with such a degree of minuteness, that I think I can enter more into the spirit of the affair than if I had been an eye-witness to it myself.

At rather an early hour the two set forth on their journey. Their purpose was to cross Beaver Lake and tie up their boat on the south shore, and cross over to the headwaters of the Pau-Puk-Keewis and fish down that stream. For some reason, however, they did not row straight across, but turned up the lake toward the southeast, and when they reached the shallow water they went to fishing. Not meeting with any success, they set their prow westward and moved slowly down the south shore. The Judge is quite skillful in the use of the steering pole, having learned that art in river navigation. He was standing in the stern of the

boat pushing lazily along while the Greek Professor, seated in the bow, was casting ahead, zealous to catch something, he cared not what. Finding himself unable to throw out as far as he wished, while seated in the boat, he rose to his feet and began casting. This rendered the boat difficult to manage, and the Judge thereupon said as much to the Greek Professor, who kept on his casting but taking nothing. Two or three times the Judge hinted the difficulty, but the Greek Professor gave no attention to the hint. Then the Judge's ire arose, and he resolved to throw the Greek Professor overboard. He had given two or three little side movements in order to test the force required to make successful the experiment, and had planted his pole and braced himself for the final quick and strong side push, when his right eye caught a glimpse of a deer stepping down into the water. I say right eye, because he is so very near-sighted in his left eye, that he does not pretend to see with it any such distance. At once the Judge resolved not to throw the Greek Professor into the lake just then. "I see a deer ahead, and if you will sit down amidship, I'll push this boat within gunshot of it." It required nothing more to get the Greek Professor down as indicated, and with the shotgun across his knees. And then the Judge bent to the pushing pole, and the Wawa shot through the water as straight and as noiseless as a pike.

"Where is it?" asked the Greek Professor. "I can't see it."

"No," said the Judge. "Some people never can see game. It has moved behind some brush, but will come out in a moment."

And the Wawa fairly leaped along in silence, leaving a long and widening trail behind her.

"There, now!" said the Judge in a low tone. "It has stepped out, as I said it would. See, it looks all around—don't move a finger." And he stood as motionless as a stump, and the Greek Professor sat likewise. And then the deer lowered its head and again the Wawa shot forward, and by this time the Greek Professor had his gun to his shoulder.

"Don't shoot yet," said the Judge, "you are too far!"

"No, I'll not!"

And nearer and nearer the little boat drew.

"Must I shoot?" whispered the Greek Professor.

"No, not till it looks up again," was whispered back to him.

And the setting pole was lifted from the water without noise and a new foothold taken and the Wawa sent still nearer the unsuspecting victim. It turns its side to them and lifts its head.

"Now!" is whispered.

Bang!

And the deer drops in its tracks.

"A center shot! Where did you aim?" asks the Judge.

"Right at the fore shoulder," answers the Greek Professor proudly.

"My conscience!" exclaims the Judge in well simulated surprise.

"What is it?" asks the Greek Professor in evident concern as the Wawa moves up to the prostrate deer.

"Think of the consequence had you aimed at its hind shoulder!"

"Oh, fudge!"

The deer was lying in shallow water, holding its nose out. Both the men leaped out, and, giving the boat a push, it was run ashore.

"Lay hold of it," said the Judge, "and cut its throat."

"I can't do it," said the Greek Professor, whose savageism had gone out with the shot he had fired and whose tender-heartedness had returned. "No, I can't do it; you must do it."

"Well, then you must stop shooting at deer."

And the Judge laid hold of it, and, dragging it to the white sand, he thrust a knife into its throat, and as the warm blood spurted from the gaping wound and a film came over its eyes, and its under jaw relaxed and it gave a dying struggle, the Greek Professor said, "Poor thing! Poor thing! I wish I had missed!"

"I can believe you," replied the Judge, "I don't think I ever killed one in my life that I saw die but I was real sorry that I had hit it. I remember that I once shot at a deer and broke its back while it was standing on the river bank, and it fell in and swam around, using its forelegs. A friend was with me—a capital good fellow he was, and as tender-hearted as a woman, and he cried like one, too, while I was killing that wounded deer; and I am not right sure but I cried myself. And I felt real mean and sneaking all day after. The truth is, I couldn't eat the venison and we gave it away."

"Well, then, what makes you kill them?" asked the Greek Professor.

"What made you kill this one?" replied the Judge. "You have been crazy to kill one ever since you have been in the woods. You feel just now as if you would never kill another, and I don't think you would go very far out of your way to kill another one to-day. But to-morrow, or the day after, you will have forgotten all about this poor, pitiable thing lying dead here, and will be more anxious than ever before to kill another. Why do we kill them? Well, a very few hundred years ago our ancestors got their living mainly by hunting, and I guess we have inherited a good deal from them. There is where I fancy I got my love of deer shooting. But let us see where your shot struck."

And they turned the carcass over expecting to find the region of the heart riddled with shot, but not a wound could they find there. Then they examined other parts of the body and finally they found that one shot had struck it plump in the top of the head.

The deer was a small one—a yearling doe, but its flesh was all the sweeter and tenderer, and although the Greek Professor was heard to say, "If it only had been a big buck!" in a lamenting tone, yet after he had slept over it he was as proud of his achievement as if it had been the biggest buck in all the woods.

Notwithstanding the luck of the morning the Wawa was hauled ashore and the trip continued to the Pau-Puk-Keewis, and the remainder of the day spent wandering up and down that stream, the seat of an ancient beaver empire made famous by "The Song of Hiawatha."

On their return to camp, tired and hungry, but in high spirits, toward night, they were unexpectedly met by Ed. Cox and Ira Weller, who had come to the Ahmeek-we-se-pe for a two days' fishing, and who had brought letters from home—the first we had—and also a further supply of sugar, flour and baking powder. Their experience as woodsmen and campers-out led them to conclude that "about this time we were beginning to run short of these substantials," and their conclusion was correct. D. D. BANTA.

REMINISCENCES OF THE NORTHWEST.

MY FIRST BEAR.

HAVING decided upon a few years of border life, the time of departure drew near, and many bright anticipations of hunting and fishing exploits ran riot in my brain during my contemplation of the coming change. I remember during a short stay in New York, just before taking the express for the West, how many well-wishers there were who joined me in painting the bright hope-picture of the mighty West—what lots of hunting, and what countless numbers of trout of any imaginable size were destined to become my prey.

Had I a good gun? Was it a Greener? Or what had I considered best for such a hunting prospect? Whatever make, it could hardly be good enough. But a light gun would hardly do; I must certainly have a rifle, for it seemed the slaying of buffalo, deer and grizzlies would unquestionably form a large part of my future occupation; and among the many brilliant suggestions advanced with a view to meeting this emergency, that of an "express rifle" calculated to express something like a quarter of a pound of lead was not wanting. All this resulted in the purchase of a Ballard rifle before leaving, with the ostensible object of slaying the antelope and buffalo of the plains, as the trains of the Union Pacific flew past their numerous herds. With notions like these I started for the frontier, and it is barely necessary to add that the Ballard was disposed of to the first purchaser after reaching my destination, with, of course, the unfailing recommendation that it was really a new gun and had never been fired.

I think it was something over a year after my arrival in the West that I had occasion to use a rifle, and by that time I had learned that one of Uncle Samuel's Springfield carbines was about the best thing for all uses there was to be had in that line. After a great deal of wing-shooting and deer hunting of various sorts, a trip into the mountains was under contemplation which gave unusual promise of bringing some of us at least within range of a genuine live Rocky Mountain grizzly; the climax of the hunter's joy.

But, alas! for the vanity of human hope, day after day, and week after week took its place in the ranks of the past and the bruin of our dreams still remained a "vapory conjecture," a "mere figment of the intellect."

At first I always carried a rifle when going far from camp alone, until day after day proclaimed in stronger terms the unwelcome truth that there was really no immediate danger of being devoured, and this weighty consideration added to the fact that all kinds of small game were plenty—particularly grouse and birds of every sort as well as small deer that could be killed with buckshot from a shotgun—resulted after a short time in my going abroad customarily armed with a very ordinary eight-pound fowling piece, the shells charged with sixes and eights; two or three reserve cartridges being loaded with buckshot for an occasional deer. So passed the days with birds and venison in profusion for the entire command.

A short march, making camp by three in the afternoon, was generally the order of the day, and this left several hours for hunting before dark, while an early rise in the morning gave ample time for a few casts in the brook before breakfast and boots and saddles. After weeks like this, anything more than a small black bear was reckoned among the possibilities but hardly among the probabilities of the future of our trip. Bear tracks were not uncommon on the trail, but they seemed to be out of the way in the day time, though now and then a small black bear would be seen early in the morning, which at sight of us would take to the hills or the timber, avoiding our approach.

The object of our trip had been accomplished, we had joined another command scouting in the same section, and we had already turned our course homeward. Great had been my eagerness to ascertain on joining the new command if Lieutenant P. while separated from us had succeeded in getting a bear, and equally great was my gratification in learning that my luck was not exceptional, and that he had been no more fortunate than I.

We were within a few days of our return, when a pleasant afternoon found us encamped on the banks of a mountain stream at a point where, leaving the hilly cañon it found its way through a pleasant meadow. We had had about hunting enough; Lieutenant P. was still sanguine, but in our conversation on the subject while sitting about camp awaiting the call to supper, I remember having strongly deprecated the hunting resources of the Territory. I did not believe there were any more bear in the Rocky Mountains than there were in the Adirondacks, while the former range covered vastly more ground, as a result of which I contended in the strongest terms that there were more bear to the square foot of land in the East than there were in the West, and that there was much nonsense, if not actual fraud, in the reputation the West enjoyed for hunting facilities. I did not expect to meet any bear at all events, and if I did, I had that confidence in my shotgun that I should simply shoot him with one barrel in one eye and then with the other barrel in the other eye, after which I should proceed to fall upon him and whittle him up with my jack-knife while indulging in a wrestling match just as I had frequently seen it done upon the stage. This sort of talk was interrupted by Johnny the scout, who had just reached camp, and came to inform the Loot'nant that he had discovered a deer lick a short distance from camp with fresh signs about it, and that a deer could probably be taken with little trouble by going to the spot about sunset, as they customarily came down to the licks at that time for water.

After supper we lit our pipes and at the suggestion of Col. B., who said our larder was getting low, I expressed my willingness to take the deer whose visit at the salt spring was contemplated. Lieutenant P., from disinclination or other cause, did not care to go along, but in his habitually gentle manner ventured a few predictions adverse to the results. I had somehow acquired, with him at least, the reputation of being a rather desultory hunter. I didn't propose to get more than one deer anyhow, so I picked up the first carbine that came to hand, and taking three cartridges from the nearest belt of the many that lay scattered about the ground, I shoved them somewhat carelessly into one of the pockets of my hunting coat and left the camp, pipe in mouth and gun in hand, thinking my smoke might as well be finished at the deer lick as about the camp-fire, with the additional prospect of a fresh steak for breakfast.

It was only a few hundred yards to the lick, a beautiful spot to while away an hour and watch the setting sun. A half hour soon passed, my pipe was out, and with it my reflections took a turn. Lieutenant P. might yet be right, the prospect that I should return empty-handed was certainly better than it had been and was visibly improving every minute.

No rustling in the leaves, no sign of game beyond the cañon, whose dark gorge was fast fading into the gloom of twilight. Certainly this would not do, if the deer was coming down I might hasten matters somewhat by meeting him half way; besides I would feel better for the walk and might possibly save my reputation as a hunter.

There was little of interest on the cañon trail. I drifted along over one little rise after another, and now and then climbing over some large pine trees that had fallen across the trail. I had gone some little distance without interruption, the trail became narrow, winding along the side hill some fifty or sixty feet above the white waters of the mountain stream; to the right and left the steep declivity of slide rock precluded the possibility of climbing. As I sauntered along gun in hand my gaze had been directed to the ground for some minutes, when suddenly without apparent cause, I looked up along the trail. Heavens! Could it be true, or did I dream? The largest, fiercest, ugliest creature I had ever seen, stood—no, I wish he had—was leisurely walking straight down the trail toward where I stood leaning against a tree trying to collect myself and realize the immediate and terrible necessities of the situation. His ponderous paws came down with monotonous pat, pat, pat, that seemed to fairly shake the ground, for he wasn't more than forty yards away.

I shall never live to forget the sick feeling that first glimpse produced. His heavy plodding carriage seemed to say with the swiftness of thought: "If you are standing there when I arrive I shall walk right through you. I'll eat you up, and I'll use your miserable old pop gun for a toothpick, and it wont bother me any more than breathing so much air." This was about all I felt in addition to the sense of ultra fierceness that grizzly's whole appearance seemed to wear, his little small eyes, scarcely visible, his ponderous feet and a sense of massive weight as he came plunging down the hill, all combined to produce that sense of utter goneness which is only known to those who have been once thoroughly and awfully scared. Here, then, was what I had been looking after for weeks. This was what I thought the country needed in order to meet the expectations of its friends; here was the grizzly bear that I wanted to shoot, blind with pepper shot and cut up with a penknife.

While all this was passing through my mind I was fumbling about in my pocket for one of those miserable three cartridges I had so carelessly tucked away, and I hadn't much heart in what I was doing, either. I didn't know for certain whether or not 'twas best to ruffle his temper with foolish and trifling demonstrations of courage. I would have liked to swap my carbine for a Gatling gun or a mitrailleuse, in fact anything seemed preferable to the situation I was in. All this time the bear was coming right along; it seemed as though I was unconsciously counting his steps while fumbling about for that cartridge and getting it into the carbine. At last it was there, the hammer cocked, and, with steady rest against that little pine tree, I pulled the trigger on grizzly bruin. The smoke passed away, and "oh, horror!" he wasn't dead at all! He was coming at a run, and only had thirty yards to run if I stood where I was. It was too much for human fortitude. If there had been anybody round to laugh at you it would have been different, but there wasn't. What I thought I don't quite know. The next recollection I have I was running down that hill about as fast as my legs had ever carried me, and calling loudly for "Johnny," the scout, who I suddenly recollected had told me on leaving camp that he should come up to the spring after finishing his supper.

As will appear later I had unfortunately made myself heard before I could collect my senses sufficiently to realize that I was actually running from a challenged enemy, and what might Col. B. and Lieut. P. say could they see me in this predicament. I think it was this sense of humiliation that overcame the effects of the fright with which that bear's sudden appearance had inspired me; at all events I managed to get one of my two remaining cartridges into the gun, stubbornly faced about and not caring a cent whether bruin made a square meal off me or not, I coolly drew another bead on that bear and fired. It was evidently the work of despair; the smoke cleared away again and it would be hard to describe my gratification at seeing my grizzly rolling heavily down the hill like a barrel of pork, bounding from one stone to another until he took a final plunge into the mountain stream that rushed along the gorge below.

Another shout to "Johnny," this time a call of triumph, and the next instant I was scrambling over the slide rock down to where bruin lay. The complete reversion of feeling produced by seeing my formidable victim rolling apparently inanimate down the hill was too much for my sanguine nature; it never occurred to me that he might not be dead, and that the gorge was not a very nice place after dark even when no bears were about. My eagerness knew no bounds; one careless step after another, and half way down the hill, I found my motion uncontrollable; the slide rock had got started and it would not stop. I must go with it. Another second and splash! up to my waist in a cold mountain stream full of rocks and boulders; but what was infinitely worse, a glance up the stream brought back all the horror of my first sight of bruin. There, not more than ten feet up the stream from where I stood, was bruin, wounded and plunging about in the rocks and water, whose swift current continually disturbed his footing and urged him a few feet nearer me. Though wounded he was apparently as well as ever, and evidently intent on reaching me, in which he was greatly favored by circumstances.

I think the cold water of the mountain stream brought me to my senses somewhat. At all events it didn't take me long to find my third and last cartridge, my forlorn and only hope; should it fail, there remained nothing to do but to take to the stream and chance it with the rocks to the mouth of the cañon. By the time I had got it into the gun bruin was about two yards off. In the coolness of despair I pointed the muzzle to his breast and pulled the trigger. Bruin fell from his erect position against the bank into the water and floated to my feet. His head was under the water, and by the time he reached me he had breathed his last.

Johnny had heard my call, and the discharge of my last shot had indicated my whereabouts to the amazed bystanders on the hills above. "Hooray! Hooray! Bully for the loot'nant! Golly, it's a big one!" "Sling him a rope!" and many similar expressions, told how lustily I had hollered some minutes before.

Ropes were procured, and Mr. Grizzly, the first and only bear of the season, a fine five-hundred-pounder, was floated down the stream and hauled into camp with the honors of war.

We had another supper that night and after it a long talk, in which the bear was killed a half dozen times over, and after it all Lieutenant P. was hearty in his sincere, though somewhat unanticipated, congratulations.

WINTER FIRESIDE THOUGHTS.

FROM boyhood I have always loved to sit before the fire and let my thoughts stray at will, and the habit has so strengthened with years, that to-night finds me in the old place, indulging in fireside fancies with as much enjoyment as ever. It has been a very dull day; there was something in the air that seemed to depress one, the still atmosphere indicating snow. Even my little friends the snowbirds were not in their usual good spirits, but twittered in a chill, comfortless tone, as they rummaged about among the spruce and arbor vitæ, and the scrunch, scrunch, of the gravel under their feet seemed to voice the general depression reigning in the outside world. But here we are at last before the grate, the lights turned out, doors shut, curtains drawn, and only the dull red glare of the coals to keep company with our thoughts. How complete is the satisfaction to sit here in the silence thi stormy night, and listen to the swirling gusts outside as they dash the little snow fairies in a mad race through the air. One can imagine he hears the beat of their tiny feet against the window panes, and their complaint as they drive off again in the darkness.

The heavy curtains seem instinct with life, and now and again sway forward, as some furious blast forces a little of its wild nature between the sashes. The wind rose gradually; a long drawn sigh which swept up the chimney gave the first intimation that the wild uproar now raging without was about to begin. The fire is burning slowly down, and now and then settles with a husky little murmur, while little spurts of pale blue flame run about over it in response to the intermittent draughts as the gale roars around the house. The lights and shadows play through the room, and touch here and there upon the forms of many of my specimens, each one bringing to mind the scene and incidents of its capture.

There on the bookcase sits an immense snowy owl, the pride of my collection. His wings are extended, and his great yellow eyes gleam in the fire light as he bends slightly forward as though about to dash at me. He met his death one bright October afternoon in this wise: It had been too warm and calm for shooting, and about two o'clock I voted to take up the decoys and return to the shanty. While quietly poling along in my punty, I espied his lordship on the marsh some distance ahead, and made up my mind to stalk him if possible, so carefully shoving into the sedge, I crawled ashore. Finding concealment was out of the question, the meadow grass being too short, I rose and walked slowly toward him. He was sitting with his back to me, but with that quick twist which only an owl can give and not dislocate its neck, he turned his head and looked back at me directly over his shoulders, those fierce eyes of his glaring at me (I must confess with more expression than now), from out their circle of snow white feathers. His bill was snapping like a pair of castanets as I approached until nearly within gun shot, when he spread his great white wings and with his head still turned toward me, seemed to be awaiting my next move. Pausing a moment I enjoyed the picture, only for a moment, however, for with a bound he started at once into the air. I turned loose both barrels almost on the instant, although with but slight hopes of grassing him at such a distance. As luck would have it, a single pellet cut the tendons of his right wing close in to the body, causing it to double back, and down he came with a rush. Without stopping to reload my gun I ran toward him, but to my surprise (I cannot say delight), he advanced to meet me with a series of gigantic flops which soon closed the little space between us, and before I could strike him he had me, driving his long black talons through my overalls and deep into the heavy wading boots underneath. After a short but careful skirmish I managed to get hold of the tips of his wings, and soon secured the old fellow under the hatch of the punty, where he vented his rage in shredding the strip of oiled canvas rent from my overalls in his first onslaught, and wickedly clutched in the struggle that followed.

But are those eyes bent on me? As I follow the direction of their glances, I see the form of a green-winged teal cowering close in the dancing shadows. Pretty little fellow, he was stopped on his way south one autumn, he was such a little jewel of a duck, and those sturdy little wings of his slipped him along so fast that he had nearly escaped me.

The dusky form of a coot (crow duck, blue peter or whatever you will, gentlemen) stalks close beside the big owl. Not because I especially admire this specimen did I preserve him, but his form reminds me of how often I have lost patience with these same blue peters, as they rafted by thousands just out of shot, luring the fowl from my decoys.

Across the room, almost indistinguishably in the gloom which surrounds him, stands a huge black-backed gull. I killed him in a driving snowstorm, and well I remember what a prize he was. He undertook a short cut across the point on his way down one evening, and the rest of his story was told by the happy lad who with numbed fingers gathered him in. Other feathered beauties there are around me, some of them bringing up thoughts of the fragrant woods, and again in imagination sweet notes ring out from their graceful throats.

But time has flown with our reverie, and the little people who live in the soot on the back of the fireplace have lighted their lanterns as the fire dies, and we see them traveling back and fourth in the dark, and now, the last one having put out his light, let us take the hint so prettily given and ourselves retire. WILMOT.

MAJOR JOSEPH VERITY.

SOME OF HIS SPORTING ADVENTURES, AS MODESTLY SET FORTH BY HIS OWN HAND.

Chapter VI.

IF any who has been interested in the plain unvarnished accounts of my experience has wondered that I have not continued them, I can only say that I have suffered the common lot of all earthly things; in short, have grown old. I find it difficult to remember with sufficient distinctness the events of my past life to record them with that accuracy of detail and strict adherence to truth which above all things I prize. Particularly in this respect do I find myself embarrassed concerning those things which have occurred since I have approached and passed the period where it was ordained that the days of man should end. Of them I write with hesitation, though what I saw and was a part of in my prime is as vividly impressed upon my mind as these words upon the page before me; and furthermore, concerning such matters of the long past, I feel that I have not fallen into the common error of age, which is to exaggerate the exploits of youth, and magnify the wonders of bygone times. If of late affairs I seem to the readers at times to verge on the improbable, though never I trust on the impossible, I can only beg of him to remember and bear with the infirmities of an old man's mind. That better part of us must fail with its fleshy tenement till it shall leave that poor abode and enter a new one, not of flesh or earth. When I look upon the hand which pens these lines, a withered member over whose bones and nerveless sinews the dull blood runs in its ridged purple course, I can hardly believe it the same that forty years ago could crush the sap from a maple limb, till I see the scars that a panther throttled by it made in his death struggles.

Speaking of panthers reminds me of a singular incident of which I was a witness. It was on the borders of a wild lake in Adironda, where, with a companion, I was hunting and trapping one fall. I had left our camp early one morning to go down to the lake to hear the fishes sing, as in that water a certain kind that I have never seen elsewhere are wont to do. At daybreak or thereabout they would thrust their noses above the surface and begin in concert to trill forth the most melodious song that I ever heard, and continue it for half an hour, and sometimes longer. The sweet strains seemed to attract insects from all the surrounding forest, and as they hovered close to the surface, apparently entranced, the fish would devour them in incredible numbers, some of the fish all the time keeping up the spellbinding melody. Such singing of fishes I have read of as occurring in the depths of the sea, as might naturally enough be where mermaids inhabit, but I never heard of nor heard them in fresh water except in this one lake. My companion held that these were frogs, which, as all know, do sing after their fashion, but when I caught one of the singers with a fly, and a song in his throat, some of which leaked out after its landing, he was convinced. As I neared the shore on this particular morning I heard an unusual rustling of the fallen leaves close by me, and stopping behind a great tree, I presently saw a young panther busily chasing its own tail, just as we see our domestic kittens often doing. I was much interested in the pranks of this little pup of the woods, and kept quietly out of sight, watching him pursue the appendage which seems to have been given to the cat kind merely for ornament and the plaything of their youth. I questioned myself, What do little lynxes and wildcats do, who have no tails worth following? Surely nature has not been so kind to them as to their larger cousins. But presently I was inclined to think differently, for my little performer being somewhat rough in the handling of his toy, gave it a prick with his claws, which enraged him, and getting the tip of his tail between his jaws, he gave it a savage bite, and then his fury increasing he bit and swallowed the whole of it quite to its roots and even inflicted some ugly wounds upon his hams, and he continued his attempts to swallow himself till he was actually strangled by his own tail. Feeling assured that his mother was not far off, I quietly withdrew to camp and got my rifle. Returning to the spot I found her trying to unravel her unfortunate offspring. A well directed shot put an end to her grief and her life, and I dragged the two panthers to camp, the hooped kitten just as he had died, to show my companion and convince him that it had come to its end on both its ends in the manner related. For my friend was a doubting Thomas, and sometimes inclined to question the accuracy of my statements, and yet he told tales of his own adventures, which were borrowed. One I remember, of his hunting on this same lake, when he lost his powder horn overboard, and his comrade, who was an expert diver, offered to go down and get it, and after some remonstrance did so. He was gone so long that my friend became alarmed and went down in quest of him, when what was his disgust to find his unfaithful companion sitting upon a rock on the bottom, pouring the powder from the lost horn into his own. Now this is an ungestionable fact, but it happened to another man than this companion of mine, namely, to my friend John Burt of Essex, of the county of that ilk in the State of New York, and not in this little lake, but off Split Rock in Lake Champlain. I have lately seen this story going the rounds of the papers as having happened somewhere out West, which appears to be the home of big stories as well as of other big things.

Our trapping in this little lake of the singing fish was very successful, especially in the taking of otters, animals which greatly abounded there at that time. Our method of capturing them was devised by us, and it was done by setting a very sharp one-tined spear in the deep water at the foot of their slides exactly in a line with their course down them. Speeding down the slide one after another with prodigious velocity, it was not uncommon for as many as four otters to be impaled upon a spear, one on top of another. I never knew the name of this lake, but it lies not very far from the fountain of condensed water of which I have told, and which I trust the thorough survey of the region now being prosecuted may bring to light, as well as the tunnel through the world up which the monkeys come. I have written to Mr. Colvin, giving him all the information I can which may guide him in his search for them, and hope it may be his fortune and that of many another to see what I have seen.

ADIRONDA, January, 1884.

MR. NICHOSON'S BUCK RIDE.—A recent account, in the reckless style of the newspapers of the "Rockies" whose yarns are usually in accord with the size of their mountains, relates how an old hunter was involuntarily treated to an elk ride, "forty miles, if it was one," which forsooth was a most invigorating shake up for the old chap—if true. However that may be, the incident of Nichoson's buck ride, a strictly true occurrence, is herewith presented. Mr. Nichoson was residing in Naples, Ontario county, N. Y., some forty odd years ago—a period in which there was yet existing in Western New York a large extent of forest and a corresponding fair share of wild game. One winter day while engaged in drawing wood a large buck, pursued by hounds over hard crusted snow, was run down by them in the road only a short distance from Nichoson, who hastened to secure the creature, and straddled its neck with intent to cut his throat. While reaching down to get out his knife the buck suddenly arose, leaving Nichoson's legs firmly secured under his antlers—then with his hoofs he clawed into shreds the back part of his rider's pants and split down his boot legs. The buck, finding he could not get rid of his rider, then treated him to a vigorous good-sized buck trot of nearly a quarter of a mile, and, perhaps like the famous cork leg of Mynheer Von Waldegg, would be running yet, had not Rob managed to stop the wild career of the antlered steed by cutting his jugular with a knife. The effects of the "hoof raking" and this rough ride was a lameness unfitting him for work for several days. Mr. Nichoson has long been famed throughout this region as the veteran fox hunter, and, although a cosmopolite of leisure and well along in years, is yet an inveterate sportsman, pursuing the glorious pastime with rifle and hound at frequently occurring intervals.—PIPER.

Natural History.

THE EGRET.

WHILE inditing my note of last week about the bittern my mind reverted to an acquaintance I once formed with a distant relative of that family. I was spending the summer as usual on the banks of the Manasquan (New Jersey) and one day found myself lying on the beach sand watching the natives who were engaged in the sport of "squidding" for bluefish. I had pulled one or two across the sands, but found the exercise too violent for my feelings. Happening to cast my eye inland I saw across the meadows, a mile away, a flock of some white birds circling in the air. I called the attention of some of the fishermen to the matter and was told that it was a flock of white tame geese owned by one of the cottagers. The explanation did not satisfy me, and in a few minutes I had the sail of my batteau up and was wending my way through the creeks to the spot where I had seen the birds go down. Taking a circuit I reached a clump of woods that at that point skirts the edge of the meadow, and crawling through the brambles and Indian grass I found myself in easy range of a flock of the most beautiful and graceful game that I had ever seen. There stood, feeding in the meadow grass from which the tide was just falling, sixteen small white herons, grouped and posed in a way that would excite envy in the breast of a decorator of Japanese screens. I say "small" but I must confess that from my point of view and in the excited state of my imagination, they looked to be as large as cranes. One with each barrel was the result.

Oh, if I had only then known what a Parker was, but noticing that the flock did not seem inclined to leave the vicinity I hurriedly propped the dead birds on the stalks of a hollyhock and, retiring to my blind, soon had them again in range with a similar result. Another wait gave me another pair, and then I was content to see the balance of the flock sail away. The birds were the egret, I think the *Ardea garzetta*, and while I am about it I may as well say that their flesh was nearly as white as their feathers, and was pronounced by all who had the privilege of tasting it to be tender, juicy and finely flavored. Their plumage was as near pure white as could be, excepting a dove-colored tint beneath the tip of the longest wing feathers. I need not say that these wings were eagerly sought for and appreciated by the ladies at the hotel, and their gratitude for the additions to their millinery possibilities probably increased my ardor in the further pursuit of the game.

I am no pot-hunter nor bonnet-shooter, and I was then younger than I am now, but I have no apology to make for the statement that for two weeks that constantly diminishing bunch of birds gave me daily sport. The range of their flight was for miles, and, like the famous Kidd, "I sailed, and I sailed, and I sailed." Sometimes a long pull against the tide proved that I had been duped by bunches of seafoam or a stake on the meadow; but I always found them again. In fact I secured the last bird of the sixteen four miles from the inlet, after pushing my boat nearly a mile up Sawmill Creek.

This was probably ten years ago, and I do not remember that I have ever seen a live specimen of the egret in Jersey since, unless I was right in believing that a group of them were on the Barnegat meadows one day when I was fishing there. At least they were too far off to be identified, and I never expect to have another fortnight with the "white geese." T. B. A.

NEW JERSEY.

THE CORN CRAKE IN NEW YORK.

ON Nov. 6, 1883, a corn crake (*Crex pratensis*) was brought to me by Mr. William Dommer, who stated that he found it the day before running about rapidly in a cabbage field on Green Island, opposite Troy, N. Y., and shot it as it flew when flushed by his dog. The bird was in nice plumage and good fleshy condition, weighed six and one-fourth ounces, and had in its stomach remains of a very large grasshopper and a seed of great bitter weed (*Ambrosia trifida*). It was an adult female, and I have it mounted in my collection.

I am not aware that the corn crake has ever been brought alive from Europe and set free in this country. Some books on North American birds state that it appears to be a common summer visitor to Greenland, from whence stragglers probably reach the eastern coast of the United States, where it has been found on several occasions. The only specific record known to me of the capture of the bird in this country is that of one shot near Salem, N. J., as noted in "Proceedings of the Academy of Natural Sciences," Philadelphio, 1855, Vol. VII., page 265. Probably some readers of FOREST AND STREAM can give further information of the corn crake in America. AUSTIN. F PARK.

TROY, N. Y.

THE ROUGH-LEGGED HAWK.—The note on the rough-legged hawk in FOREST AND STREAM of Jan. 31, does not allude to the position which this species should occupy in the minds of sportsmen and farmers. I have set up these birds till weary of so doing. I have three in my cabinet, black enough for all practical purposes, and have had them of every shade from that of the redtail hawk to the crow. On the broad meadows of the Connecticut in migrations they outnumber all other hawks together. They are hardly driven south by snow in November and December, and return with the first bare ground in March. My friend Damon, of Northampton, an ardent ornithologist, has shot them from his buggy well up among the hundreds, taking advantage of their clumsy and sluggish habits to drive within easy gunshot "most every time." But that is not all. To the owners of the meadows they are of great benefit. Of all the hawks the most harmless, never to my knowledge taking a chicken or bird, but harvesting mice by the thousands, and saving tons of grass and grain by so doing. I have counted a dozen in sight at once, sitting stupidly on trees in a morning, and not a mouse could eat his breakfast above ground, without at the same time making one. The unparalleled change of color has caused some amusement to mature heads. The Smithsonian, when young and ambitious, made three hawks out of the one, but hastily withdrew two varieties when confronted by Dr. Wood's platoon of specimens. I shall, as I have done for years, plead with sportsmen to spare these birds. They have no feet for holding large game like other hawks, and their being always loaded with fat, shows their success and usefulness as mousers and consequent friends to the agriculturist.—B. HORSFORD.

Male Woodland Caribou.

Female Woodland Caribou.

"ANTELOPE AND DEER OF AMERICA."

NO study is more delightful than that of the habits of our large game, and yet the lack of knowledge about these animals, even among the most intelligent of sportsmen, is remarkable. Although the sources of information at their hands are considerable, there are but few men who are at all well acquainted with the habits of these large species. This is the more deplorable because this large game is so rapidly passing out of existence, that it will soon be only a memory, except to the most ardent of hunters, and because, owing to the rapid settling up of the country, the conditions of the life, and so the habits of these animals are continually changing. It is true that in many sections of the United States the Virginia deer clings to its haunts with surprising tenacity, but it is equally true that most of our other large game animals are becoming extinct with a rapidity that is most saddening to those who for years have taken pleasure in living with them in regions where they were at home, and in observing their habits. How swiftly and surely this extermination is taking place is realized by but few people.

To many men the memories of the days, weeks and months spent in the forests, on the prairies, or among the mountains, in the companionship of God's wild creatures, are the most satisfying and pleasing of their lives, and these recollections come back more vividly in the after years and give rise to more delight than do the thoughts of their triumphs of pen, of oratory, or of statesmanship. And yet there are hundreds of men who, in one way or another, have hunted large game, have spent months in its pursuit in a

Male Columbian Blacktail Deer.

country where it was perhaps abundant, and who know but little about it. They have had guides who were hunters, and they have depended wholly on them. These guides have taken them about over the country, have found the game, have brought them up within shooting distance, and have told them when and where to shoot. The employers—the "gentlemen," as they are called in some regions—simply held the gun and pulled the trigger.

Men who thus depend entirely on others, travel with their eyes shut. They have no idea of finding their way about without a guide. Take them over the first hills behind camp, and turn them around once or twice, and they are lost. They take no note of the habits of game, and even after a long experience in hunting, do not know where to look for it. They cannot tell a deer's track from an antelope's or a sheep's. Their powers of observation have not been trained; they do not see what goes on about them.

Happily all men are not so. There are others who, from a week's hunt, will bring back a note book full of interesting facts and incidents concerning the game which they have been in search of. Within a day or two they will have learned so much of the country that they can hunt through it alone. They observe the salient features of the landscape, and mountains, streams and trees become to them so many plainly marked guide boards, by which their steps are directed through a country hitherto perfectly unknown. With men such as these, it is a pleasure to converse after their return from a hunt, for their conversation fairly bristles with facts. On the other hand, one hears constantly from people of the former class, who have had abundant opportunities for observation, statements which are so wide of the truth, and which betray such groping ignorance of the commonest facts in the natural history of all wild animals, that we are constantly surprised at the want of information concerning them. And yet there is no hunter—no one, we should perhaps say, who imagines himself a hunter—who would not be glad to know all about this game if he knew how and where such knowledge was to be obtained. Although it is very true that about some species of our large game the literature is scanty, fragmentary and widely dispersed, there are others about which a great deal has been written, and the most familiar

Young Woodland Caribou.

group, that which includes our deer, has been quite fully treated by a most competent authority.

When Judge J. D. Caton's valuable work on "The Antelope and Deer of America" first appeared, we called attention to it as the most important work on the subject which had yet appeared, and this pre-eminent position it still occupies. The wide dissemination of this most excellent volume would do much to diminish the prevailing ignorance on this subject. The opportunities which Judge Caton has enjoyed for observing the habits of the antelope and most of the species of North American deer, have been remarkably good, and to this study he has devoted years. His work is not the unconsidered production of an individual seeking fame, but the careful and painstaking work of a conscientious naturalist. And yet it is written with the enthusiasm of a man who is devoted to his subject, and who has omitted no detail, however slight, which might throw light upon the habits of physical characteristics of the animals which he was studying.

On all points which concern the mode of life of our more familiar species of deer, Judge Caton is the highest living authority. For many years he has kept in confinement large numbers of elk and deer of various species, and has thus been able to observe them closely at all seasons of the year, while they were to all intents and purposes in a state of nature. Having them thus constantly before his eyes, being keenly alive to the importance of observing them, and of recording his observations, he has accumulated, and given to the world in a very attractive form, a vast mass of facts of the very highest value.

In all, Judge Caton has had over one hundred elk in confinement in his park at Ottawa, Illinois, and he has had no less than fifty-four living individuals there at one time. Of other temperate zone species he has had the Virginia, Acapulco, mule, and Columbian blacktail deer, and the pronghorn antelope.

Nine species are treated of in his work: The antelope, moose, barren ground and woodland caribou, elk, mule, Columbian, Virginia and Acapulco deer. To each of these separately considerable space is devoted. The synonomy, description, geographical range and habits are treated of in the articles devoted to each species, and after all have been thus discussed, we come to chapters on the *Cervidæ* taken together. The titles of these chapters are Comparisons, Groupings, Habit and Domestication, Hybridity, Aliment, Congeners, Diseases of the Deer, The Chase, The Skins, with an Appendix treating of the glands and the tubes in the feet of the *Cervidæ*. Perhaps there is no better way of illustrating the breadth of the field which the book covers, than by showing, as above, what it contains. Its 425 pages are full of information of just the kind that is desired by the hunter who is something more than a mere killer of meat.

One of the most interesting subjects connected with the group, and one to which the author has given great attention, is the antlers of the deer, a topic about which few men have any intelligent knowledge. To this subject over sixty pages are devoted.

A very interesting point relative to these osseous outgrowths is the curious relation which exists between them and the reproductive organs of the deer. On this point Judge Caton has made many interesting observations, the great number of individuals at his command enabling him to experiment very fully, and he has thoroughly established the fact of an intimate connection between these organs and the antlers.

Judge Caton's work is profusely illustrated, figures of all the species described, and of several exotic forms, being given. Besides these there are a vast number of illustrations of antlers, feet, glands, etc., from each of which something may be learned. One of the most instructive of all the figures is that of the tails of the different species, and it would be well worth the while of the very large number of individuals, who, from the confusion arising from the misleading name of one of the commonest species of our western *Cervidæ*, are in doubt as to what the true blacktail deer is, to study this very interesting woodcut.

There are some points on which we do not altogether agree with Judge Caton. Thus we cannot subscribe to his system of nomenclature, nor do we regard the woodland as a species distinct from the barren ground caribou, nor, as we have elsewhere written, do we believe that the vision

Mule Deer.

of several species of our deer is "defective." But on all that is essential—on all matters of fact—we may unhesitatingly accept Judge Caton's views as sound and wholly free from prejudice.

SQUIRRELS IN CONFINEMENT.—Lockport, N. Y., Jan. 30.—Probably the largest private collection of squirrels in confinement in the State is kept by Mr. Charles Shaler, of this city. I had the pleasure of paying them a visit to day, and was surprised at the number. To the question put to Mr. S., "How many are there of them?" he answered, "I will give you $50 to count them correctly." I did not undertake the task. Mr. S. finally said there were about forty of all kinds—black, red and fox squirrels. I think there were four of the latter. He has nine of the gray at present. Mr. S. said he commenced keeping them about fifteen years ago, and that they breed every year, commencing in February. To the question, "Do they ever breed in the fall?" he said that they had done so in one or two instances. Mr. S. claims that the young do not see until they are forty days old. He keeps them in a room built out on the east side of his house, inclosed with coarse wire netting. Here there is a labyrinth of dead trees and branches for them to run among; also wheels for them to turn. Attached to one of the latter he has a miniature train of cars, which is kept in motion a good share of the time; and I noticed that the festive little red did a good share of the work, although this species is in the minority in number as well as in size. Mr. S. promised to let me know when there were some young squirrels, and to convince me that they do not see until they are forty days old.—J. L. D.

Bird Migration.—In the number of Forest and Stream for Jan. 24 was printed the general circular on migration of the committee of the American Ornithological Union. As superintendent of the "Mississippi Valley District" I wish to supplement it by a special appeal to the sportsmen of that portion of the United States. Exact reports on the migrations of the water birds in the Mississippi Valley are yet to be written. We have plenty of notes on "Ducks and Geese," "Snipe and Plover," but for the accurate study of migration, such notes are, to say the least, unsatisfactory, because the several species are not separated. The observers are not to blame for this; they have done the best they could. Like the most of mankind, they cannot distinguish the different kinds at a distance. What we want, in addition to the general reports on all birds, which we are glad to get from anybody, is special reports from those who from profession or by practice have learned to recognize the various species of water and shore birds, both in the hand and on the wing. The Mississippi Valley contains many who are eminently fitted to aid in this work. There is hardly a lake in that broad territory where some one is not now anxiously awaiting the disappearance of its ice and the appearance of the water fowl; hardly a marsh that some one will not later be watching for the first signs of the birds that are to give him such glorious sport. These are the persons whose help we want. But the professional hunter is the man par excellence whom we are after. He is the one who is at home with the birds, whose business it is to watch and note accurately their comings and goings, and if he will contribute his observations, the spring of 1884 will see for the first time an extended series of exact observations on the migration of our water birds. Let all, then, who are willing to give us the benefit of their notes send in their names and I will furnish a fuller statement of plans and wishes.—W. W. Cooke (Caddo, Ind. Ter.)

Screech Owls in a Chimney.—Lockport, N. Y., Jan. 29.—The inclosed was taken from the Lockport *Journal* of yesterday: "About two weeks ago a stove was put up in a room in the residence of J. H. H. Clark, on Chestnut street, which had not been occupied for some time, and every night a rattling and scratching noise would be heard in the previously unused chimney. Occupants of the room endeavored to get the uneasy visitors out of their quarters, but without success until last night, when the fire became too hot and two full fledged screech owls, who had lodged in the chimney, came tumbling down into the fire place, overcome by heat. It is very seldom that screech owls make their homes in chimneys." The birds were brought to my son to be stuffed and mounted, and were male and female, and I think last season's birds; they were in good shape, but very poor, and I think they could have had but little to eat during the two nights they have occupied the chimney. My son has stuffed a number within the past month, and with this exception they have all been very fat.—J. L. D.

Tame Quail.—Monroe, La.—A lady friend of mine, Miss Slaughter, has a tame quail of our small variety, which domesticated itself. Miss S. lives on the bank of the Quachita, near Monroe, the premises being surrounded by corn and cotton fields. The bird, a female, came voluntarily into the yard and associated itself with the domestic fowls. It has been in the poultry yard about a year, and rarely leaves its domestic companions. It takes an active interest in matters at feeding time, and by its extraordinary pugnacity secures for itself a fair share of the food thrown to the chickens. Miss Lou says it will ruffle up its feathers and boldly attack a hen of ordinary size. A very curious feature about this case is that the bird built a nest in the garden last spring and laid some dozen of eggs, having no contact with any other member of its tribe. Part of the eggs were placed under a setting hen, and I believe the bird itself sat on the others, but none of them were hatched, owing, I suppose to want of impregnation.—Ouachita.

Another Tame Crow.—Referring to Mr. Sprague's tame crow, I am reminded of one formerly owned by a family in a village one and a half miles from my residence. This family ran a hack several times a day to the railroad station, one mile distant. For several weeks this young crow attempted to accompany the hack to the station but was invariably attacked at the outskirts of the village by some kingbirds who quickly drove him back to the house in which he at once took refuge. This crow became such an inveterate thief that the family gave him away to a young lawyer in the neighborhood. He kept him confined in his office till he became attached to his new home, when he allowed him to fly about the neighborhood. Although this young lawyer was fairly itching for business he soon had more "petty larceny" cases than he could attend to and was compelled to dispose of his crow, which soon went where all bad crows go.—M. P. P.

Early Migration of Woodcock.—On Thursday morning, Feb. 7, while out with my beagles, I flushed a woodcock. The bird was evidently a fresh arrival, as he seemed tired and loath to rise, being sprung several times, and always taking short flights. The weather had been mild for several days, and the morning in question was murky with drizzling rain. He was found in a low piece of woodland on the very verge of West Philadelphia, a spot that thirty years ago was a favorite haunt of these birds, but the steady growth of the city westward has trenched on this territory until now the houses are built up in solid blocks to within one hundred yards of where this bird was found. In a long experience I never remember to have seen woodcock so early in the season, and the case is especially remarkable, as up to within a week the weather has been very cold and the ground covered with snow and sleet.—Rusticus (Philadelphia, Pa.).

Recent Arrivals at the Philadelphia Zoological Garden.—One grizzly bear (*Ursus horribilis*), two raccoons (*Procyon lotor*), two gray squirrels (*Sciurus carolinensis*), one opossum (*Didelphys virginiana*), one great horned owl (*Bubo virginianus*), one herring gull (*Larus argentatus*), one broad-winged hawk (*Buteo pennsylvanicum*), two yellow-shafted woodpeckers (*Colaptes auratus*), one Amherst's pheasant (*Thaumalea amherstiæ*), two muscovy ducks, one diamond rattlesnake (*Crotalus adamanteus*), five alligators (*Alligator mississippiensis.*)

N. B.—In our notice of pictures received from Mr. G. Hill, Hudson, N. Y. (page 33), that gentleman's name was inadvertently printed Mills. Find in answer to "N. D." (same issue), dam of Snop should read Hill's Tilley.

Game Bag and Gun.

THE CHOICE OF HUNTING RIFLES.

[*Continued from page 30.*]

Editor Forest and Stream:

The man who asserts that he can remedy the defect of too much curve in the trajectory, either by high sighting, by taking "coarse lead" on the front sight, by holding over or high upon the game, or by elevating sights, or by any other plan, simply asserts that he is a quick and accurate judge of distance under the ever-changing conditions of ground and light; and that, too, in the very face of game that is generally ready to leave on the instant, and is often in motion. Every method of remedying this defect in the field involves the calculation of distance. There is positively no escape from it. With any man who makes such an assertion I have nothing to argue. Our experience is antipodal; there is no common ground upon which we can meet; no premises that we can use as a common starting point.

The man who asserts that a .40-caliber solid ball is large enough for deer, antelope, etc., simply asserts one of these three propositions:

First—That he can hit his game just where he chooses; or,

Second—That a ball is just as effective in one part of an animal as in any other part; or,

Third—That the crippling and torturing of game is a matter of no consequence.

I challenge the world to point out any way of escape from impalement upon the point of one or the other of these propositions.

With such a man also I have nothing to argue. There is no common ground between us. He is a being from a loftier sphere from that in which I live and for which I write. For years I have known that genius of the field who is never troubled with the eccentricities of lead. I have seen him perform. For a mere "duffer," a blockhead who has not sense enough to place every ball in the heart of a bounding deer to offer advice to such a demigod, requires more courage than this "duffer" happens to possess just at present.

There are, however, many clods of common clay who, like myself, feel compelled to bow to the vagaries of lead. Especially so when it is traveling upon a high curve, and the game is traveling upon a still higher curve. And we are weak enough to prefer a bullet that may take effect when accidently planted at .87.906 of an inch from the precise point where our aforesaid friend would plant it. And so weak are we in this respect, that we are hopelessly blind to the loss of an extra square inch of "pelt," and can even endure with composure the loss of fifteen and a half ounces of meat irretrievably "mussed" and ruined by an expansive bullet.

Such persons now prefer a bullet made expansive, and some prefer it even larger than .40. By some it is objected that expansive bullets are not sufficiently killing for want of penetration.

The effect of expansive balls has been immensely overrated. A large amount of twaddle has been written about "express shock," etc, tigers wilting like wet rags under a single bullet, and grizzlies' heads pulverized like puff balls, etc., etc. One who has never tried one of these balls but had only read of them, could conceive nothing less than a bottled up thunderbolt suddenly let loose in an animal's body. There is nothing to be done but to make the contact. The instantaneous paralyzation of every nerve and muscle in the victim results as a matter of course. Stop now, my friend, you need not give me a record of so many tigers or bears killed with a single shot each. I can find you a single muzzleloader of .45-caliber in this county that has killed fifteen grizzlies in just fifteen shots, all solid balls. I know, too, how it was done. By following the bear hunter's rule, viz., "let a bear alone unless you can get a dead sure shot." Any good hunter with any kind of a rifle that is accurate, will make runs of six, or seven, or eight deer killed in succession with the single ball, and all falling within sight. And it is probable that more deer have been killed at a single shot from small-bored muzzleloaders with round ball than have ever been killed or ever will be killed with all other rifles put together.

All such things prove exactly nothing except that the animal happened to be hit in the right place. Give me the formula for reaching the right spot and I want nothing better than a .38 or .40 solid ball. On what are known as the vital points of deer and antelope the difference between the most destructive express balls and the small solid ball amounts to little. For dangerous game it may be different, and even very little of course amounts to something. But I believe that even there the effect is immensely exaggerated. I have often seen deer, struck at the point of the shoulder, run fifty or sixty yards with 400 grains of leaden "splash" driven almost to the skin on the opposite side and tearing lungs and heart completely into shreds. The majority so struck will run some distance precisely as when struck with a solid ball; and the latter will bring many down in their tracks as quickly as the expansive one will. Nor can I discover any material advantage (in this respect) from increase of powder. And the principles of so much "force expended in an animal's body," "express shock," etc., I can find little or nothing in—so far as the vital spots are concerned. And I doubt if any one living shoots as large a powder proportion as I do, or has cut the hole of expansion bullets into more varied sizes.

But when we come to shots not on the vitals, the difference between the solid and the expansive ball becomes immense. And the place where common mortality is liable to plant a bullet in an animal running, or one a little too far off, or in bad light, or in brush, etc., etc., and which are not immediately vital, comprise almost two-thirds of the body.

While few or none will dispute this last statement, there are still many who claim that the solid ball, defective as it is, is still better than the expansive one, because of its better penetration.

There is some truth in this. Seven years ago I said in these columns that in the long run penetration was about as essential as expansion. Ever since then I have been using expansive balls of various sizes and shapes, and am fully satisfied that for 100 shots taken as they generally run a solid ball is better than an expansive ball that opens too quickly or that goes into splash upon flesh. I said then that the expansive hole in the bullet should be small and tapering to a point at the bottom. The more I use them the smaller I make the hole, and the more I am convinced of the necessity of making it small.

If the ball opens too quickly no amount of powder will give it sufficient penetration for those shots in which penetration is needed. It simply makes a wider flesh wound but without sufficient increase of depth to be of practical use. For such shots as a little too far back of the shoulder, or in the brisket, it will still be far better than the solid ball, but it will be inferior for nearly all the raking or quartering shots, where a ham must be shot through before the ball can enter the body. The expansive ball must in any event have a very heavy powder charge behind it, as even slight expansion checks it immensely, and no amount of powder will suffice for good penetration unless the ball is made to open slowly.

I think all the objections to the efficiency of expansive balls are caused either—

First—By too much expansion; or,

Second—By too little powder.

Both of these are combined in the Winchester express. The ball goes to pieces on flesh alone without touching bone; and though far superior for shots on the stomach, too high or too low in the shoulder, etc., of a deer, it is not equal in efficiency on some raking shots from behind to the .45-60 of the same company. The copper tube adds little or no strength to the ball; it is needless for accuracy or any other purpose whatever, except to catch gulls who think it has some marvelous virtue. If the hole were made narrower, shallower and tapering to the bottom, it would be far more effective, in the long run, though for some shots it would be less quickly fatal than as at present made. It also needs more powder, fully fifteen grains being needed to balance the increase caliber over the .44, the larger tube requiring always a little more powder for the same weight of lead. The ball is heavy enough, and if made to simply expand to about four-fifths of an inch, and backed by 120 or 130 grains of the very best powder, the gun ought to be the most effective of all rifles that can be held to the shoulder, its repeating power overbalancing all else.

The expansion of a ball can be tested only upon flesh. Soft clay may possibly do, but tests made upon wood, etc., are worthless. I have seen bullets with copper tubes hold together on wood and make good penetration, while the same bullet would invariably go to flinders upon flesh. If the makers of repeaters or rather express rifles will listen a moment I can give them some good advice that will tend to reconcile and unite all the conflicting opinions upon this point.

First—Make the ball light enough and the rifle heavy enough to prevent much recoil, so that a difference of twenty-five grains in the weight of the ball will not require any change of sights at ordinary range.

Second—In every box of cartridges let one-half the balls be solid ones, so that those who do not like expansive balls or want some solid ones can be accommodated.

Third—Make in the point of the rest a hole only half the length of the ball, tapering to the bottom and not over one-tenth of an inch wide at the top, and leave it open.

Fourth—Upon the box cover inform the purchaser that the latter balls can in a moment be made expansive to any extent desired with a gimlet, reamer or point of a penknife. Also that if he thinks the hole will affect the ball's accuracy that he may close it with wax or tallow, but that there is no need of anything.

Fifth—The last and best. Throw the copper tube to the dogs, stiffen the ball with tin and put behind it the last grain of powder that the repeater action will bear.

Quite an effective rifle may be made of a .40-caliber, with 100 grains of powder and 200 of lead. And I see no reason why such a rifle could not be made to take a cartridge of 120 of powder and 250 of lead. If the latter could not be worked through the magazine, it might be inserted in the barrel by hand when the carrier block is down and there is no haste in loading.

I think, however, if any one can only overcome the unmanly fears of a little recoil—entirely unfounded—and endure the sacrifice of a few ounces of meat, he will find no trouble with the .50-caliber of the Winchester, remedied as above suggested. For all-around work, for penetration, expansion and retention of velocity, a ball must have actual weight. Without weight, momentum or force is impossible, and without solid walls around the hole in a bullet slow expansion is impossible. Make the hole too small in a narrow ball and it does not expand enough. Make it large enough and it may go to pieces too quickly. Put weight enough in a .40-caliber ball to force its expanding front very far through flesh and you must make it too long to have good initial velocity.

How, then, shall we strike a compromise between the three conflicting elements of high velocity, weight, and sufficient striking surface? There is but one possible way to give a ball weight without cutting down its velocity. And that is by widening it. Of course it will need more powder, but give it that and you may get as high a velocity from the larger caliber as from anything. The late rifle trials in England show 1,946 feet a second velocity for a .50-caliber; powder 138, lead 342; while the .40, with the same proportion, 82-209, gave 1,873, and the .45, with 110-322, gave 1,776 feet. From the smaller caliber you may get the higher velocity from the same amount of powder, the tube being smaller. But it is only in the larger bore that you can unite comparative lightness of the bullet with sufficient actual weight for good penetration and crushing power.

California.

Editor Forest and Stream:

So long as there are different patterned rifles and men of different patterned ideas to handle them, and each handling attended by different circumstances, into which the merits of the handler enter as largely as the merits of the weapon handled, so long will different ideas be entertained relative to the efficiency of the various makes, each advocate invariably standing by the bridge that carried him safely over.

In the discussion now carried on in the Forest and Stream on the "choice in hunting rifles," I join in favor of Sharps army carbine, for frontier use, against all comers. I, for reasons strong as life, believe them unexcelled and far superior to any magazine rifle that has yet come into notice. For close and rapid shooting the magazine rifle may be without a peer, but such a happening comes but once in a hundred times, and when it does come the man that handles it must be its master, or nine shots out of ten go wide of the mark. Few men there are that can hold such a rifle to their shoulders and manipulate it effectually on objects distant fifty to one hundred yards.

Looking back over a long and varied experience in the use of rifles against both man and beast, I have yet to see it done. At long or short range, the carbine referred to is a

hard and deadly hitter. Its simple mechanism is always in order and they are as readily loaded as any rifle not a magazine-made, nor will I except the magazine variety if the user must needs take it from his shoulder to cast and replace the empty shell, for in that case a practiced hand will, with a Sharps fully hold his own. The latter, moreover, is exceedingly short and light, a matter of no small consideration, where constant use is required. The short, light barrel will, I know, be pooh-poohed by target ring hunters, but to the man that can hold them down they are kings.

Some time during the early part of the seventies I, with several others, was prospecting for placer ground on the headwaters of the Santa Domingo River, in Sonora. At that time the Apache Indians left the San Carlos Reservation, in Arizona, and raided as far south as Ures. The main body of them passed us on the west, as we afterward learned, but a party of probably a dozen happened our way, and the trouble began by the Indians ambushing myself and a companion as we were riding through one of the most beautiful oak parks it has ever been my good fortune to see. At the first fire they put us both on foot, but fortunately without bodily injury to outselves. My animal, a full-blooded bronco mare, was also uninjured, but the surprise was so sudden to both that she had me off in a jiffy. Although somewhat dazed, we up and treed instanter, and then the fun commenced. My mare, for a minute or so, galloped wildly about her struggling companion, and then made a bee line back the way we had come. The Indians in the meantime yelling their best, but not till we broke cover did they dare attempt to close in, and only then by individual spurts from tree to tree, as we made like moves, each one covering the other's retreat in turn. Finally, by a hard run we reached a deep arroya that cut across the bottom at right angles and made us masters of the situation, and gave us comparatively smooth sailing into camp, which we found thoroughly alarmed by the mare which had preceded us, and prepared for the worst.

We were at this time five strong—three Americans and two Mexicans (an old man and a boy). Our arms consisted of one Winchester rifle, two Sharps carbines and two old army muskets, with the barrels sawed short. The old man gave good counsel, and under his directions we hastily prepared for the attack that we knew was sure to come. Although the site of our camp was well chosen and watch constantly kept, those off guard slept but little that night.

Shortly after sun-up next morning, when we were congratulating ourselves on our security, a rifle cracked as a bullet pinged across our camp and broke ground a short distance beyond. To our surprise it came from a direction unexpected, but hugging the ground closely we rolled our blankets into temporary breastworks, and with ready rifles waited the issue, which we purposed should not be one-sided. Not knowing from which way the next shot would come we faced in the most probable direction. Presently a second shot, followed closely by a third from the same direction as the first, told us that our foe was reaching for us from one side only. We therefore gave it our united attention. A wreath of smoke hanging to the top of the grass localized our man. The only Winchester in camp was fired at him repeatedly without effect, other than to bring back answering bullets, one of which took the side out of a canteen that was standing by a stone previously used as a seat.

With us bullets were bullets, as none could be bought nearer than Tucson, distant nearly three hundred miles, and as each cartridge fired by the Winchester was one more wasted, it was decided to try him with a Sharps, and the duty assigned to the writer of this, who, hastily rising to a half kneeling position, fired two shots in rapid succession. A convulsive jump told us that something had gone wrong in the Apache camp. Fearing a ruse, we awaited further developments, but as none came, we investigated, and found the gentleman doubled up with a bullet hole through him from his left shoulder inside of right hip.

He had gained his vantage point by climbing up the side of an almost perpendicular box canyon, and then crawled fully three hundred yards on his belly before firing a shot. He was armed with a needle gun, old army pattern. They undoubtedly shoot as hard and carry as far as a Sharps, but because of their weight and length, are too cumbersome for a prospector to carry. We had, previous to this little incident, an exalted opinion of the magazine rifle, but after that we stood by the Sharps, and subsequent events justified our faith. I could give many illustrations in point, and may, perhaps, later on, if this is found worthy of publication. Now, however, I give but one which came under my notice when prospecting in the San Simon range with W. E. Cook of, I believe, Rochester, New York.

We were following up a dry path leading our horses, when we struck a bear trail that crossed the path we were in, to the opposite bank. As near as we could determine it had been made by not less than five animals. We mounted and followed the trail till it broke up, and was lost on the hard mesa, but off in the distance we noticed what appeared to be a cow and calf. Surprised that they should have strayed so far from any settlement, we rode carelessly toward them with a view of examining the brand if any they had. Greater, however, was our astonishment, when up with a snort raised an enormous she grizzly and a good sized cub. We had with us a crop-eared Mexican cur dog that stood probably about eighteen inches high at the shoulders. We had always regarded him as a good watch dog and a keen fighter, but at the sight of the bear he developed qualities that made him dear to us afterward, for with a vicious bound he sprang at bruin's throat, but being instantly knocked down we thought him killed. The next moment, however, he had her by the hams, and so quick was he that she could neither bite nor strike him. Several times she essayed a dash at us, who, on foot, were vainly endeavoring to lead our terrified horses closer up, but each time she gave us her attentions the dog gave her his.

As our horses refused to approach, it was decided that I hold them while Cook advanced with his Winchester to shoot her. He at a distance of not more than twenty steps fired at her four or five times. As each bullet struck her she would lie down, roll over and cry, then jump up and rush toward him, but as she did so the dog invariably bit her on the hams, and that annoyed her worse than the Winchester. In Cook's haste to cast an empty shell it fouled in the extractor, and he could neither get his lever up nor down. Throwing down his gun he ran to get my Sharps; but as I had too long stood a quiet spectator to one of the most exciting scenes I had ever witnessed, I left the horses with him, ran up, shot her through the brains, and the battle was over. She was thin in flesh, but her hide was equal in size to that of a large ox. The cub was very fat, and when dressed weighed about thirty or forty pounds. Before killing it we fought it with the dog, but as the latter was jaded in his fight with the old one, the cub on a square tussle was more than his match; but every time it got loose from the dog it would climb on the dead body of its mother and cry piteously.

The fouling of the shell, as stated, created with me a distrust in all magazine rifles of like make. Although I must confess that I afterward sent to San Francisco for one, and, through the excellent judgment of a friend, secured a very good one, but the caliber being too small for my use, I traded it off and fell back on my true but time-worn carbine. Later on it was stolen from me by a Mexican, and as he hied himself to the land of tortillas and beans, I never saw it afterward. A friend, knowing my admiration for the gun, presented me with a new one of the same make. It shoots as wicked as its predecessor.

In conclusion, I can safely assert that, if properly handled, there is no animal in the Southwest that can stand against them. I once shot a cinnamon bear that was walking on the side of a hill above and from me. The bullet struck and shattered the left ham bone, passed through the ham and ran under the skin along the entire length of the animal and effected a lodgment at the base of the upper jaw. Again, I shot at a bear that stood quartering to me. I saw the bullet strike the ground beyond him, and as he turned and headed down the canyon I believed that I had overshot him. Suddenly he stopped as if considering what was best to do, then staggered forward and fell dead. The bullet had gone entirely through him. In one winter alone, in the Santa Ritas, I killed fifty-four deer, and with but one exception, I never found a bullet in any of their carcasses.

ADIOS.

TUCSON, A. T., Jan. 28.

THE BIRDS IN WEST VIRGINIA.

SITTING by a large open fire, with my two dogs on the floor near me, for I have not as yet a better half, and having just finished overlooking gun and fishing tackle, I have picked up several of your last issues, and the first thing I see is your call to "feed the birds." Thinking you would like to hear from this part of the country, I send you this.

We had better partridge shooting in this county last fall than we have had for years, though the best that was done was thirty-eight to two guns. Our birds are wild, very strong, and feed close to woods and thickets, into which they go when first gotten up. We think thirty-eight good, very good, the rough country and all things considered. The gentleman shooting with me, Mr. S. W. M. P., of Philadelphia, is a much better shot than I am, and should this meet the eye of any of his Philadelphia Gun Club friends they will know what he killed and what fell to my share. Take him all in all, I think him the best all-around field shot I know.

I am taking care of and feeding at my own place about fifty birds, and have induced some six or eight of my farmer friends to feed any birds that may come about their barns and outbuildings. I furnish the feed; they do the feeding, and I have just returned from a "round trip." I find they have upward of 200 partridges feeding, and hope to get them safely over this hard, cold winter. I hear of others taking care of a covey or so, and knowing the country here as I do, I feel assured many birds will take care of themselves. The farmers last fall left much corn outstanding, and it has proved of great advantage to our game.

In the proper season, when our black bass fishing begins, I shall be glad to give any information I can to any of your many readers who may wish it. I use the fly entirely and know the Potomac and Cacapon rivers for miles as thoroughly as I do the road over which I drive to get to them.

N. S. D. P.

BERKELEY SPRINGS, W. Va., Feb. 1, 1884.

ANOTHER CAT TALE.

"REIGNOLDS'S" cat reminds me of a tough specimen that I had some experience with some thirty-five or more years ago. I was boarding at a large farmhouse, where they kept a fine flock of poultry. Late in the spring the egg-gathering members of the family found fresh-laid shells emptied of their contents. The mischief was charged upon skunks, but one day a large semi-wild, yellow and white cat of the Thomas persuasion was caught in the act. This cat had recently taken up his abode at the large barns upon the place and was remarked a fine specimen, but this egg-sucking development caused an immediate proclamation of outlawry from the household department. At that time I kept an excellent hunting rifle and practiced with it almost daily.

One afternoon a little girl of the household who had been out gathering eggs, came running in flushed with excitement, holding a broken egg, saying she had just driven the old yellow cat from the nest and he was then out back of the further barn. Hastily loading my rifle, I ran across the road where I could look down back of the long line of barns. Just as I reached the corner of the nearest barn, I met the cat, which instantly beat a rapid retreat and the intervening fence prevented a snap shot on the run. The cat passed the barns and turned under the long shed beyond, stepping behind a large, flat stone, upon which one of the shed posts rested, and looked back. I could just see his left eye by the edge of the post and over the stone. The distance was about thirty-five yards, and in those days I rarely missed the size of a dime at that distance when firing at a rest, as I deliberately did in this instance, of course drawing a fine bead upon the cat's eye. The first thought was to set the rifle in the barn and get a shovel to bury the cat, but these animals perform ground and lofty tumbling when shot through the head with a bullet, and as I could see no demonstrations of the kind, I omitted the shovel. Repairing to the shed-post, I found no cat, but did find a surprising quantity of yellow hair and some clots of gore, showing that the bullet done some execution. Nothing more was heard from the cat and no more empty egg shells were found. The family were certain they smelled the dead cat under the barn.

About the middle of the following January we had a fall of some twelve or fifteen inches of snow in one night, which had not yet drifted. The next morning was all that could be desired for fox hunting, the locality being in the Green Mountains. I had an excellent old foxhound, and started early for a large pasture about a mile away, between two large swamps, a famous crossway for foxes. As I was getting well between the swamps the sagacious old hound was ranging well ahead, when he suddenly turned from his course and the wag of his tail showed that he was on a track which, of course, must be fresh. It lead in the direction of the nearest swamp, and a few yards further on the hound disappeared down in a gulley and commenced his peculiar standing bark, showing that he had game at bay. I knew there was no hiding place in the vicinity, and as the hound never hesitated clinching any game found in that region, I was puzzled and hastened forward. Coming suddenly upon the hound not fifteen feet distant, I found him confronted by an enormous yellow and white cat. I had never known him to take the least notice of a cat before, and the peculiar alternation of glances first to me and then to the cat, was clearly an inquiry for orders. I gave the word, "Take him," and in about three seconds the air for some feet around was filled with a mixture of snow and hair, and the hound was uttering muffled yells of pain, which, however, soon ceased, to be supplanted by a long-drawn "yaul" from the cat, who a few seconds later lay limp and dead on the hair-carpeted snow. As he lay with his left side up, I discovered that his left eye was gone. An examination disclosed an unhealed wound nearly in the center of the back of the head. It was the old egg-sucker that I had omitted to bury eight months before. Moral: Always plant cats as soon as you shoot them.

Right here I wish to add that this particular style of cats destroy more small game and insectivorous birds than all the gunners in the land, including pot-hunters. M. P. P.

MUCILAGE-EDGE WADS.

Editor Forest and Stream:

It is to your columns that sportsmen must look for information concerning anything new which pertains to sporting matters, and for that reason I beg a short space to herald a new and, I think, important device for loading shells. All the present methods of securing wads over the shot are unsatisfactory. Crimping is not only a great nuisance, but fails to meet the desired end. On a recent shooting trip I was shown something new in this line, the invention of Mr. M. S. Alexander, of Moorefield, W. Va. The powder and shot are put in the shell in the ordinary way. After the shot are put in, a loader, into which a narrow circle of sponge projects from the outside, is set over the shell. A wad having small strips of muslin, covered with mucilage, is now dropped into the loader and pushed home in the usual way. As it passes through the sponge the mucilage is moistened, and the wad held securely in place by the strips sticking fast to the sides of the shell. Crimping is entirely done away with, and the shells remain almost perfect after being fired. Shells can be loaded more rapidly than by the ordinary method. These wads work splendidly in brass shells, and are far ahead of the patent mucilage-edge wads. I have carried shells loaded in this way for days without the wads starting. This new device, if ever brought on the market, will prove a boon to upland sportsmen. SYCAMORE.

BALTIMORE.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I see many things from the fertile imaginations of sportsmen on practical matters that are not governed by human agency. Marvelously long shots, clean kills at unreasonable distances, and wonderful scores, in one instance forty-eight out of fifty grouse (perhaps it was only thirty-eight out of forty). Now, the natural and uncontrollable inclination of shot is to scatter. This deflection commences the moment the charge leaves the gun. At a certain distance the spaces between pellets are larger than the object aimed at. This marks the killing range of any gun. Forty yards is taken as a standard limit, and most guns are targeted at this distance. Where one gun shows a killing circle at this range, twenty will fail to make a pattern that would be sure to stop the bird if held "straight on." Sometimes a very long hit is made, as occasionally the foolish bird, instead of keeping straight for the woods, tries some fancy flying and comes to grief. Often I have made what I thought a splendid long shot, fifty yards at least.

"I say, Bill, where did you stand?"

"Right there by that patch of briers."

"Where did the bird fall?"

"O, way down the fence, fifty or sixty yards."

"I don't see it nor any feathers near here."

"Well, he fell right about where you stand. Look a little further down."

"Can't find him.

"Well, come this way a little. I know I killed him dead."

"How are you 'fifty yards!' Here's the bird, not over twenty-five."

"Well, I killed him anyhow, and he looked as if he were a hundred yards."

This little scene is quite familiar to us all. I am in favor of some margin. But when we get out of bounds, it don't count. "Dead out of bounds," you see.

MARION, Ind. THIRTY-EIGHT LONG.

A NEW STYLE OF "TURKEY SHOOT."—Marcellus, N. Y., Jan. 30.—*Editor Forest and Stream:* In your last issue you refer to the decadence of the old-fashioned "turkey shoot." We have had several matches in this vicinity this winter, conducted on principles in harmony with those of the S. F. P. C. A. Ten or twelve shooters paid for a turkey and decided who should have it by shooting at a small paper target, the shooter winning who drove a pellet nearest the center. While there was much chance in the game, yet a good shooting gun would win in the majority of cases. The distance was 35 yards, 1¼ ounce, No. 8; target, 5½x6 inches. One gun was fired five times, with an average of fifteen pellets in the paper. Three other guns fired four shots in all and made an average of seventeen. At another match, same conditions, distance 35 yards, target 5½x6 inches, four guns were fired twenty-four times with an average of 30⅝ pellets in the target. One gun an equal number of times, averaged 26½. All conditions were as favorable as could be made; rest, cleaning between shots.—MARCELLUS.

SOUTHWEST FLORIDA.—Myakka River, Fla., Jan. 25.—Thinking that some of the readers of your valuable journal would like to know of some locality on the southwest coast of Florida where good hunting could be found, I can safely say this is the best game country I have seen along this coast as yet. The country I speak of is along the banks of this river, which extends from Charlotte Harbor into the mainland about thirty or forty miles. Along this river deer are very abundant, also turkeys and wild hogs. Although I have seen but one covey of quail, I think they are more plentiful up the river. Wildcats and panthers are quite common around here, and if one has dogs a bear can be found in a short time. One party of eight men, that went up the river a short time ago, killed in a day and a half eight deer and seven turkeys, using dogs. This river could be reached by taking passage on a schooner at Cedar Keys that runs to Hickory Bluff. At the last-named place a sail-

boat could be purchased at the store there, also provisions, etc. The river is only ten miles from the Bluff, and with fair wind a person could run up the river for ten or fifteen miles, or, if desired, a man could be engaged at the store for pilot.—Chester.

Indiana Quail.—Fairland, Ind., Jan. 18.—Reports so far, notwithstanding the heavy fall of snow, are favorable for quail and "ground game" in this part of the State. An unusual number of large bevies are reported left over, and are now in good condition.—C. H. W.

Paper Shells.—The problem of making a paper shell which should possess in many respects the staple qualities of a metal shell, has engaged much of the attention of the cartridge companies, and the claim has frequently been made that success was achieved; but experience developed objections to the new patents. The U. S. Cartridge Company has put out a shell which, it is claimed, is superior to anything of former make. The paper is subjected to a process that renders it water-proof, reliable, and capable of withstanding large charges of powder and repeated reloading. Its smooth, stiff shape—inside and out—is retained after recrimping and firing, and it is not easily bent out of shape by rough usage. They are primed with the new No. 2 Lowell primer, and with a good lock are not liable to miss.

Camp Fire Flickerings.

"That reminds me."

The writer of story No. 36 will please send name and address to this office.

102.

THE "Spoon Hill" gang were sleepily lolling about the waning camp-fire. Talk had run low for some time when all of a sudden some one asked, "Dad, did you ever shoot a deer by the light of a jack lamp?" ("Dad" is the dyspeptic, asthmatic member, and when the fit is on is as gloomy and cross as two sticks.) "Never but once; and I have always regretted it." "Why so?" yelled several at once. "Because it was the means of prolonging this miserable existence." "Out with it, old man, tell us all about it," screamed the entire crowd, as yawns gave way to glaring eyes and anxious faces.

"It happened several years ago. A small party were camped on the bank of Crooked Lake, away up in Clare county, more for fishing and idleness than anything else. This was previous to the building of the F. & P. M. road and deer were quite plenty at that time. The question whether a deer could be captured by jacking or not had been hotly discussed, so it was decided to try the experiment, and I was successful in shooting the finest buck that ever fell to my gun. It was something irregular in regard to season; but the meat was very acceptable in camp, as we were getting tired of fish and salt pork."

"Oh yes, that may all be, but how in the name of all the saints did the shooting of that deer, 'prolong that miserable existence' you just mentioned?"

"Steady now, youngster; don't pull in your fish until you have him hooked. The day before, I had accidentally discovered a small stream in one of my rambles, which I was anxious to fish alone and unbeknown to any one in camp. The day after shooting the deer, while the rest were enjoying their after dinner nap, I sneaked up alone, and whipped the stream with tolerable success, when a gathering of the clouds warned me to either go quickly to camp or to take a thorough wetting. You all know that water agrees with me inwardly, but when applied outwardly it is a promoter of colds, asthma and rheumatism; therefore, I reluctantly started for camp, but the shower was too quick for me, and the pattering rain drops plainly indicated that unless I soon found shelter, a downright drenching was in store for me. On looking about I found a fallen tree, the butt of which was hollow; into this I crawled as quickly as possible. The rain came down in torrents, the lightning flashed, the thunder rattled, the wind howled and tore around fearfully, but there I lay dry and comfortable, as snug as a bug in a rug. Blow, blow, ye winds; rain rivers, cataracts, aye, whole lakes if it pleases you; what care I in this dry, cozy shelter? I kicked up my heels, whistled with the wind, laughed at the rain and bellowed with the thunder. I even began to sing—

"'When the humid shadows hover
Over all the starry spheres,
And the melancholy darkness
Gently weeps in rainy tears.'

when there came a furious blast of wind tearing through the forest, uprooting and dashing to the ground nearly every tree in its pathway. One fell directly across the end of my cosy retreat, smashing and closing up my entrance in the most effectual manner. Vainly I kicked against this summary proceeding. Yelling was useless, as I soon concluded. I saw that the only way out was to cut for it, and at it I went. I had a good knife; the upper part of the log was badly damaged; and I soon had daylight shining through. 'Bah!' said I, 'sicker children have been cured;' and I worked away with a will; and presently had a hole large enough to thrust my arm through, and I was glad to straighten it out, as working in such narrow and restricted quarters had benumbed and almost paralized it. In drawing back my arm my hand was badly scratched on the ragged edge of the log, my fingers loosened their hold on the knife; it fell and slid down on the outside!

"No, it could not be reached. I tried until nearly exhausted. My clothing was as wet from perspiration as though I had stayed out in the shower. A storm of kicking, twisting and screaming followed. All vain and useless. Then a calm; and I arrived at the conclusion that my earthly troubles were nearly over, and that my relatives would be denied the privilege of paying the undertaker for an extravagant and useless show. I began to look away back to my earliest recollection and thought over my entire past life; and as each sin of omission and commission passed before my eyes I humbly begged for mercy and asked forgiveness from that Supreme Being into whose august presence I soon expected to be ushered. Tranquilly, thoughtfully and hopefully I traveled over my entire existence down to the hour I shot that deer, when presto! change. I collapsed, dwindled and shrunk into such utter littleness as without any difficulty to crawl through the small hole I had made in the log; and securing my knife I made my way to camp, arriving in time to gorge myself at the evening meal with the broiled flesh of the deer, which had been the means of prolonging this miserable existence." Grand Rapids, Mich.

Sea and River Fishing.

TROUTING ON THE BIGOSH.

SCALY SUBJECTS.

IN the morning Jack brought the fish, over which the Colonel and the Doctor had disputed as to their identity, into camp with the remark, "Here they are; father says they are all suckers, while the Doctor claims that only one is a sucker and the other two are some kind of perch."

"There is more than one kind of sucker," said the Colonel, "and when I called them suckers I did not mean that they were all of one kind; any one can see that they are different. This one I call a black sucker, while the others are silver suckers. There is another kind, I believe, isn't there?"

"Forty, at least," I answered, "not counting many closely related forms as the buffalo fish of Western waters, and others. This fish, which the Colonel calls the 'black sucker,' is the only one of the three which belongs to the family of suckers; and it is a common species. I will tell you something of it after we get through with the fish which the Doctor thinks are 'some kind of perch.'"

"Give us some double-jointed, nickle-plated, waterproof, cable-laid and hard-twisted Greek and Latin names," suggested Jack, "it makes the fish taste better when it is cooked, to know that it has two names with seven syllables in each, and, as the showman says of the zebra's stripes, 'nary two alike.'"

"Jack's theory that scientific names are used merely to amuse or confound those who may not be familiar with them," I replied, "is not confined to him alone, but is one that I have often heard in different ways before. As a rule, Jack, the names are not hard when you know them, and many fishes have no other names. For instance, take the name 'pickerel;' out of a family of fishes which has five sharply defined and plainly marked species in America, one of the five is called by anglers 'mascalonge,' and the other four are all called pickerel in some parts, and pike in others. As two of these four grow to a size to be angled for, it is a matter of wonder that our anglers, who are observant and more inclined to make distinctions where no structural differences exist than to overlook them, should confound the large lake pike, *Esox lucius*, with the smaller species, *E. reticulatus*. The fishes not only differ in structure, but in color as well, and the angler takes more note of color and attaches more importance to it than the naturalist does. The first of these fishes is marked by oval white spots on a dark ground, and the latter by a black network more or less plain on a ground varying from green to greenish-yellow. There is actually no other way to make it plain which fish is meant than by using the scientific name. There are a few anglers who, while knowing the scientific names of the fishes they take, hesitate to use them for fear of being thought pedantic. They never hesitate to speak of a rhinoceros or a hippopotamus, both of which are the Greek names of animals as used in zoölogy, nor in speaking of plants do they fear to mention the heliotrope, chrysanthemum, coleus, ailanthus, verbena and other systematic names, for the reason that they are more commonly used, and because the names were introduced with the things to which they belonged, and they have become familiar."

"Jack," said the Doctor, "while I know nothing of ichthyology, I recognize the fact that the language of all sciences must be in what are called the dead languages, because they never change, and are therefore employed as a common nomenclature for all scientific purposes by all civilized nations, or rather by all those which have derived portions of their languages from these older ones, for I deny that the Japanese and Chinese are not to be classed as 'civilized.' In anatomy and medicine we have the dead languages as a common medium in both structure, diseases and remedies. Jack only needs to be reminded that when he speaks of an asphalt road, cellar, or other surface, he is using one of those horrid latin words which, when he goes to college, as his father intends he shall in a couple of years, he will learn is the *pons asinorum* of the angler."

"I'll tell you how Jack is," said his father, "he thinks that what he understands everybody else should know. A few days before we left home he was trying to explain to a maiden aunt of his, who never went further in mathematics than the multiplication table, how, by triangulation, the distance to the sun was made out. He stated it at ninety-two million miles, but as he knew that the astronomers differed to the extent of two millions of miles more, he did not care to go into astronomical science further, and yet this is one of the most exact of sciences. Certainly, ichthyology cannot claim to be an exact science, for it is well known that it is not as far advanced toward a solid foundation as some other departments in zoölogy."

"No," answered I, for the Colonel looked toward my side of the shanty for a reply, "there are several authorities at present and they do not agree in all things, but while they differ, their works usually give as synonyms the nomenclature of other writers. It is only within a few years that anglers have taken much notice of classification, because the means of information were not at their hands and the older angling writers made a muddle of describing fishes. My first attempt to determine fishes by aid of a book was made with a pike and Frank Forester's "Fish and Fishing." I looked at his plates of that fish and mascalonge and thought the fault was mine in failing to determine which fish was before me. It never occurred to me that the author did not know the difference, as I believe now. These two fishes now before us, which the Doctor calls 'some kind of perch,' are very far from that family. All fish which may properly be called perch or bass have hard rays in the dorsal fin and one or more in the anal, and they are stiff and sharp and will wound the hand. These, on the contrary, have no spinous rays anywhere, the first ray of the dorsal being hard but not sharp, and having a single dorsal fin and no teeth on the jaws, are members of the great family of *Cyprinoids*, to which belong most of our so-called 'minnows'. This family in Europe contains many species large enough to attract the angler, while in America only two or its members grow to any size, and these are before us. The smaller of the two, with the black spot at the base of the dorsal fin and the horny tubercles on its head, which are shed in summer, is variously called chub and horned dace, and is the *Semotilus corporalis*. It is, as you see, nearly a foot long, and is a greedy fish and fair fighter. In many countries it would be esteemed as an angler's fish, but in America only three or four fishes are deemed worthy of our steel, and the rest are left to the boys. This is a splendid specimen, and about as large as it ever grows. The larger one is also called chub and also fallfish (*Semotilus bullaris*). It lacks the dorsal spot, and has larger scales than the other. This fish is fully thirteen inches long, and I think it grows to be sixteen. I have taken it with the fly in Virginia and found it fine sport. There are other differences than those mentioned, but it is not necessary to go into them here. This last fish carries stones to make its nest, and piles up quite a mound of them."*

"Well, how about the sucker?" asked Jack, "give us a lecture on him."

"This sucker is the most common of all its family, and there is not much to say of it. It is called 'common sucker,' 'white sucker,' etc., and is *Catostomus teres*. How did you take these fish?"

"The chubs were taken on one of the Doctor's small hooks," said the Colonel, "baited with a small minnow, while the sucker took in the tail of one of those crawfish which you brought in yesterday. There must be other fish in this lake, and some day I intend to try that bunch of lily-pads, near the north shore, for perch or pickerel. So far we have only fished in deep water for lake trout."

"Did you find your place by the ranges given?"

"Yes; no trouble about it. I wonder now how I was so stupid as to doubt it; but it was a new thing that never occurred to me before."

"Tell us about the stream," said the Doctor; "I want to learn if there is a chance to wade and fish, for I am tired of boat fishing."

"Doctor," said I, "the stream is wadeable, as far as we saw it, and I may try it with you some day just for a change, but when you get to be as old and as lazy as I you may think as I do, that boat fishing is the best of all fishing. I can sit in a boat and cast my fly, and when tired can stand up and cast, but while always ready to work with my arms I can say that I hate walking of any kind, in water or out. This may be owing to my build, which is better adapted to sitting down than to foot-racing, but I can truly say that it never hurts my feet to sit down."

"And I," said the Doctor, "can as truly say that I would rather walk twenty miles than to row five, as I have seen you do. It is my legs that are industrious, but my arms too lazy for all exercise except fly-casting, and when I begin it in the spring my biceps gets dreadfully sore. However, we will try it some day."

"All right, gentlemen," chirped the Colonel; "you may wade if you like, but none of it for me. I am quite an enthusiast on the subject of fishing, but to enjoy anything, whether it be fishing, the opera, or a dinner, I must be comfortable both in mind and body; and to have my feet in icy water and the sun broiling down on my head at the same time would be like listening to a prima donna when, like *Iago*, I had a 'raging tooth.'"

"I agree with you, Colonel," said I, "and the only alternative is to use wading boots, which may be the lesser of two evils if one only thinks so. Whether it is best to cut slits in the toes of our shoes to let the water out, or to wear rubber boots which come to the hip and retain the perspiration, is a question. In one case it means rheumatism and in the other a train of minor ills that, like Byron's shaving, balances the account." Fred Mather.

GAFFING A STURGEON.

"Acti labores jucundi."—*Latin proverb.*

"Labor done is pleasure won."—*New Translation.*

OUR two small yachts, out for a couple of weeks' cruise, were stormbound, having found a lee in one of the many bays of Long Point which are sheltered from the lake (Erie) by either a bar or marsh. Going on shore for a constitutional in the evening, we happened to find a fishing shanty during our walk. We found that its occupant intended going out to his sturgeon lines as soon as the sea went down. The gale had blown for twenty hours right on shore, and raised a nasty sea, which prevented any one visiting the lines during that period. We at once volunteered to man his yawlboat and take the fisherman out, but, although very desirous of going, he declared it almost impossible to gaff any large fish with so much sea on. I, half jokingly, yet half in earnest, volunteered to gaff all the sturgeon on his line if he would take my oar. I fancy the man anticipated some fun, and thus acquiesced.

After a thorough drenching in the surf, which, however, had gone down considerably by this, we launched the boat, took our places in her, got clear of the breakers, were into the swell and riding easy. I felt quite important as I stood in the bow, knowing that so much depended upon my skill, nerve, and strength (although I did not realize the quantity of each required), in capturing something I had never attempted or seen done before. I believe I quailed a little, just when a larger wave than usual threw our bark almost out of the water and myself almost into it, because I thought with philosophic truth that if such a thing should happen while I was leaning over the side with about a hundred pounds of extra inducement beckoning me to come out, I should have to obey. However, while I was grazing my shins against the forethwart, in my descent to the bottom of the slippery boat, I noticed a few smiles from as many half-turned faces, and from that moment determined to make a fool of myself no more.

The leemost fishline buoy is reached. I grabbed it and followed the line hand over hand. Very soon it began to come heavy and rise perpendicular. I thought at first I had got hold of the anchor end, but was assured by our "wiser head" that 'twas a fish. Pulling very slowly and cautiously, as if afraid of frightening the poor thing, but not so much so as not to disturb him, for he commenced to act like a small Georgia mule, which started me thinking and wondering, "If this is what he can do in twenty feet of water what will he accomplish when I get him at arm's length." I allowed no intimation of my thoughts to escape me, so none knew how taken aback I was on seeing this whale hove to right under my nose. When within easy reach I seized the gaff hook and began picking at it, without any effect, for the hook just slid over him. "Hit him hard," sung out the fisherman. I did so, but at that moment my antagonist had placed two or three feet of water between us, and so my endeavor was merely sufficient to prick him, as a spur would a mustang, and cause him to move round rather lively for a while. Chagrin is a powerful incentive, and caused my ire and muscle to rise, so that when my friend showed his face again on the surface, I let drive. It would have been all right that time, only the hook was the wrong way, and I fear the poor fish had a terrible sore eye and nose after it. This was sufficient to stun most things, but not him; it was merely the signature to a new lease of life, and he made the most of it.

The next time I was successful, and buried the hook well into his waist, just a little abaft of midships, and held on. I pulled and so did he, and I found we were well matched. I did not know how this novel "tug of war" was going to end, nor when exactly. In about ten minutes I felt sure he would turn the scales at a ton, and I was about to ask the crew to clap on a watch tackle, or make some other absurd request, when I came to my senses. My position is worthy of notice. My knees were braced against the planking till I thought I should start them. My back got such a kink in it as to be a fit subject for carrying in a sling; my arms were fearfully strained by reason of pulling with that outward tendency so much harder to endure than a straight up and down haul. My eyes, being so intent on watching my captive, had necessarily at the same time to watch the coming and going, the rising and lowering of every wave, which began to act like a pump in my nausea box, and would forever lower me in the estimation of the crew.

I am proud to say I neither gave in nor let on. I just let the perspiration run, the fingers cramp, the back gripe, the knees grind, and attended to the solid avoirdupois outside. I succeeded at last; he came in, although he had his revenge in doing so, for as he slid into the bottom of the boat he made a skating rink of it, with material more slippery than greased ice, down which I went as if determined to follow him to the bitter end.

This was my first as well as my worst. I gaffed ten more that evening, but I hooked the others nearer the bows of the fish than the stern; and if ever you have occasion to educate greenhorns who wish to go sturgeon fishing in a heavy sea, lay down, as a first principle, the rule "gaff as previous as you can behind the head."

I think I was deserving of the congratulations I received, for I did not make a miss with eleven fish, which totaled more than as many hundred pounds in weight. VERAX.

PORT ROWAN, Ont., Feb. 5.

LAND-LOCKED SALMON.

[*From Report of the Maine Fish Commission.*]

WE have expended more of our slender means for the last two or three years, in trying to protect this magnificent fish of Sebago Lake from the organized gang of poachers that destroy them on their spawning beds on Crooked River and other tributaries, than we could well afford. Were these fish better known, this lake would be more visited than even Dominion waters, and with the same outlay of time and less money, with as great success. Sebago Lake is worthy a special appropriation from the city of Portland or the railroads running into it for its protection from the vandals that line its shores, as an investment that would repay a hundred fold in attracting travel. The habits of the fish have not been carefully studied by the local anglers. We do not deem them more shy than are salmon always in dead waters, even on the best salmon river. We do not believe they have been fairly and persistently tried with the fly. We ourselves have never had time to devote to it of more than one individual day. On the best salmon rivers we have known of successive blank days, without a rise to the most tempting flies the angler's book would afford. Experienced anglers would attribute the inertness of the fish to climatic causes, the premonition of approaching storm and in most cases with correctness. Sebago Lake is worthy the persevering study of any good angler, and we think with surety of reward. Trolling, always in a light wind to ripple the water; trolling by night should also be tried; casting the fly by night; deep fishing with fine tackle and live bait. It is worthy of a season's study and trial. Beautiful as Lake Como for a cottage home.

Some very large land-locked salmon have been taken in the spring at the mouth of Songo River. A poacher was last year arrested and convicted for spearing a salmon of twenty-four pounds weight on Crooked River. An account comes to us to-day of a salmon found stranded on the banks of Roger's Brook, which measures thirty-seven inches in length and weighed twenty-two and one-half pounds; as it was somewhat shrunken from long exposure, it was estimated that when first out of water it would have weighed thirty pounds. The Grand Lake or Schoodic salmon is very much smaller than that of Sebago Lake, four and one-half pounds being deemed a monster fish, while the average would not exceed one and one-half pounds. Both the Schoodic salmon and the Sebago salmon have free access to the ocean, and in both lakes have *Salmo salar*, or sea salmon fry been freely introduced for some six years past. In this connection we here publish a copy of an old document for which we are indebted to J. F. Pratt, M.D., of Chelsea.

To Honorable the Senate and House of Representatives of the Commonwealth of Massachusetts, in General Court assembled:

The petition of the subscribers inhabiting near Crooked River humbly showeth that in said river is a kind of trouts of an uncommon size, weighing from three to fourteen pounds. Some have been caught which weighed seventeen pounds. These fish run up the river in the months of September and October, but are scarce at all other times of the year. They have been, and might continue to be, very beneficial to all who inhabit near said river, which runs from a pond in Oxford, near Bethel southerly line; from thence it runs through said Oxford and through Waterford, a part of Norway and of Philip's Gore, Otisfield, and a part of Raymondtown into a gore between Raymondtown and Flintston, where it falls into Songo River, and with it into the Great Sebago pond. These fish have for several years been prevented from passing up said river by wares built wholly across the water by the inhabitants near the mouth thereof, and as there is no law to prevent them, they not only boast of having availed themselves of all the benefit of the fish in years past, but declare they are determined to do it in future, to the great injury of the other inhabitants above them, who have (or ought to have) equal right to the benefit of the fish. We therefore humbly request your honors to take the case into your consideration, and to make a law for preventing the obstruction of these fish in said river and its connections in the months of September and October, and as in duty bound will ever pray. (1800).

Both at Grand Lake stream and Sebago these fish have been always called trout, indeed at the latter are known by no other name, black spot and red spot indicating land-locked salmon and brook trout. These fish have proved a great success in Moosehead Lake and in Rangeley waters. In the former they are taken more or less every season; one of four and one-half pounds and some of smaller size have been taken the present year. As in Moosehead none but Schoodic fish have been planted, four and one-half pounds, if correctly reported, would indicate increase of size from the present stock. In Rangeley, salmon of four and one-half pounds have been taken, and on the spawning grounds in 1882 a number of very large fish were observed that were estimated at much greater weight. Here we are in doubt as to the increase of weight from present stock, as some fry from Sebago were planted in Rangeley waters several years since.

How to class these fish, amid all this conflicting matter, we are still in doubt, but as none but Schoodic fry have been introduced into Moosehead Lake, we must look there for evidence as to increase of weight in new waters. We shall continue to introduce these fish into both Moosehead and Rangeley in as large numbers as our restricted means will allow, until we have established a sufficiently strong breeding stock to afford the yearly supply of young fish to constitute their future breeding home. The rule then should be rigid enforcement of the laws, for the most skillful and persistent angling with baited hook or flies, will never exhaust the fish of any waters. Rigid laws enforced, will always preserve a sufficient stock. The cunning of fishes is coeval with the angler, and the education of experience will preserve its ratio with each. A strict observance of close time, and fair honest angling, is only requisite. We planted this year 225,000 fry in the following waters: At Moosehead Lake, 100,000, hatched at the excellent hatchery of O. A. Dennen, near the Kineo House, in charge of Capt. Brown. At Rangeley, 100,000 at the Oquossac hatchery, in charge of T. C. Hewey. At Enfield, 25,000, in charge of A. J. Darling. These last were divided between Island Pond, Molunkus Pond and Cold Stream Pond. It is a subject of common observation, that these beautiful fish do not now frequent in accustomed numbers certain favorite localities on Grand Lake stream, where they formerly abounded. This has led to the hasty conclusion that they are lessening in numbers, and the cause attributed to artificial spawn taking. The region of Grand Lake, so near the boundary of two distinct governments, would naturally make its wild recesses of forest the favorite resort of questionable, or rather unquestionable, characters from all sources. The poachers of every possible grade exist in numbers only equaled by black flies, and as deserving of extermination. Again, angling is now a mania, a fashion, and five hundred fish where formerly but one cast his fly. Fish have their pastures, their feeding grounds, the same as our domestic stock. Destroy the feed of a pasture and its stock will abandon it and go elsewhere or starve. Certain flies are bred on the bottoms of rivers amid the gravel and earth. Cover this bottom with tan-bark or shingle waste or sawdust and the bottom of the river no longer produces food for fishes; the fly bred from the egg or worm that the bottom of the river supplied with the congenial element no longer rises there; the fly that hovered over its surface to deposit its eggs that begat the worm and in turn the fly, no longer tempts the fish. Streams that formerly bred shad by millions, cannot now feed one, even if millions were there planted, for the river, now bottomed by poisonous sawdust, produces no food for the baby shad to support it on its way down to the ocean. A factory on the river's source may make a fortune for its owner, even if not allowed to destroy all the fish in the water that runs below his mill. He may not make it at so little trouble, but has he a right to do it if he deprive a family even of one meal of food a week?

In response to many letters from Aroostook and other sources, asking relief and redress, which we are unable to afford, we will propound to our legislators the question, "If a stream running through a section of country supplies both food and recreation to the inhabitants, has any one a right, by establishing a factory upon its sources or its shores, to so poison its waters as to destroy the fish and thus deprive others of the value of the food destroyed?" Is not even the beauty of a stream running through one's land a consideration of price and value? Has as any one a right, by establishing a factory above one's property, to destroy its beauty by throwing waste into it, or its fish by emptying the washings of a starch or other factory into it? Industry and ingenuity have a right to their reward, but not at the price of the food, or the value of the beauty of the humblest homestead.

THE BEST COLOR FOR LEADERS.

Editor Forest and Stream:

I have been greatly interested in Mr. Wells's able article on the color of leaders. His suggestions appeal to all anglers, and I feel confident that there are very many among your readers who could, "an' if they would," give other bits of experience, which would be extremely useful to them.

I notice that in your Game Bag and Gun and your Canoeing columns, especially, your correspondents are constantly volunteering hints and advice to others, while in the angling column I see nothing of the kind. Can it be that anglers are less generous than other sportsmen, and are unwilling to aid their brethren by their own experience and experiments? It looks a little like this, and I cannot believe that this is true. Yet, my purpose in sending you this note is to inquire of Mr. Wells, whether his experiments were conducted quite in the way to acquire the best knowledge as to how differently colored leaders appear to the trout in the water. What I mean is this. The fish and the leader are both in the water, and only this medium intervenes between them. The former sees the gut through only the water. In Mr. Wells's experiments, however, he saw the leaders in the first case through air, glass and water, and in the other through air and water. Might not these different media through which the visual rays passed, make a difference in the color appearance of the gut? I put forward this opinion rather timidly, for I feel that I do not know enough about the subject to discuss it intelligently, but I have vague recollections of college text books, which spoke about these matters. The rays from the eye would pass directly toward the object through the air, but when they impinged upon the water, would be deflected so that the object would appear to occupy a position which it did not have. Whether or no the fact that the eye looked into the water from the outside air would make any difference in the apparent color of the gut, I do not know, but would it not be worth while to look at it merely through the water, that is with the eye immersed?

In order to acquire the best possible notion of how the leader looks to the trout or salmon, we should, it appears to me, try to make all the conditions under which we look at it, as nearly as possible, like those to which the fish is subjected.

I should be glad to see this subject further discussed by Mr. Wells, and others as able as he. If this be done, anglers everywhere will be benefited.

The points I have mentioned are no more than suggestions, and as such, I submit them to those who are wiser than I.

NEW YORK, Feb. 7. COUPLES.

1. ONE IN SEVEN of those insured under the Accident Policies of The Travelers, of Hartford, Conn., in 1883, was killed or injured by accident, and received cash benefits.—*Adv.*

THE SAGACIOUS CATFISH OF WASHOE.—The catfish of Washoe Lake having all buried themselves in the mud at the bottom, therein holding themselves in a semi-dormant state, refusing to heed the beguilements of the angler, some miners the other day concluded to play them a trick. The men, at the suggestion of one of their number, who said that in winter catfish always remained buried in the mud until they heard the first thunder in the spring, exploded a giant-powder cartridge on the shore. Sure enough, the fish thought they had heard it thunder, and swarmed to the surface. The men were delighted with the success of their experiment, and were about preparing their hooks and lines when a new movement among the fish attracted their attention. As though some signal had been given or word passed, every catfish, great and small, turned toward the Sierras, stuck his head out of the water an inch or two, took a long look, then disappeared beneath the waters of the lake—went down into the mud again. The miners now fired half a dozen cartridges—all they had with them—at various points around the lake, but not a fish showed itself. They had all taken a good square look at the Sierra Nevada range, and had seen that it was still white with snow.—*Virginia (Nev.) Enterprise.*

FISH AND GAME IN VIRGINIA.—Norfolk, Feb. 5.—During the last week of spring-like weather, the rockfish (*Roccus lineatus* and not *chrysops*) have begun to run up the Elizabeth River, and a few are caught daily in purse nets, all in excellent condition, hard and fat. The run is of much larger fish than those of last fall and early winter, when they were abundant, but seldom heavier than two pounds, the great majority falling far short of one pound. We are getting them now up to nine pounds weight, a female of seven and a half pounds having roe developed about as large as a man's finger. No salt-water fish in the market; of fresh-water kinds none but inferior sorts, viz., perch, brown, speckled and yellow, black bass, called chub here, and small pond pickerel. These fish are all caught in ponds, and are very inferior to the same fish of the North. Of game, the market is well supplied during this warm weather with canvas-backs, mallard, widgeon and black ducks, none, however, in very good condition. With thermometer down to freezing, all of the best ducks go to New York. A few rabbits and squirrels make up the list.—PISCO.

BASS INJURED BY FRESHETS.—Mechanicsburg, Pa., Feb. 9.—Owing to the high water in the Connoduguinet Creek, and the consequent breaking of the ice, quite a number of large bass have been washed ashore, the majority of them being more or less injured. Some of our fishermen have taken advantage of this opportunity to secure said injured fish, and it is a question with our game protection sportsmen whether the gentlemen are legally allowed, under existing Pennsylvania State laws, so to do. I await your answer.—R. S. [As the laws of Pennsylvania forbid the taking of bass at this season and only allows them to be taken with hook and line at any time, we think their capture in the manner stated is illegal. At the same time, it seems to mitigate the offense if the fish are injured so badly as to be strewn on the shore.

A FISHING DOG.—Oxford, Feb. 2.—*Editor Forest and Stream:* This is too good a story to keep. While Fish Warden Pettingill was at Oxford, investigating the recent violation of the fish laws, he wished to buy a foxhound of Louis Edwards, a well-known fox hunter of this place. The hound was let loose from his kennel for inspection. He immediately got over the fence and returned with a good-sized trout, which he laid at the fish warden's feet. You can imagine the feelings of his owner, especially as he is not a fisherman, nor has he been fishing this winter. The fox hunter has not been near the village since.—JOSH JEEMS.

FLY-RODS LONG VS. SHORT.—In ten years' bass fishing I have found that a rod of 16 feet would catch more fish than one of 11 or 12 feet; it has proved so with both rods in the same boat, the long rod in stern, casting on same side of the boat, and consequently fishing over water partly worked, also in following boats using short rods. Therefore I am in favor of long rods, and would be pleased if your readers having two-handed rods would give weight, dimensions and timber, dimensions at ferules and also between joints.—R. H. DIXON.

GRAYLING AND TROUT EGGS.—At a recent meeting of the London Piscatorial Society, Dr. Brunton read a paper, which tended to prove that if the grayling fed on the eggs of the trout at all, it was to a very small extent. He had on the previous Saturday taken several grayling from immediately below the scours on which trout were spawning, and had carefully dissected them immediately after capture, without finding any trout eggs.

SALMON FISHING WANTED.—"West Chester" asks: Can any of your readers inform me where a novice can find good salmon fishing for ten days or two weeks at not too great cost, and what will be the license fee, the route, approximate expense of the trip and the time necessary, allowing two weeks on the stream?

PENNSYLVANIA ANGLERS' ASSOCIATION.

[An address read before the Anglers' Association of Eastern Pennsylvania at its annual meeting by A. M. Spangler, President.]

IN accordance with the request of the Association at its last meeting, I have prepared some remarks in regard to the operations and obligations of the Anglers' Association during its single year's existence, though I have not attempted anything like a detailed statement. That duty properly belongs to the Executive Committee, whose first annual report will be submitted to-night, and which will contain full information on those points.

My special object in the preparation of this paper has been to present for your consideration a few plain suggestions in regard to the course, which, in my judgment, the Association should pursue in order to more effectually secure its primary purposes, namely, "The preservation, protection and increase of edible fish, and the enforcement of the laws concerning the same."

If these suggestions, or others of equal or greater value, are adopted, salutary results must inevitably follow, and a great public good be achieved.

It is only a few years since the importance of fishculture and fish protection first began to be thoroughly impressed upon the public mind of this country. European nations had long before recognized and appreciated their true value, and with commendable prudence made adequate wholesome provision for checking the improvidence that had so nearly depleted their waters. This was accomplished by the only two seemingly possible methods—the enactment and enforcement of stringent protective laws and liberal appropriations for propagating purposes. I need not state that those nations are to-day reaping a rich return for their investments.

It was not until the veteran Seth Green and a few others,

by vigorous writing and repeated successful practical experiments, satisfactorily demonstrated the entire feasibility of artificial fish propagation, the restocking of exhausted streams, and the imperative necessity for such legislation as had been found needful and wholesome in Europe, that the generally prevalent apathy on these important subjects gave way to a marked feeling of interest. Up to that period the whole country appeared to have imbibed the idea that either our edible fish supply was inexhaustible or that fish propagation and fish protection were matters too trivial in importance to merit public attention—subjects fitted only to interest and amuse the few earnest and sanguine men who had been giving them so large a share of their time and attention.

But such indifference could not last forever. In the very nature of things, it was certain, sooner or later to find its limit, unless the people and their legislative representatives were willfully determined to bind themselves to the cogent facts which were so persistently forcing themselves into conspicuous notice, and the logic of which was almost irresistible. Gradually, but surely, the conviction that something must be done and that speedily, asserted itself. It needed no argument to convince those disposed to give the subject thoughtful consideration, that almost without exception, the waters within the limits of the then settled portions of the country, had been improvidently drained of their finny inhabitants, and that unless prompt and decisive measures were adopted, the day was not distant when our indigenous edible fishes, once so abundant and so nutritious, would, from their scarcity, become veritable curiosities.

Eminently successful experiments in artificial propagation and the clearly demonstrated fact that the streams exhausted of their fish could readily be re-stocked, and at a comparatively trifling outlay of money, gave additional healthful impetus to this conviction. Social economists became earnest advocates, and the need for prompt action almost imperative. Demands for the appointment of fish commissions, the artificial propagation of edible fish, and the stocking of streams with such as would afford, in proper season, remunerative employment to the professional fisherman, sport to the angler and wholesome food for the table, came up from every section. These were supplemented by others for the enactment of laws that would give protection to the great interests which were about to be re-established.

The responses to these demands were in the highest degree encouraging. Beginning in 1866 with Massachusetts and Connecticut, closely followed by Vermont, New Hampshire and Maine; these in turn by Rhode Island, California, New Jersey and Pennsylvania, and finally by all the States except Alabama, Tennessee and Oregon, with nearly the whole of the Territories, fishculture appeared to enjoy almost universal popular favor.

Pennsylvania's first commissioners were appointed April 15, 1866, and the first appropriation for general purposes amounting to $18,080, made in 1873. Appropriations in varying amounts, were continued from that time up to 1882, when the sum of only $7,500 was granted. The aggregate was $114,000; but in addition, several special appropriations for fishways, amounting to $30,000, were granted; but only $20,000 was expended, as some of the later appropriations depended upon the unqualified success of the fishways that had been previously constructed. The belief in the entire success of these passageways for shad, is not entirely unanimous, though those erected under the direction of our State Fish Commissioners, have as nearly met expectation as any constructed elsewhere, either in this country or abroad. Adding these fishway expenditures to those for general purposes, and we have an aggregate of about $134,000, placing the Keystone second on the list of States, in the matter of encouragement to fish propagation and protection, New York being entitled to the first, her appropriations for like purposes amounting to $240,000. The sum total of the various State and Territorial appropriations from 1866 to 1882, inclusive, was $1,110,096.

In 1873 the United States Fishery Commission was established by Congress. The sum set apart for its use in the beginning was ridiculously small, amounting to only $8,500, but it was annually increased thereafter, until in 1882-83. it amounted to $229,000; the aggregate for the ten years being $1,190,955.45. This sum represents investments in the form of hatching houses, apparatus, ponds, salaries, etc., together with the purchase of three steamers for the special use of the Commission, and preparations for the national exhibit at the London Exhibition in 1883.

The sum total appropriated by the National, State and Territorial governments, during the period named, was $2,292,051.45. When this large amount—an exceedingly small portion of which was expended in salaries—is considered, and in connection with it the restrictive and protective enactments of Congress and the several States and Territories, a natural inference would be, that the country was in a fair way to have its streams and lakes literally teeming with the choicest of food fishes. It needs not the telling that such is not the case, or, that with a few exceptions, the United States are not greatly better off, as far as the supply of food fishes is concerned, than in 1866.

These facts, thus concisely presented, bring us fairly face to face with the question: With such ample facilities, why have we such meager results? As has been shown, millions have been appropriated and expended for fish propagation within the past ten years, and we should have valuable results, in some unmistakably tangible form. We have results, but they are not commensurate with these large outlays of money and labor.

Fish have been artificially propagated by hundreds of millions, and protective laws of the most stringent character enacted, but the waters yield no adequate return. Why not? Simply because the protective laws have not been enforced. There are several reasons for this non-enforcement. Officials sworn to support those statutes, have not only foresworn themselves by neglecting that duty, but worse, in many well-attested instances, have been proven comparceners with those engaged in open violation of them. The fishery laws, save in some exceptional cases, have therefore been mere nullities. They are practically so to-day.

Private citizens are not willing to play the ungracious and unpopular part of informers upon their lawless neighbors, and many county officials wink at proceedings which may appropriately be designated as great public wrongs. The fault is not in the laws, but with the people and the officials.

The aversion to becoming informers appears to be insuperable. Men who have volunteered to give evidence in cases of poaching, have been boycotted or threatened with personal injury, and in consequence, few are found willing to incur such penalties for the mere sake of having laws in which they are no more interested than their neighbors, respected. How then are these difficulties to be surmounted? If officials are faithless to duty, and private citizens refuse to interfere, then organized associations must assume the task, or the admission be made that fish protection, through the intervention of law, is an impossibility.

It was in view of such a conclusion that "The Anglers' Association of Eastern Pennsylvania" was formed. A dozen gentlemen met a twelve-month ago, organized, and adopted a constitution and by-laws. The purpose of the association is clearly defined in the first article of the constitution, which declares that "the primary object shall be the protection and increase of edible fish in the waters of Pennsylvania, and the enforcement of the laws concerning the same."

Necessarily, the operations of the association have been limited. Starting with a mere handful of members, and with a treasury as empty of money as the streams of fish, it was not to be expected that much would be accomplished until the organization had "lengthened its cords and strengthened its stakes." But notwithstanding this primitive weakness, the members have pressed the good work with untiring zeal and energy, and it affords me great pleasure to state, with prospects of eminent success.

The membership during the year has increased to more than two hundred, and is still growing, comfortable headquarters have been secured and nicely furnished, and as the report of the Executive Committee shows, a number of streams in the vicinity of the city, and in some of the northern counties, have been stocked with trout; detectives have been employed to secure the capture and conviction of persons engaged in illegal fishing, and rewards offered for such information as will lead to the exposure and arrest of offenders of all kinds against the fishing laws. Although none of the lawless parties have yet been brought to justice, the effect of these measures has been very salutary. In a number of sections of the State, where fishing with seines, fyke-nets, fish baskets, weirs and other unlawful devices, as well as with hook and line during the close season, was openly practiced; the posting of the Association's placard, and the suspected presence of detectives, have had the effect of intimidating the wrong doers, and greatly lessening the amount of illicit fishing. This is encouraging.

But much yet remains to be done. We have only made a fair beginning, but with reasonable prospects of ultimate success, if we diligently persevere. If violators of the fishing laws are taught to understand, by practical demonstration, that the association is in live earnest, and that it means to press the good work in which it is engaged until the authority of the State laws is fully acknowledged by a respectful observance of them, the men who have hitherto been setting them at defiance will pause and reflect upon the possible consequences before indulging in further infractions. That will be a great point gained, for the association, through its correspondents, has reliable information to the effect that in the upper waters of the Delaware, throughout the almost entire length of the Susquehanna, in the Schuylkill, Perkiomen, Lehigh, Brandywine, Juniata, and in fact in nearly all the bass and trout streams of the State, the fishing laws are defiantly violated. It has directed official and general public attention to such pregnant truths, and has energetically labored, with the limited means at its command, to counteract these most reprehensible practices.

"Rome was not built in a day," nor can we reasonably hope to accomplish the reforms at which we are aiming in a twelvemonth. They amount almost to a revolution, for attempt to disguise it as we may, there is no such thing as getting away from the fact that public opinion in the rural districts has undergone a marked change for the worse, in regard to the fishing interests of the State.

When the subject of fish propagation was first introduced, it was received with general favor. The successful practical experiments of Seth Green and his coadjutors, had satisfied even those who had been most incredulous, that the artificial breeding of food fishes was feasible. Public expectation was therefore largely excited. When hundreds of thousands of small fry were placed in the streams of the State, the confident expectation and belief was, that in the course of four or five years, the re-stocked waters would teem with edible fish, and that all who so desired, could have them in abundance, at the mere cost of catching. So they would, had the wise provisions of the fishery laws been observed. But they were not, and are not. In most instances, they are as completely disregarded as though they had never been enacted. Worse than that, as already stated, in a number of well authenticated cases, county officers who attempted the destruction of dams and other illegal devices for capturing and killing fish, were openly resisted and their lives threatened. This warfare upon, and overturning of the work done by the Fish Commissioners, began as soon as the young fish had attained fingerling size, and this discreditable spirit is asserting itself as boldly to-day as at any former period since the re-stocking of the streams of the State was begun.

Is it surprising, then, that there should be a revolution in public sentiment, that tax payers disheartened by this decade of virtually fruitless experiment and waiting, have become weary and disgusted, and that there is sturdy opposition to further appropriations? And yet there is no real cause for despondency. True, the anticipations of the great mass of the people have been disappointed; but the fact remains, that although the increase of edible fish has not met expectation, there has been a practical re-stocking of all the waters of the State, and, that if it be possible, either by enforcing existing protective laws, or by procuring such additional legislation as will make fish-poaching a misdemeanor, punishable with imprisonment as well as fine, the desired result will ultimately be attained. Ten years of freedom to the fish now in the streams of the State to multiply without let or hindrance, is all that is needed to fill those waters with the finest edible fish in the world. If all the fish dams or baskets now in the headwaters of the Delaware were destroyed, and unrestricted freedom given to the shad to spawn, and to the young shad to migrate to the south in their season, the supply would be equal to almost any conceivable demand that would be made upon it. Instead of being compelled to pay, as the people of Philadelphia have been doing for many years, from forty to sixty cents for a fair-sized shad, it is hazarding nothing to assert, that fish of equal size and quality would be profitably sold for less than half the price named.

The question for the thoughtful consideration of the Association, is, what remedy, if any, have we at command? A specific is provided in existing laws, could they be rendered practically operative. When it was proposed to the rats in council assembled, to put a bell on their mortal enemy, the cat, the proposition was received with tumultuous joy, but the old dread revived when a venerable member of the assembly gravely inquired, "Pray, who is to bell the cat?" That is the problem, we, in common with all the friends of the fishing interests of the State, are now called upon to solve. If, as past experience has so clearly demonstrated, private citizens will not become informers, and officials will not perform their sworn duties in regard to violations of the law, we must seek for other aid.

The education of public sentiment is one of the remedies I would suggest. Not many years ago, insectivorous birds were generally regarded, either as nuisances, or at best, worthless, except for food. Instead of protecting them, farmers, in many cases, encouraged their destruction—frequently by lending a helping hand. But when their grain crops were devastated by vermin, their fruits destroyed, and their incomes, in consequence, seriously lessened, they began to look around for the cause and its remedy. Science assisted in the search, and very soon demonstrated that the immense multiplication of crop-enemies was due to the wanton destruction of the birds. What was the result? Laws for the protection of the badly used little friends were enacted, and as farmers had learned, by costly experience, that they had a direct pecuniary interest in having those laws observed, their own guns were laid aside; the pot-hunters who traversed the country, invading private property and slaughtering birds of every description, were driven away; respect for the close seasons was everywhere manifested, and they are receiving their reward in the form of improved crops and the presence and songs of the unselfish feathered friends, who, only a little while before, they were endeavoring to destroy. It was the *argumentum ad crumenam*, the potency of the mighty dollar, that wrought the change.

Now, to my mind, the money value of the fish interests of the State is as readily susceptible of convincing demonstration. Fish food, instead of being a staple article of daily consumption, is little less than a luxury to those of humble means. The workingman cannot afford to place it on his table except at occasional intervals. It is more costly than beef, and in addition, were the demand very materially increased, the supply would be inadequate, for it is a rare thing that fresh fish are so abundant in the Philadelphia market or elsewhere, as to cause a glut, or even any marked decline in prices.

Though without positive data, I do not hesitate to assert as my confident belief, that if the edible fish now in the waters of the State, were allowed to propagate unmolested for ten years, or even five, and that, if thereafter, the protective laws were enforced as they should be, the annual gain in the form of wholesome and nutritious food would exceed a million of dollars. If my conjecture is even approximately correct, has not every citizen a direct pecuniary interest in the matter of fish protection? and if this were clearly demonstrated, as it so readily can be; would not each one instinctively feel that he had an indisputable right to a share in the products of the State's waters, and that those who infringed the protective laws were defrauding him of a portion or perhaps the whole of his rightful dividend? Therefore, one of the first and most important steps to be taken is the education of public sentiment in the direction indicated. Let it be shown that this immense annual addition to our animal food supply, can be had almost without cost. The investment has already been made. The stream are sufficiently stocked now. Give the fish fair play. Let them alone for a few years, and the increase will come as certainly as that day follows night. Impress upon the popular mind another simple truth, namely, that in order to maintain this abundance, the only requisite will be the adoption of the course so successfully and profitably practiced towards the birds—protect them.

But where shall this educational process begin? With the printing press of course—with the newspaper, the magazine, and statistical facts in form of printed documents liberally distributed. The people must be taught that the "the gods help those who strive to help themselves," that if they would have fresh fish in abundance they must unitedly assist in protecting them against both open and secret enemies. They must be taught to regard every man who kills edible fish out of season, or by illicit means at any time, as a public enemy. They must be confronted with such startling truths, as that a single fish-basket in the spawning waters of the Upper Delaware, causes the destruction of a great number of young shad than are taken full grown in an entire season, by one-half of all the fishermen on the Delaware River. It may sound improbable, but I give it on no less authority than that of one of the State Fishery Commissioners, that drowned shad, of a finger's length, have been hauled away from such traps by the wagon load, to be converted into manure by farmers in the vicinity.

I have personal knowledge of the fact that nearly every paper, daily or weekly, published in Philadelphia, has pledged the full weight of its influence in behalf of this valuable interest. I doubt whether there is a single one that is not ready and willing to co-operate heartily in the work proposed to be done by the Anglers' Association. With such powerful auxiliaries, the educational process will be begun under the most favorable auspices. What has been said of the readiness of the city press to assist, will as fully and properly apply to the newspapers of the State. Let us begin with them all and begin now.

Again, public sentiment must be educated up to the point of believing that our association was not organized for mere sporting purposes. Sport is one of its cardinal features, but it has others of still higher importance; for, if we would have angling sport, we must have fish, and can have fish only by protecting them, as the law provides. It should therefore be our earnest endeavor to convince every one, that while we are striving to enlarge the means of fishing recreation, we are at the same time laboring to build up a most valuable State interest. There are few men in Philadelphia or the State, who, if made thoroughly acquainted with the character and object of the association, will not cheerfully become members, even though they never caught a fish or expect to do so. They will recognize and appreciate the fact that the organization is purely unselfish, and that if successful, a great boon will be conferred upon the whole people. Some of these will be influenced by the voicings of the press, but the most effectual method is the personal presentation of the association's claims, by the members themselves. All business men know that such an organization cannot be effective in its operations without funds, and all who are possessed of the right kind of public spirit, will regard it as a privilege, or at least a duty, to join our ranks. If they find that there are those ready and willing to give time and effort to the good work indicated, and without other remuneration, either present or prospective, than the consciousness of being in the discharge of a public duty, I shall be greatly disappointed if hundreds who now stand aloof because they have had no proper conception of the real objects of the Anglers' Association, do not rally to its support.

As already stated, the membership has increased greatly in numbers and influence. It is composed of gentlemen of wealth and respectability, and I am pleased to note the watchful care exercised in regard to the admission of members, in order to prevent the introduction of any mischievous element. We want more of this influential material, and we shall fail in duty if we neglect to make the effort necessary to secure it.

There are special reasons why the organization should number its membership by thousands instead of hundreds. First, the funds that would accrue from such accessions are needed; second, necessary and important legislation will have to be applied for. If such application is backed up by a thousand or two of the best names in Philadelphia and vicinity, the granting of it will be at once almost assured. For these and other reasons that could readily be advanced, we need a great many more members; we should and can have them, if those now connected with the Association will act promptly and energetically.

It is an axiom as old as humanity that if we would have others respect us we must respect ourselves. If we preach fish protection and practice fish destruction, our false pretensions will naturally and rightfully earn for us distrust and contempt. It therefore behooves every angler to frown upon practices of every kind that tend to the wanton killing of fish. To some who wield the rod and reel it may seem something noteworthy to be able to boast the taking of a hundred trout, but how contemptible the boast, when, if the entire catch were put in the scales, it would not draw five pounds. There are such pot-hunters—unfortunately, too many of them—who would have the world believe them sportsmen. They have not a vestige of claim to the title. No true angler can possibly entertain for them any other than a feeling of profound contempt, and I am gratified in being able to say that the Anglers' Association of Pennsylvania is free from all such travesties upon sportsmanship.

The Governor must be urged to make pointed allusion to the importance of the subject in his next message, and it is not hazarding anything to say that the request will be cheerfully complied with.

The formation of auxiliary societies throughout the State, or at least in the vicinity of large streams, should be encouraged.

The names of sheriffs and other public officers, who either neglect or refuse to perform their sworn duty in regard to the Fishing laws, should be reported to the proper authorities.

Regular correspondence should be kept up with kindred associations in other States.

There should be a library composed of all procurable publications bearing upon the commercial and sporting fishery of our country and of the world. Measures looking to such a result have already been taken, and can hardly fail of success.

But our efforts at fish protection must not be confined to the waters of our own State. Those of New Jersey, especially the sea coast, have strong claims upon the attention of the Association. The Legislature of that State being foiled in its well-meant endeavors to abolish illicit fishing along its coast, because of lack of jurisdiction, the important subject was im-

mediately and energetically taken up by the State's representatives in Congress, and Senator Sewell has been untiring in his endeavors to have this alarming evil corrected, and with every reasonable prospect of success. The hands of these advocates of fish protection should be held up and strengthened by whatever influence the Anglers' Association of Eastern Pennsylvania can bring to bear upon the subject.

It is not necessary to recite the reasons that should prompt to such action. They are patent to all who have given the subject even casual consideration. To permit the further wholesale destruction of the menhaden fish on the coast, is simply an invitation to those engaged in such wrong to completely destroy the supply of salt water food fishes which has hitherto found its way to our markets. How seriously that supply has been diminished since menhaden fishing has been tolerated, need not be told. What will be its ultimate effect, unless it is speedily abolished by law, may readily be inferred from what has already been realized. I feel that I cannot too strongly impress this matter upon the attention of the Association. Action should be prompt, energetic and decisive. Our protest should be made now, and in language that will admit of no misconstruction.

If it be urged that we are transcending our sphere of duty, the answer is that the wrong is not limited by State law or State boundaries. It is national in character, and hence protests by this Association are not only admissible but should be made by citizens of every State.

Having thus, in a desultory way, complied with the request of the Association, allow me in my conclusion to tender my congratulations to the members for the encouragement they have thus far received. That the most sanguine anticipations of the founders of the Association have been more than realized, need not be said. The future holds out still stronger inducements than the past, for the reason that we are gradually becoming more familiar with the proper methods of dealing with those who have hitherto displayed such total want of respect for statute law. Perseverance works wonders, and if the energy and determination that have thus far characterized the proceedings of the Association are maintained, there are some of us at least, who may live to see the day when the streams, not only of our State, but of the whole country, will yield their harvests of food fishes as abundantly as they did years ago, before the spirit of extermination, now so rife, had attained formidable proportions. This hope is strengthened, as far as Pennsylvania is concerned, by the fact that we are assured that in the future, as in the past, we shall have the hearty co-operation of our own Fish Commissioners, to whom we have been indebted for many courtesies and whose labors in behalf of fishculture and protection have been so damagingly interfered with by the parties to whom frequent and special allusion has been made in these pages. A communication from their Secretary, Mr. McCullough, informs me that they are constantly in receipt of encouraging communications from every part of the State, and that notwithstanding the marked disregard of the fishing laws there is a steady and sure increase.

Fishculture.

PROPOSED ADIRONDACK HATCHERY.

THE following bill has been drafted, and will soon be introduced into the Legislature of New York, by Mr. O'Neil, of Franklin Co. There are many good sites for a hatchery in the Adirondacks, and the eggs of native fishes could there be hatched and distributed without much trouble or expense. The following is the proposed bill:

An Act to establish a fish hatchery in the Adirondack forest:

Section 1. The Treasurer shall pay upon the warrant of the Comptroller to the Commissioners of Fisheries out of any money not otherwise appropriated, the sum of five thousand dollars for the purpose of establishing a fish hatchery at some convenient point in the Adirondack forest, for the purpose of restocking the lakes and streams of said forest with trout and other fish natural to that locality.

Sec. 2. This act shall take effect immediately.

THE EDIBLE QUALITIES OF CARP.

IN his forthcoming book entitled "Carp in American Waters" the treatment of the above mooted question is probably foreshadowed by Capt. Peirce, in the following communication to this paper:

The question is indeed a much mooted one. I have given it all practicable investigation. However divergent the views of fishculturists upon other points, all agree to the unequalled edible qualities of the brook trout when taken from its native habitat. Most fishculturists now also agree to its marked deterioration in flavor when artificially cultivated and fed (as is practically compulsory) on slaughter house refuse.

I was in Boston a few days before last Thanksgiving, which is the "national New England holiday," and was noticing the accumulations of poultry. Of course, the national bird of New England is the turkey, and, it will be remembered by the way, that Franklin maintained it should have been the national bird of the country; however, a more gamy one was selected. Well, as I said, I was noticing the poultry. The turkey had all the "posts" of honor, though a large number "were put to the rack," but the Jersey chicken was next. I was repeatedly informed that New Jersey poultry commanded from three to five cents per pound more than any other in Boston markets. Now, Mr. Editor, I have been spending a large portion of the time since the war, in the leading poultry-raising section of New Jersey. Although the matchless climate of that region may have some effect upon the poultry, its chief superiority is attained by the intelligent culture which obtains there (I do not refer to "culchah" but to the treatment of poultry). The Jersey women have entire charge of the poultry, and "what they don't know about the business, is not worth knowing." The secret of the superior flavor is no secret there. It simply consists in confining the poultry in coops, with slatted floors, raised a foot or two above the earth so that no filth can accumulate. This is done two or three weeks before marketing, and in the meantime they are given only pure, clean food and drink. This changes the entire flavor of the fowl. Of course the dressing of the fowl has also some effect upon the flavor, but the principal factor is its treatment a few weeks previous to marketing.

Now as to carp. Some of my editorial friends seem to think me an enthusiastic old crank, because I maintain that good, edible fish can be raised in warm and even filthy waters. I have told you how poultry, raised even in the filthiest barn yards, is, in a comparatively short time, transformed into healthy and exquisitly flavored food. The same poultry fattened in barn yards and at once killed is not only ill-flavored but positively unhealthy, sometimes fatally so, the same as the ruffed grouse is known to be when it has been feeding upon poisonous birds or berries in winter. Now I propose to apply the same system to carp that the Jersey women do to poultry, even to their slaughter. The Jersey women would not have their poultry slaughtered by drowning or otherwise smothering them, nor would I take fish from the water and allow them to smother and die as is generally done with the fish we eat in this country. But, for obvious reasons I must tell part of the story in my forthcoming book.

MILTON P. PEIRCE.

PHILADELPHIA, PA.

THE AMERICAN CARPCULTURAL ASSOCIATION.—An organization with the above title was formed in Philadelphia, on Feb. 8. The following officers were elected: President, William Parry, Parry P. O., Burlington, N. J.; Vice-President, Henry P. DeGraaf, Bowery National Bank, New York city; Treasurer, Samuel Wilkins, 329 Market street, Philadelphia, Pa.; Secretary, Milton P. Peirce, 323 Walnut street, Philadelphia, Pa. Directors—Dr. S. T. Davis, Lancaster county, Pa.; Joseph Pyle, West Grove, Chester county, Pa.; George Hamel, Sr., Weldon, Montgomery county, Pa.; Jeremiah Comfort, Wm. Penn, Montgomery county, Pa.; Edwin Tomlinson, Byberry, Philadelphia, Pa.; William A. Wood, Pittsgrove, Salem county, N. J.; Amos Ebert, Kirkwood, Camden county, N. J.; Rev. J. H. Brakeley, Bordentown, Burlington county, N. J.; E. G. Shortlidge, M. D., Wilmington, Del.; George W. Hill, Clayton, Del. The office of the Association is 323 Walnut street. It aims to embrace directly and indirectly within its organization every carpculturist in the country, and desires States and local branches organized throughout the country. Its principal object is the dissemination of useful and reliable information among its members. It will cheerfully co-operate with fish commissions, boards of agriculture, agricultural societies, granges, etc. Wishing to respond, as far as is practicable, to the wants or desires of all engaging in carpculture, it invites all interested to correspond freely.

TIME OF HATCHING CARP EGGS.—In the Bulletin of the United States Fish Commission the following extract from a letter written by Dr. H. H. Cary, Superintendent of Fisheries of Georgia, to Professor Baird, appears: "I have been taking some pains for the past two years to ascertain the period of incubation of the eggs of German carp. A statement in your report for 1875-'76 that they hatched in from twelve to sixteen days was doubtless based on a lower temperature of water than prevails in this latitude during the hatching season. Last year, with the temperature of the water at about 69 deg., the eggs hatched in about five to six days. The present year, with a higher temperature of water, a more carefully conducted experiment has demonstrated that the eggs will hatch in from forty-eight to seventy-two hours. The eggs hatch finely in water at a temperature of 90 deg."

IN THE ADIRONDACKS.—The hatchery of the Bisby Club is in complete running order. It has troughs for land-locked salmon, lake trout and brook trout, and has the McDonald jars for the frostfish. The eggs have done remarkably well so far, and notwithstanding the severe cold in that region the spring water has not frozen up, although the air has been 30 deg. below zero on two or more occasions, and the water in the troughs has been steadily at 33 deg. above. The hatching has progressed slowly, with little or no loss after the early pickings, and the fry are expected to be unusually healthy and vigorous.

The Kennel.

FIXTURES.

BENCH SHOWS.

March 4, 5, 6 and 7.—Cincinnati Bench Show, Melodian Hall. Entries close Feb. 25. Charles Lincoln, Superintendent, care of B. Kittredge & Co., Cincinnati, Ohio.

March 12, 13 and 14.—New Haven Kennel Club's First Annual Bench Show, Second Regiment Armory. Edward S. Porter, Secretary, Box 657 New Haven, Conn. Entries close March 1.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. Charles Lincoln, Superintendent. C. Greville Harston, Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **869.** Volume I., bound in cloth, sent postpaid, $1.50.

EXPERIENCE WITH DOGS.

THE intelligence of a dog is identical in quality with that of a human being. Were the quantity of intelligence present in the heads of our canine friends, and vocal organs supplied to assist intelligence, we could take our pets into the field and discuss the events of the chase with the same satisfaction we can now with our human brother.

I have made a companion of a dog for the past twelve years, and my experience teaches me that the same influences which make a child good or bad, dull or bright, also control a dog. My first dog was an English setter, the scrub of a litter, and he turned out to be the handsomest and most intelligent of the lot. My next was a pointer, selected for his color from a litter of twelve, and he proved to be the prize dog of the family. My next friend was an Irish setter, Gyp, the last choice of a litter of eight, and she grew up the brightest of the octet. My next was a spaniel of uncertain parentage, selected from a litter because he had a distinguishing mark which would plainly describe him in case he strayed away, and he took advantage of his bringing up and grew to be a beauty and the envy of my fellow-sportsmen. My next is my present companion, a cross between a spaniel from Burgess's stock and a half-bred Irish setter bitch, and he, now two years old, surpasses all of his brothers and sisters in beauty and courage. Such a uniform experience compels me to conclude that my dogs have been developed, and that my experience will be the experience of others, using the same or similar methods in raising and educating them.

All the dogs I have owned I secured when they were very young. While they were growing I gave them all they could eat, offering them food several times a day. Milk, vegetables, meat, bread, oat and corn bread, and porridge. I never kept them on the chain, but let them romp to their hearts' content. Plenty of food and plenty of exercise gave them form and strength, good constitutions and brave hearts. Their education commenced when they were two or three months old and continued until they came to dog's estate. First they were taught to charge. Next to retrieve (under the whip), then to find. Next to toho, etc.

The great avenue to success in teaching a dog well, is to teach one thing at a time. And as soon as the dog is known to understand an order, to always insist upon obedience at whatever cost of time and patience to the teacher. When my dogs have comprehended the idea I have intended to convey to them, I have accustomed them to listen for my commands by giving them in an ordinary tone of voice, until at length I could carry on quite an extended conversation with them, I giving the signs, vocal or otherwise, and they interpreting by obeying me. Constant intercourse of this nature with one who is kind to his pupil, who encourages prompt obedience and chides delay or carelessness, will change a cur to a humanized companion, a dolt to a being of intelligence.

To raise a fine dog, then—feed him often and abundantly. Never put him on the chain, but allow him to romp at will. Teach him early and often, and make a Jesuit of him to the extent that he may know that his first duty under all circumstances is obedience. The result will be beauty, courage, intelligence, affection and a perfect dog.

I am aware that very few have the time or inclination to raise their dogs in this way, and the result is long pedigrees, and a disappointment for every degree the dog has departed from the routine I have described.

Three years ago I took a mangy looking pup—a blue-blooded but insignificant looking scion of Bolus's Belton—with me into the country to train for a friend. He had been reared on a chain and fed by servants, until he was a coward in spirit and appearance. I kept him with me for two months, permitting him to run wild until he had acquired some courage, and then commenced his education. When he was ten months old his master hunted over him and pronounced him a wonder; and he was. He outran four old dogs, and the third day out was the only dog out of the six we had on the first day that would hunt at all. He worked like a major but was slow, because foot-sore. The year following he was as worthless a dog as ever hustled about among a covey of birds, and on several occasions his outraged owner was tempted to bestow upon him the epitaph, "No earthly good." He had hung upon a chain since his experience of the year before. He had forgotten the lesson of all good dogs, obedience, and he was out for a frolic.

Last fall I again took him into the country as an experiment. I wanted to explode the idea, if I could, that a dog once spoiled was afterward forever worthless. I knew I had good material to work on. I took my pupil back to first principles, and taught him to charge when I gave the word under any and all circumstances. I then took him into the field and made him drop when any bird rose so near that I judged he saw it rise. When he dropped to wing nicely I started him in on birds, keeping him close. When he showed he had the faintest trace of birds I made him stop, and held him there for a few minutes to impress upon him that he was hunting for me, and then I would walk up with him until the birds were flushed, dropping him invariably to wing. Two weeks of this work without the gun and he was as steady as a clock. When I turned him over to his owner he was as hard as a nut and as staunch as an oak. He would instantly turn to the whistle an eighth of a mile away; in fact, he was a good dog again, and like good Indians, good dogs are very infrequent.

To the sportsman who loves a good dog but only has the time to use one a few days in the year, I say secure a pointer; they are slower and steadier than setters and will stand the chain, and yet do fair hunting. To such a man setters are of no earthly account. They may be perfect when purchased, but one year upon the chain will ruin them. When taken into the field for the first few hours they will chase the wind and such birds as they may flush in their mad race and then become exhausted, and their hunting fever gone. A setter needs lots of work and constant experience in the field to keep them steady. When hard worked and handled by an experienced sportsman, they are far superior to pointers in endurance, style, and speed, and it is the very qualities which makes them so valuable when properly handled that makes them worthless when out of form. HUNT.

ST. PAUL, MINN.

["Experience with dogs" is just what we want to hear about, and we hope that those who have read "Hunt's" instructive communication, and have anything of their own to offer on this topic will favor us with it. Experience need not have been successful to make its relation useful. The mistakes made in dog training may be quite as instructive as the more successful efforts. Whoever has had an experience with dogs, which may be of service as a guide or warning to other amateur trainers, may benefit his fellow men by relating it.]

THE ROYAL SPORT OF COURSING.

A GREYHOUND, as he appears in the crowded streets of a city, is by no means, to the average observer, a thing of beauty or grace. There is a lack of animation in his eyes; his drooping ears impart to his long, slender head an inane expression; while his canter, or lope, conveys to one who has never seen him in the field the idea that his speed is legendary or mythical. In fact, his whole make up and appearance, as he perhaps quietly trots along the paved street, with head on a line with his body and ears folded close, is extremely disappointing to one who has heard of, but never has seen, his animated appearance when in quest of "puss." Come with me, my disgusted friend; let us see this stupid creature in another light.

Picture, if possible, that same slender greyhound, with head tossed high, delicate ears erected, muscles and cords distended, eyes flashing fire, and you will then appreciate the wonderful beauty, grace and strength of the greyhound in the field. When I first saw the sight, I at once likened his expression to that of a noble eagle or hawk on the lookout for prey.

If the reader be a sportsman, a single day with greyhounds, in a country where large California hare are to be found, will fill him with enthusiasm and love for the beautiful, remorseless flyers.

I hardly know a sport that so quickly entrances a susceptible person as does the exciting sport of coursing. No wonder that in ages past it was, with falconry, the chosen sport of kings and princes and ladies of high degree.

Suppose we follow an old custom of mine years agone in California, and two or three of us spend a few hours upon the plains with our six or seven dogs. By the way, let me state that the California hare differs from the jack rabbits of Texas and countries east of the Sierra Nevadas, the California hare being both larger and faster.

Well, we make our arrangements for to-morrow's "battle royal," and, having fed our hounds, turn in early to bed, for legs will be weary indeed ere this time twenty-four hours. In the morning you can do as you prefer, eat a hearty breakfast or not; as for myself, a cracker or two is enough, for I found by experience some time since that I could walk further and better and with less fatigue by not overloading beforehand. At length we are off, with the greyhounds running around us. A brisk walk of a mile or two along the level California roads brings us to some fields or country where puss is to be found, so we separate some fifty paces apart, and walk ahead, with eyes on the lookout for the first start. Our dogs are all fine fellows—well experienced; see them as they, with eager, cruel eyes, impatiently await the sight of their devoted prey. We have taken but a few steps when we simultaneously whoop with excitement, for up jumps a brown, long-eared creature that leaps away with bewildering speed. Look! the black and the blue dogs have seen it; the others, jumping at our cries, also catch the sight and away they go—the hare with a start of full one hundred and fifty yards. Ah, that's the sight you never had before! Look at the race between the black and the blue. How they pound the earth with their flying feet! Ha! ha! see the brindle come up with the leaders; and the others are also putting in some fast work. The chase is now a mile away, perhaps further, when we shout with glee as we see the black dog crowding puss so hard that she suddenly darts off at a right angle to her previous course, and we give the credit for the first "turn" to the noble black, whose momentum carries him fifty feet beyond the sharp corner made by puss. Now the blue takes up the work. Another turn, and the brindle does his share; and whoop! old black again is leading. Poor puss, your time is short; those cruel hounds keep coming, coming, coming; you turn and turn again, and now, perhaps, have doubled back, and are not forty rods from us. The eager hounds are crowding the quarry hard; the turns are quicker and quicker, one after an-

other—a mix of dogs and hare, and hare and dogs, when, see! the white hound darts in, after the latest double, sinks its fangs into exhausted puss, and the course is finished.

Calling off the dogs, we reckon up the amount of work each one has done; the greater number of points proves to be in favor of the old black. It is no new thing to give him credit for a well-run course.

And now, my friend, who "always wondered what there was in greyhounds to admire," what think you? One look at your excited, glowing face is enough. Henceforth you are a devotee to the kingly sport of coursing.

Again, after a few moments' rest, we push ahead. Again we yell as puss jumps up and scurries off. Again the hounds catch sight of their prey, and on wings of the wind fly after. Ditches and sloughs, if in the course, are gaily taken with amazing ease. Some of the dogs perhaps will not leap the fences, but crawl through them where the others sail over. At each leap of the "fencers" in their mad course our voices ring out with exultant approbation. "Well done, Spring!" "Good boy, Poor Pat, that was a corking jump," as the latter clears a five-foot fence with no apparent exertion. Soon the chase is lost to sight, hidden, perhaps, by intervening brush or rolling ground. We wait a while, then walk in the direction taken by our dogs. Anon we see them coming slowly back, and when they reach us an examination shows a few hairs clinging to the corners of their mouths; these tell the fate of puss. But one of the hounds, Poor Pat, is missing. Look! half a mile away comes the game old boy, carrying in his mouth the heavy hare, killed perhaps a mile and a half further on. We never saw his equal for "packing in" his hare; and when the old hero reaches us and is relieved of his heavy burden, we caress him lovingly. "Good boy, Pat, the old countryman of yours who gave you to us shall have this hare upon his board to-night."

And so it goes; perhaps the next hare we start takes to the earth after a sharp run; and although we could easily reach to lift her out, we do not. She has earned her life this time; let her have it.

After two or three more runs we look at our watches, which tell us 3 P. M. Our appetites corroborate the watches, so we turn homeward, carrying five or six hares, the results of our sport. These we leave with certain Hibernian and English friends, who like the flesh, which we do not. Upon reaching home, having fed our footsore, tired hounds, we eat our "breakfast" with keenest relish, meanwhile recounting the various exciting incidents of the day. And we enjoy a quiet laugh or two at our enthusiastic convert, who extravagantly plans for future sport, and who, I fear, will fall a ready victim to the wily dog seller for some time to come. He also now decries the man who "murderously" shoots poor puss, forgetting that less than a day ago to him a hare was but a hare, and if any one preferred shooting it to coursing it, why, what difference?

Such quiet modes of coursing I personally prefer to regular meetings, in which the cracks are matched against one another, and are loosed from the slips, to insure an even start. Not but that such matches are intensely exciting, for indeed they are; in fact, therein lies my objection to them, for, no matter how correctly a judge renders his decision in a closely contested course, dissatisfaction at the defeat of a beloved dog is very apt to arise. The position of judge in a coursing match is as truly a thankless one as it is in a bench show or field trial. So, all in all, give me the "battle royal," or, for a change, a bit of quiet sport among a few friends where the dogs are slipped in couples, no prizes nor money being dependent upon the results.

Greyhounds are wonderful leapers. Were it not that I fear being discredited, I would state the distance leaped by Mr. Wright's Quicksilver, at Modesto, in 1872 or '73. Should this meet the eye of some Californian, who remembers that marvelous jump, will he not state the distance in FOREST AND STREAM? I refer to the time when the hare swam a slough, and Quicksilver, who, by the way, was a grandson of the English winner, Master McGrath, coming up with a grand rush, cleared the slough, to the amazement of the spectators. He was a noble greyhound.

I love the graceful, quiet creatures. Often have I sat reading for hours at a time, with three or four of the silken-coated blue bloods standing or sitting around me, their slender heads lying on my knees or in my lap, while their great lustrous eyes looked calmly into mine. They would remain there like statues until I moved.

And how game they are! I think it is Charles Lever who records it as a fact that two greyhounds were slipped after a hare, and the three went out of sight. They did not return, and the next day, some twenty miles away, the hare was found, dead, twenty yards ahead of the lifeless body of one hound, while the other hound lay dead, fifty yards in the rear. All three had run to the death.

I am sorry for sportsmen who have never enjoyed the excitement of coursing. You cannot appreciate the glorious sport as yet unknown to you. The only trouble is that it is apt to prove too fascinating, too exciting. Great is the man who, being an owner of greyhounds, can attend the meet, wherein they contest, without losing his self-possession and good nature. I have seen two such men. Some time since I read that several Eastern gentlemen would introduce coursing into the Atlantic States. I trust they will succeed in their attempt. While the country is not so well adapted to the sport as California (where the chase can be seen on the level plains for miles), still, once started in the East, its future there would be assured.

I should like to visit the Pacific slope next month and do a bit of coursing on the old grounds. And to find that same nervous horse, who oft enjoyed the sport as much as his rider, to carry me through a glorious "battle royal." Imagine, if you can, the thrilling contests between the flying hounds, witnessed from the back of a noble horse, and you will agree with me that coursing is royal sport indeed. DELTA.

DETROIT, Mich.

COCKER SPANIEL PRODUCE STAKES.

Editor Forest and Stream:

The progeny of the following bitches have been entered for the American Cocker Spaniel Club Produce Stakes to be decided at Westminster Kennel Club show, New York, May 5, 6, 7 and 8, 1884:

Toronto Jet (Nigger—Belle), J. F. Kirk, Toronto, Can.

Queen Vic (Witch—Madge), J. S. Cattanach, V. S., New York.

Princess Royal (Dandy—Queen Vic), J. S. Cattanach, V. S., New York.

Hornell Dinah (Prince—Sister to Beau), Hornell Spaniel Club, Hornellsville, N. Y.

Hornell Ruby (Bob III.—Lady Bath), Hornell Spaniel Club, Hornellsville, N. Y.

Hornell Baroness (Baron—Queen), Hornell Spaniel Club, Hornellsville, N. Y.

Blackie (Rolf—Belle), F. F. Pitcher, Claremont, N. H.

Gracie (Snip—Juliette), F. F. Pitcher, Claremont, N. H.

Topsy (Drake—Victoria), Hornell Spaniel Club, Hornellsville, N. Y.

Prin (Witch—Princess), Hornell Spaniel Club, Hornellsville, N. Y.

Nellie (formerly Lawson's), Dr. J. S. Niven, London, Ont.

Dolly (Jack—Bobtail), Dr. J. S. Niven, London, Ont.

Luna (Jack—Jessie), Geo. Schofield, Toronto, Can.

Bonny Kate (Don—Lady), J. F. Kirk, Toronto, Can.

Hornell Ruby (Bob III.—Lady Bath), Hornell Spaniel Club, Hornellsville, N. Y. J. F. KIRK,

Hon. Sec, American Cocker Spaniel Club.

TORONTO, Feb. 6, 1884.

CRYSTAL PALACE DOG SHOW.

[From our Regular Correspondent.]

THE Kennel Club's twenty-second exhibition of sporting and other dogs was held in the gallery of the Crystal Palace on the 15th, 16th, 17th and 18th of January, the total entries amounting to 1,507, 29 of which were double entries and 353 puppies. But in acknowledging the Kennel Club exhibition of January, 1884, as the most successful and grandest exhibition ever held, it ought to be remembered that it really represented a number of special clubs; such as the Mastiff, St. Bernard, Great Dane, Collie, Dachshund, Bulldog, Fox-terrier, Bedlington, Dandie Dinmont, Irish Terrier, and other clubs, who offered numerous valuable prizes for private competition among their members. The benching and feeding of the exhibits, as usual, was intrusted to Spratt's Patent, which, under the able management of Mr. Charles Croft, was a guarantee that all possible care was taken of them.

In bloodhounds Nestor had an easy win in the champion class; in the open dog class, Mr. Nichols's Triumph, who was placed first, is a young dog, rather dark in color, but sure to improve in that respect as he gets older. Otherwise he is about the grandest young dog we ever saw; he is very good in ear. The second prize winner, Maltravers, also bred by Mr. Nichols, is another good specimen. The bitches were a very good class and the winners well placed.

In mastiffs, Crown Prince came once more to the front in the champion class, the brindled Cardinal not being entered for competition. In champion bitches, Rosalind won quite easy. She is a grand bitch, but would be improved with having more wrinkle. In the open dog class, Orlando, who won first, is a remarkably massive-made dog of good type; nevertheless, he is so much out at elbows and low at shoulder, that we think he was very lucky to win. Boatswain, who won second, is another good-headed dog, but is not straight on his legs. Prince, who was placed third, has much better legs and feet than those placed over him, and has a really good head. Moses, who won fourth, is a fairly good young dog, but seems a nasty-tempered animal. The bitches were the best class we have ever seen, first and second being really grand animals; the third was also good. Bal Gal, vhc. reserve, we consider very fortunate, as there were several much better behind her. The dog puppies were only moderate. The bitch puppies were a good class, the three best being full sisters, and we considered the winner rather the worst of the three, being large of ear and smaller of skull.

There were four entries in the St. Bernard champion class, one, Save, not for competion. Pedro was absent, so the fight was between Bayard and Cadwallader, the former taking the honors this time, though not quite up to his best form. In the bitch class, Madam had an easy win over Amy, the only other entry. In the open dog class thirty-one faced the judge, and it was one of the best classes we have seen. Leonard won first. He is improved since we saw him last. He was closely followed by S. W. Smith's new dog, Duke of Leeds, who has a grand skull, good, straight coat, and is a beautiful color, with white markings. Third went to Glacier, a good, big dog, with a fair head. He has a rich orange color, with nice black face markings. He is rather proud of his tail. Next came Boniface for fourth, but we prefer the vhc. Faust. Sailor, a dog we always liked, was rightly placed reserve number. Sultan III. is a very large dog. He is too sharp in muzzle and small in skull. Storm King is too small. Courage II. is plain in face. The bitches were a good class of twenty-three, including several of the best on the bench. Elfreda followed up her Bristol form by taking first, Cloister, in nice condition, coming second. Third went to a fair bitch named Bernardine. She is light of bone, but is nicely marked. Bertha came in fourth, but had Theis been better shown she would have beaten Bertha.

It was a walk-over for Beauchief in the smooth dog class. Don II. is light in bone for so large a dog, although he has a good head and ears, and deserved the second. Bera, late Copenhagen, is now showing age. In the bitch class, Leila, the Hundred Guinea Cup winner at the St. Bernard Club show, had it all her own way for first, second going to Chinaleta. Ida II., looking her best, came in for reserve. There were several very good young ones in the puppy classes. In smooth-coated puppies, Mr. Thornton won with a most promising youngster.

The black Newfoundlands, as usual, were small classes, Nelson I. winning in the champion class. Gunville, first in dogs, is a very good specimen. The bitches were, as a rule, small in size, and the winner was out of coat. Newfoundlands other than black were well represented, and the decisions seemed to give general satisfaction.

Great Danes came out in good force, and the quality was better than we have ever seen in England before.

In deerhounds Chieftain won in the champion class. We consider his light color his worst fault. First and second in the open dog class were good specimens, one of which changed hands, we understand.

The greyhound classes were small, but the quality was very good, Messrs. H. P. and J. P. Charles winning all before them. We fancied the black and white Bonnie Lass to be the winner in the bitch class.

In pointers Mr. Norrish once more won in the champion class with his liver and white Graphic. In large-sized dogs the winner is rather fat and appears throaty. The second prize, Duke IV., is a little faulty in muzzle and refused to show well in the ring. The large-sized bitches were a good class, and any of those noticed are fit to win, and the same remarks apply to the small-sized dogs and bitches.

In the English setter champion class there were no entries for competition. In the open class first went to a lemon and white dog, Sting, who was first at Bristol two weeks ago, he has a good head and good coat. Tycoon, the second prize, is a blue belton, rather shorter in head than the winner, but a very good dog. First in bitches went to Wild Rose, rather out of coat, with more bone than the second prize, Pearl, who is a very nice bitch with a good shaped head. Flimsy, the third prize, is a strong, well-made bitch but not possessing the qualities of the winner. In puppies, Ramble, a liver ticked dog, was placed equal first with Mr. Cockerton's Bella, of Ravensbarrow, a blue belton. Mr. Lowe being vhc. with a very nice young dog, Blue Rocket.

In black and tan setters, Dan II. won first, being closely pressed by Heather Ranger, who was very good in tan, but being only ten months old, was not so well furnished as the winner. Wild Grouse, hc., is a very good coated dog, rather deficient in color. Norwich Bloom, first in bitches, was in good form and an easy winner over Alice, who is not so good in feet. Kate XI. was a very fair specimen. Kate IV. rather out of coat. The winning puppy, Heather Gem, was rather more forward than the second prize, Fan VII.

In the Irish setter champion class Geraldine won first, beating Nellie, who is a trifle fine in muzzle. Roy, first in open dog class, is a handsome little dog rather fine of muzzle and out of condition at present. Tyrone is a very good dog but is a little strong in head. King Billie is another good one and the vhc., Chief, is another typical dog but small. The bitches were a very good class. We thought Lady Palmerston II. ought to have been further up.

In sheep dogs Rutland, who was first in the champion class, is a very handsome black and tan; he was looking better than we ever saw him before. Peggy, winning first in the bitch class, was closely pressed by Lorna Doon. The open class for rough sheep dogs was a very large one and contained a great many very fine specimens. First went to Young Cockie, a very good black and white, who seemed to carry his tail rather high. Tramp II. was looking very well. Romulus, who won third, is a sable; he is rather short of coat and frill and large of ear. We fancied the sable dog Highland Chief equally as good as any in the class; Loafer, vhc., is another nice dark sable dog. The fourth prize went to a coarse black and white. In bitches first went to a very fine dark sable bitch a little short of frill. The puppy classes contained some very promising young ones. In the bitch puppies we fancied the third prize one very much, being more heavily coated than the winner, with a smaller ear. She was quickly claimed at £50.

The basset hounds were a very good collection, Mr. C. R. Krehl having a very large entry and winning most of the prizes.

In Dalmatians, the winner, Treasure, was a long way ahead of the rest.

In Pomeranians the first is a very handsome little black. The second is Mr. Fawdry's well-known white dog Charlie.

In poodles the prizes all went to well-known winners.

Monarch, who won in the champion bulldog class, also won the challenge cup, Britomartis scoring the same in the bitch class. In the open class for dogs over 60lbs. and bitches over 50lbs., first went to President Garfield, a brindle, with a very good skull. In the next class, first went to Black Prince, a dark brindle, with a good skull. He is a trifle long in back. In the corresponding bitch class, first went to a very showy red and white bitch, with a small nose and round skull. The winners in the other classes were fair specimens, but nothing above the average.

Irish water spaniels were a failure; only two were in the show—Lady and Young Hilda—the former winning, being best in coat, but in every other respect we prefer the latter.

In the Clumber spaniel champion class John o' Gaunt won easily, his kennel companion, Tower, winning in the open class.

The Sussex spaniels were a small class.

In champion field spaniels, first went to Solus, who was looking his best and was really a show of himself. There was nothing against him but Miss Oho. We consider her a much overrated cocker, being too flat in skull to suit our ideas. Roysterer is a very good, long, low and well-bodied dog, just a little plain in head. We think the second and third prize dogs ought to have exchanged places. In cocker bitches, the first prize, Little Smutty, is a very handsome little cocker and of the correct type, but would be improved if a little stronger before the eyes.

In fox-terriers, Spice won in champion dogs and Bedlamite in the bitch class. We thought Diana ought to have won, but at present she is rather out of condition, and being a small bitch she looked more of a toy than usual. In the open dog class, first went to a lemon marked dog, not as good in his quarters as he might be. The second is rather large in ear and coarse in head. He was claimed at £50. In bitches, the first is rather light in bone. The second is a very good one, she has a good head, good feet and legs, with plenty of terrier expression.

There was only one entry in champion bull-terriers. In large sized bull-terriers the competition was good, and the awards were pretty generally indorsed. In small sized bull-terriers there were very few good specimens, we might say very few moderately good specimens.

The Airedale terriers were a fairly good class, and Bedlingtons were also good. Many of the hc. and c. dogs are fit to win at any ordinary show.

Irish terriers were very good in quality, with a very fair entry of thirty-six.

Champion pugs had only one entry in the dog and two in the bitch class, Jenny having an easy win from Buttercup. The first in the open class for dogs is of good size and style, but is very smutty in color. The second and third are better in color but rather larger.

In Yorkshires, Bradford Hero scored another win for Mr. Foster.

Lady Gifford had the whole maltese class to herself, and certainly her exhibits are really worth going a good distance to see.

The Blenheim spaniels seemed more numerous than we have seen them for some time, and the quality throughout was very fair.

In King Charles, the first prize dog, Bend-Or, is the best we have seen for a long while, we think he will make a better dog than his companion, Alexander the Great.

Italian greyhounds and toy terriers were as usual, good but nothing to call for special comment. Following is a list of the

AWARDS.

BLOODHOUNDS.—CHAMPIONS: Prize, M. Beaufoy (Nestor).—OPEN—*Dogs:* 1st, E. Nichols (Triumph); 2d, L. G. Morrell (Maltravers); 3d, E. R. Ray (Nobleman) *Bitches:* 1st, L. G. Morrell (Malvina); 2d and 3d, E. Nichols (Patti and Phryne).

MASTIFFS.—CHAMPIONS—*Dogs:* Prize and cup, Dr L. Forbes-Winslow (Crown Prince). *Bitches:* Prize and cup, Dr. L. Forbes-Winslow (Rosalind).—OPEN—*Dogs:* 1st, J. S. Turner (Orlando); 2d, M. Beaufoy (Boatswain); 3d, J. Royle (The Prince); 4th, J. Evans (Moses). *Bitches:* 1st, H. G. Woolmore (Cambrian Princess); 2d, H. Oldham (The Lady Ella); 3d, F. J. Campell (Lily II.).—PUPPIES—*Dogs:* 1st, R. Cook (Ilford Caution); 2d, G. Renton (Guelph II.). *Bitches:* 1st, J. S. Turner (Guinevere); 2d, J. Evans (Vivian).

ST. BERNARDS.—CHAMPIONS—*Dogs:* 1st, J. C. Macdona (Bayard). *Bitches:* Prize, H. I. Betterton (champion Madam).—OPEN, ROUGH-COATED—*Dogs:* 1st and cup, J. F. Smith (Leonard); 2d, S. W. Smith (Duke of Leeds. late Good Bayard); 3d, E. Hodgson (Glacier); 4th, J. C. Macdona (Boniface). *Bitches:* 1st, H. C. Joplin (Elfrida); 2d, W. G. Marshall (Cloister); 3d, G. S. Ball (Bernardine); 4th, W. Wells (Bertha).—SMOOTH-COATED—*Dogs:* 1st, W. Wells (Beauchief); 2d, J. C. Davies Don II.). *Bitches:* 1st and cup, R. Thornton (Leila); 2d, H. C. Joplin (Chinalette).—ROUGH PUPPIES—*Dogs:* 1st, R. Thornton (Amelot); 2d, H. I. Betterton (Correze); 3d, J. H. Ellis (Valentine). *Bitches:* 1st, H. G. Sweet (Romola); 2d, Rev. W. S. Barthropp (Meta); 3d, E. Snelling (Rhona).—SMOOTH—*Puppies:* Prize, R. Thornton (Evio).

NEWFOUNDLANDS.—CHAMPIONS: Prize and cup, E. Nichols (champion Nelson I.). BLACK—*Dogs:* Prize, H. R. Farquharson (Gunville and Courtier). *Bitches:* 1st, E. Nichols (Sybil); 2d, A. C. McMinn (Dagmar).—OTHER THAN BLACK—1st and 2d, H. R. Farquharson (Trojan and Seaman).

BOARHOUNDS.—CHAMPIONS: Prize, C. Petrzywalski (Sultan II.). OPEN—*Dogs:* 1st, R. Bryan (Samson); 2d, Mrs. M. Hazlerigg (Prince Charlie); 3d, S. E. Shirley (Thunder). *Bitches:* 1st and extra cup, C. Petrzywalski (Mirza); 2d, S. E. Shirley (Nox); 3d, J. Angell (Diana). *Puppies:* 1st, G. Bolton (Luther); 2d, A. A. Grosvenor (Mark Antony); 3d, A. Moore (Athlete).

DEERHOUNDS.—CHAMPIONS: Prize, H. C. Joplin (champion Chieftain). OPEN—*Dogs:* 1st, G. W. Hickman (Lord of the Isles); 2d, Miss E. de la Pole (Glengariff); 3d, Misses A. Maxwell and E. Cassel (Victor) *Bitches:* 1st, Miss de la Pole (Belle); 2d, A. Maxwell and E. Casse (Minna); 3d, G. W. Share (Storna).

GREYHOUNDS.—*Dogs:* 1st and 2d, H. P. and P. J. Charles (champion Mennon and Whiskedale II.); 3d, H. C. Hodson (Emperor). *Bitches:* Prize, G. S. Ball (Lancashire Witch).

POINTERS.—CHAMPIONS: Prize, E. C. Norrish (champion Graphic).—OPEN—55LBS. AND UPWARD—*Dogs:* 1st, G. Pilkington (Lake); 2d, F. A. Manning (Duke IV.); 3d, B. Field (Young Dick).—50LBS. AND UPWARD—*Bitches:* 1st, S. Price (Bell of Bow); 2d, C. H. Beck (Nan); 3d, W. Arkwright (Lady Olive).—UNDER 55LBS.—*Dogs:* 1st, Sir T. B. Lennard, Bart. (Belhus Hector); 2d, Prince Albert Solms (Naso Kipping); 3d, H. Burra (Duke of Glenmarkie).—UNDER 50LBS.—*Bitches:* 1st, S. Price (Mealy); 2d, R. J. L. Price (Bellona); 3d, J. L. Bulled (Bell of the Ball).—SINGLE ENTRIES, NOT LITTERS—*Puppies:* 1st, E. Palmer (Devon Duke); 2d, J. Whitley (Sir Garnet).

ENGLISH SETTERS.—*Dogs:* 1st and 2d, H. Platt (Sting and Tycoon); 3d, Mr. H. F. Grant (Junior Carlton). *Bitches:* 1st, H. Platt (Wild Rose); 2d, B. Field (Pearl); 3d, J. H. Platt (Flimsy). *Puppies:* Equal 1st and 2d, Major H. Platt (Ramble) and J. B. Cockerton (Bella of Ravensbarrow).—BLACK AND TAN.—*Dogs:* 1st, J. Williams (Dan II.); 2d, R. Chapman (Heather Ranger); 3d, C. T. Fauntleroy (Dasher). *Bitches:* 1st, W. Long (Norwich Bloom); 2d and 3d, F. A. Manning (Alice and Juno V.). *Puppies:* 1st, R. Chapman (Heather Jem); 2d, W. Eglinton (Fan VII.).

IRISH SETTERS.—CHAMPIONS: Prize, Rev. R. O'Callaghan (champion Geraldine).—OPEN—*Dogs:* 1st, B. R. Woodd (Roy); 2d, Rev. R. O'Callaghan (Tyrone); 3d, E. F. Welch (King Billy). *Bitches:* 1st, E. F. Nuttall (Leo VII.); 2d, L. F. Perrin (Wee Kate); 3d, Rev. R.

THE WESTMINSTER KENNEL CLUB'S ORANGE AND WHITE POINTER DOG "BANG BANG."

O'Callaghan (Vintry). *Puppies:* 1st, Rev. R. O'Callaghan (Iona); d, H. F. Smith (Lanwath Pat).

RETRIEVERS.—WAVY: Prize, S. E. Shirley (Moonstone).—CURLY-COATED: Equal 1st, G. Culley (Jet II.) and the Duke of Hamilton (champion Baron).—OPEN, WAVY—*Dogs:* 1st, S. E. Shirley (Tractor); 2d, Col. H. Ewart (Wing); 3d, G. Foster (Foppery). *Bitches:* 1st, S. E. Shirley (Tacit); equal 2d, S. E. Shirley (Tact) and Lieut.-Col. H. C. Legh (Breeze). *Puppies:* 1st, S. E. Shirley (Tacit); 2d, Lieut.-Col. H. C. Legh (Bob II.)—CURLY COATED—*Dogs:* 1st, R. Chapman (King of the Koffees); 2d, G. Culley (Crown Prince); 3d, H. Lingwood (Sammy). *Bitches:* 1st, Duke of Hamilton (Lady Neil); 2d, Dr. W. A. G. James (Luna), 3d; Mr. C. Taylor (Miss Gyp).—OTHER THAN BLACK: 1st, H. Skipworth (Venture); 2d, R. Chapman (Mistake).

SHEEPDOGS.—CHAMPIONS, ROUGH-COATED—*Dogs:* 1st, S. Boddington (Rutland); 2d, M. C. Ashwin (Donald). *Bitches:* Prize, Rev. H. F. Hamilton (Peggie II.)—CHAMPION, SMOOTH-COATED: Prize, D. P. Thomas (Beryl).—OPEN—*Dogs:* 1st, J. J. Steward (Young Cockie); 2d, R. Chapman (Tramp II.); 3d, J. Osborne (Romulus); 4th, Dr. G. C. Edwardes Ker (Augustus Cray). *Bitches:* 1st, W. Buckley (Morwyn); 2d, J. J. Stewart (Patience); 3d, Rev. H. F. Hamilton (Sooty); 4th, D. P. Thomas (Welsh Lass). SMOOTH COATED: 1st, W. A. G. James (Lady Help); 2d, M. C. Ashwin (Lady Elcho); 3d, A. Hastie (Dark Jennie).—PUPPIES—*Dogs:* 1st, J. J. Stewart (Young Cockie); 2d, T. Easton (Red Gauntlet); 3d, W. A. G. James (Clover). *Bitches:* 1st, E. Collings (Amy Robsart); 2d, S. Boddington (Miss Charlemagne); 3d, J. Beach (Myra III.).—BOB TAILS: 1st, D. P. Thomas (Sir Guy); 2d, R. J. Lloyd Price (Belle of Ranelagh).—COLLIE CLUB DERBY: 1st, J. J. Steward (Young Cockie); 2d, Dr. W. A. G. James (Clover); 3d, H. Ralph (The Bedouin).

BASSET HOUNDS.—CHAMPIONS.—Prize, G. R. Krehl (Jupiter).—OPEN—*Dogs:* 1st, G. R. Krehl (Fino); 2d, R. Temperley (Roufiot). *Puppies:* 1st, H. V. Gibson-Craig (Carillon); 2d, G. R. Krehl (Oriflamme).

BULLDOGS.—CHAMPIONS—*Dogs:* Prize and challenge cup, H. Layton (Monarch). *Bitches:* Prize and challenge cup, A. Benjamin champion Britomartis).—OVER 60LBS., *Dogs:* OVER 50LBS., *Bitches:* 1st, J. W. Gurney (President Garfield); 2d, A. T. Foreman (Big Ben).—OVER 45LBS. AND NOT EXCEEDING 60LBS.—*Dogs:* 1st, C. R. C. King (The Black Prince); 2d, S. E. Shirley (Cervantes); 3d, J. W. Gurney (Royal George).—OVER 35LB. AND NOT EXCEEDING 50LBS.—*Bitches:* 1st, J. W. Gurney (Wheel of Fortune); 2d, J. S. P. Sellon (Dona Sol); 3d, T. A. Skeate (Chandos Demon).—NOT EXCEEDING 45LBS.—*Dogs:* 1st, W. Donkin (Castor); 2d, A. K. Smith (Bacchus II.); 3d, A. Benjamin (Kimmel Billy).—NOT EXCEEDING 35LBS.—*Bitches:* 1st, A. J. L. Price (Empress V.); 2d, H. Layton (Jenny Howlett II.); 3d, J. S. P. Sellon (Belladonna). *Puppies:* Prize, A. Benjamin (Kimmel Billy).

IRISH WATER SPANIELS.—*Dogs:* Prize withheld. *Bitches:* 1st, G. S. Hockey (Lady).

SPANIELS.—CLUMBERS—CHAMPIONS: Prize, H. H. Holmes (champion John o' Gaunt).—OPEN—*Dogs:* 1st, H. H. Holmes (Tower); 2d, G. B. Clark (Ramble); 3d, E. Malling (Duke O.). *Bitches:* 1st, E. Bishop (Foxley Beauty); 2d, R. W. S. Lowndes, Jr. (Lulu).—SUSSEX AND LIVER-COLORED, OVER 25LBS.—*Dogs:* 1st and 2d, Hooley Brothers (Horatio and Baryta). *Bitches:* 1st, J. Partridge (Brida II.); 2d, J. R. Whittle (Voisine).

FIELD SPANIELS.—CHAMPIONS: Prize, J. Royle (Solus).—BLACK, OVER 25LBS.—*Dogs:* 1st, H. B. Spurgin (Roysterer); 2d, W. Riddlesdell (Bramble); 3d, A. H. Easten (Easten's Bracken). *Bitches:* 1st, J. Royle (Salus II.); 2d, J. C. Phillips (Beatrice); 3d, A. Easten (Easten's Busy).—COCKERS, ANY COLOR, NOT EXCEEDING 25LBS.—*Dogs:* Prize, G. W. Carter (Jingo). *Bitches:* 1st, A. H. Hussey (Little Smutty); 2d, A. F. Nash (Lilac).—OTHER THAN LIVER OR BLACK, EXCEEDING 25LBS.—*Dogs:* 1st, H. B. Spurgin (Counsellor); 2d, A. H. Easten (Easten's Bruce). *Bitches:* 1st, H. B. Spurgin (Fanciful); 2d, J. Royle (Zuess).

FOX-TERRIERS.—SMOOTH HAIRED.—CHAMPION—*Dogs:* 1st, L. Turner (Spice; 2d and 3d, Rev. C. T. Fisher (Richmond Jack and Darkie). *Bitches:* 1st, Rev. C. T. Fisher (Bediamite, late Joyous); 2d, L. & W. Rutherfurd (Diana); 3d, F. Redmond (Diadem).—OPEN—*Dogs:* 1st, Rev. C. T. Fisher (The Belgravian); 2d, J. J. Pim (Brokenhurst Jim) 3d. A. R. Wood (Splinter); 4th, F. Redmond (Dandy Dick, late Silver Dick); 5th, A. and C. Fraser (Rookwood). *Bitches:* 1st, J. J. Pim (Just); 2d, Hill and Ashton (Meersbrook Model); 3d, R. H. Barlow (Nadine); 4th. C. E. Longmore (Dulcie); 5th, A. and C. Fraser (Joyful).—PUPPIES—*Dogs:* 1st, A. Hargreaves (Hogmaston Rebel); 2d, Hill and Ashton (Meersbrook Ross); 3d, A. E. Knight (Citron). *Bitches:* 1st, Hill and Ashton (Meersbrook Model); 2d, H. S. Whipp (Douglas Nettie); 3d, T. Errington (Eaton Trip).—WIRE-HAIRED—CHAMPION—*Dogs:* 1st and 2d, Earl of Lonsdale (Briggs and Sam Weller). *Bitches:* 1st and 2d, Earl of Lonsdale (Miss Miggs and Vora). OPEN—*Dogs:* 1st and 2d, W. Carrick, jun. (Master Tiger and Turk II.); 3d, H. G. Bennett (Derwent); 4th, M. Hazlerigg (Trophy). *Bitches:* 1st, W. Carrick, jun. (Carlisle Venom); 2d, W. W. Beckh (Black Watch); 3d, M. Hazlerigg (Tinder); 4th, Earl of Lonsdale (Grace Broom). —PUPPIES—*Dogs:* 1st, A. Maxwell and E. Cassel (Jack Frost); 2d, W. Carrick, jun. (Tinder); 3d, R. Bird (St. Swithin). *Bitches:* 1st, W. Carrick, jun. (Lill Foiler); equal 2d, P. C. Reid and W. Carrick, jun. (Ely Pickle and Carlisle Venom).

DACHSHUNDE.—CHAMPIONS—*Dogs:* Prize, W. E. Litt (Olympian). *Bitches:* Prize, W. A. Benson (Rosa). OPEN CLASS—*Dogs:* Equal 1st, M. Woolten (Zeyn) and W. J. Lake (Faust II.); 2d and 3d, Mrs. P. Merrik-Hoare (Carlowitz and Drachen). *Bitches:* 1st, G. R. As kwith (Shotover); 2d, E. W. Hazlewood (Swipes); 3d, J. Knight Bruce (Lady). PUPPIES—*Dogs:* 1st, L. Daniell (Redman); 2d, Mrs. P. Merrik-Hoare (Drachen); 3d, A. W. Byron (Roller). *Bitches:* 1st and 2d, E. M. Southwell (Schone and Schenke); 3d, J. S. Pearson (Zibeline). PRODUCE STAKES.—1st and 2d, E. M. Southwell (Schone ane Schenke); 3d, Mrs. P. Merrik-Hoare (Drachen); 4th, T. S. Daniel (Redman).

BULL-TERRIERS.—CHAMPIONS: Prize, Alfred George (Mistress of the Robes).—OPEN CLASS—OVER 25LBS.—*Dogs:* 1st, J. R. Pratt (Baron); 2d, T. H. Hewitt (Murder II.); 3d, Alfred George (Bendigo). *Bitches:* 1st and 2d, Alfred George (Vendetta and Luci); 3d, John Richardson (Maggie May II.) NOT OVER 25LBS.—*Dogs and Bitches:* 1st, Alfred J. Hudson (Guess); 2d, Robert Beulley (Young Joe); 3d, Arthur Henry Taylor (John Bull).

AIREDALE TERRIERS.—*Dogs and Bitches:* 1st, Thomas Carr (Kisghley Crack); 2d and 3d, Edward Constantine (Toss and Jock).

BEDLINGTON TERRIERS.—CHAMPIONS—Prize, J. S. Watson (Senator).—OPEN CLASS—BLUE OR BLUE AND TAN—*Dogs:* 1st and 3d, John A. Batz (The Bishop and Lord Stowel); 2d, A. N. Dodds (Hairdresser). *Bitches:* 1st, H. Burnett Watson (Topsy); 2d, John A. Batz (Durham Lass); 3d, John Sherwood, Jr. (Blue Stocking). ANY OTHER COLOR—*Dogs and Bitches:* 1st, H. Burnett Watson (Choker); 2d, John A. Batz (Pincher). *Puppies:* 1st, Andrew N. Dodds (Mark Tapley); 2d, J. Dawson (Randolph); H. Burnett Watson (Crocodile).

IRISH TERRIERS.—CHAMPIONS—Prize and medal, Charles M. Nicholson (Poppy).—OPEN CLASS—*Dogs;* 1st, William Graham (Garryford); 2d, and 1st club, R. B. & T. S. Carey (Mogue); 3d, E. S. Snow (Gerrick). *Bitches;* 1st, William Graham (Gaily); Herbert A. Graves (Pretty Lass); 3d, Charles H. Backhouse (Buzz).—UNCROPPED—*Dogs and Bitches:* 1st and 2d club, J. N. Annand (Fury II.); 2d, R. E. Palmer (Thady II.). *Puppies:* 1st, R. B. & T. S. Carey (Noggin); 2d, Charles Backhouse (Bundle).

SMOOTH-HAIRED TERRIERS.—1st, C. F. Copeman (Leading Star); 2d, Alfred George (Zazel).

BLACK AND TAN TERRIFRS—OVER 16LBS—*Dogs and Bitches:* 1st, J. & R. B. Troughear (Prince Arthur); 2d, Joseph Royle (Burke); 3d, J. W. Tucker (Duchess of Edinburg).—NOT OVER 16LBS.—1st, Webster Adams (Streamlet); 2d, Frederick M. Hurdle (Sunbeam); 3d, George Lodge (Laura). *Puppies:* 1st, C. C. Lawrence (Russian Prince); 2d, T. L. Puttock (Peter Piper).

SKYE TERRIERS—CHAMPIONS: Prize, James Pratt (Heatherbloom). OPEN CLASS—DROP-EARED—*Dogs:* 1st. Mrs. Jacobson (Cathullin) 2d, John Henderson (Pibroch); 3d, John B. Wilkes (Bob II.). *Bitches:* Prize, Mrs. Jacobson (Maggie Macdonald).—PRICK-EARED—*Dogs:* 1st, Rev. Thomas Nolan (Kingston Ray); 2d, James Pratt (Sandy Grant). *Bitches:* Prize, J. R. Kaye (Jaret).

HARD-HAIRED SCOTCH TERRIERS.—1st and 2d, Capt. W. W. Mackie (Dunolly and Dunora); 3d, Ludlow & Bloomfield (Worry).

DANDIE DINMONT TERRIERS.—CHAMPIONS—*Dogs:* Prize, John Sherwood, Jr. (Tarquil). *Bitches:* Prize, A. Steel (Linnet).—OPEN CLASS—*Dogs:* Equal 1st, W. A. F. Coupland (Border Prince) and J. C. Carrick (Pasha); 2d, J. C. Carrick (Fergus). *Bitches:* 1st, George S. Ball (Jennie Deans); 2d, Major H. Ashton (Duchess II.); 3d, William Carrick (Alma). *Puppies:* Equal 1st, J. Flinn (Percy) and W. Carrick, Jr. (Carlisle Venus); Equal 2d, Rev. G. S. Tiddeman (Mint) and J. Cunningham (Gilnockie).

PUGS.—CHAMPIONS—*Dogs:* Prize, Lady Brassey (Challenger). *Bitches:* Prize, Mrs. M. A. Foster (Jenny). OPEN CLASS—NOT OVER 20LBS.—*Dogs:* 1st, W. L. Sheffield (Stingo Sniffles); 2d and 3d, Mrs. M. A. Foster (Bradford Ruby and Diamond). *Bitches:* 1st, J. Drew (Dasey); 2d, Lady Brassey (Chiefess); 3d, Mrs. M. A. Foster (Maggie). *Puppies:* 1st, Miss Barlow (Tum Sing); 2d, Lady Brassey (Said).

YORKSHIRE TERRIERS.—Prize, Mrs. M. A. Foster (Bradford Hero).

MALTESE.—1st, 2d and 3d, Lady Gifford (Hugh, Rob Roy and Lord Clyde).

BLENHEIM SPANIELS.—CHAMPIONS—Prize, Mrs. L. E. Jenkins (Flossy II.) OPEN CLASS—1st, H. E. Jenkins (Trixy); 2d, Mrs. H. Arnold (Prince V.); 3d, George Coram (Bunchy).

KING CHARLES SPANIELS.—CHAMPIONS.—Prize, Mrs. J. A. Briggs (Alexander the Great).—OPEN CLASS—1st, Mrs. J. A. Briggs (Bend Or); 2d, Mrs. Eliza Forder (Jumbo II.).

TOY SPANIELS.—Equal 1st, Mrs. E. M. Monck (Chang II. and Kennedy's Duke of Anthony).

ITALIAN GREYHOUNDS.—Prize, Mrs. E. Bruce (Bankside Beauty).

TOY TERRIERS.—SMOOTH-HAIRED, NOT OVER 7LBS.—1st, R. Warren Vernon (Winnie II.); 2d and 3d, Mrs. M. A. Foster (Dinah and Dolly).—OTHER THAN SMOOTH-HAIRED.—1st, Mrs. M. A. Troughear (Conqueror); 2d, Mrs. E. M. Monck (Dolly); 3d, Mrs. M. A. Foster (Prince Arthur).

BANG BANG.

OUR illustration this week is of the orange and white pointer dog Bang Bang, owned by the Westminster Kennel Club, who imported him last summer from the kennel of Mr. F. C. Lowe, England. Bang Bang was three years old last month, he was sired by Price's champion Bang and is out of Princess Kate. He is of medium size, about 55lbs. weight, and a very stylish, handsome animal, he has a very good head and neck with shoulders that we have rarely if ever seen equaled His chest, loin and quarters are excellent, and his legs and feet are of the best. He is powerfully muscled and has lots of quality. Judging from his breeding and performances, both in the field and on the bench, we believe him to be a most valuable acquisition to the club as well as to breeders throughout the country. Bang Bang's first appearance in public was at the National Field Trials, Shrewsbury, England, 1882, where he won the pointer puppy stakes and the champion puppy cup. At the Kennel Club Trials, Blandford, England, the same year, he won the cup for the best pointer in the Derby, and at the St. Hubert Field Trials, Belgium, also the same year, he won third in the puppy stake and first in the All-Aged Stake. He has never been shown but once on the bench, winning first at the Crystal Palace Show, January, 1883. He ran unplaced at the Eastern Field Trials Club last November, but considering that he was entirely unacquainted with American game and ground until a short time previous to the Trials his performance was very creditable. He beat Don Juan, Scout, and Lalla Rookh, and was only beaten for the pointer cup by Vandevort's Don. Should he come to the post at his best next fall he will undoubtedly make a good race with the best of them. The cut is from a sketch by Mr. J. M. Tracy.

THE CINCINNATI DOG SHOW.

A NUMBER of valuable special prizes have been offered for the Cincinnati dog show, which commences March 4. All dogs entered in the regular classes will be eligible to compete for the specials without further entry.

The Independent Shooting Club of Cincinnati will give a three days' shoot during the bench show, on their club grounds. The shoot will commence on March 5, and will end on the evening of the 7th. Clay-pigeons will be used, and small sweepstake matches will be indulged in, so that parties visiting the bench show will have a chance to test their skill against the Cincinnati marksmen.

THE BEAGLE CLUB.

Editor Forest and Stream:

I wish to say to the members of the American English Beagle Club who take your paper, that I thank them for the honor conferred upon me, and I will do all in my power for the success of the club and its object. I have appointed the following on the committee to draft a standard: Dr. L. H. Twaddell, chairman, N. Elmore, Gen. R. Rowett. The executive committee are at work on framing a constitution and by-laws, and hope to report soon.

W. H. ASHBURNER, President.

TORONTO DOG SHOW.

THE Dominion of Canada Kennel Club will hold their second annual bench show at Toronto, Ont., on the 26th, 27th and 28th of March. We have received a copy of the premium list, which is a very liberal one. Over $1,500 will be given in prizes, besides $1,000 in specials. The Marquis of Lansdowne has consented to appear as patron, and is expected to open the show in person. The Pavilion of the Horticultural Gardens has been secured, which assures abundant space. Mr. Chas. Lincoln will superintend, and no pains will be spared to make the show first-class in every respect. Owners of fine animals in the States should improve this opportunity to compare the merits of their favorites with those of the cracks across the border, who will undoubtedly turn out in goodly numbers. Major J. M. Taylor, Mr. James Watson and Mr. W. Hendric, have consented to act as judges. Following is the prize list:

Champion English setter dogs $20, bitches the same; open dogs $20, $10 and $5, bitches the same, puppies, dogs $10, $5 and $3, bitches the same. Irish setter classes the same as the

English. Champion black and tan setters $20, open dogs same as the English, bitches the same, puppies $10. Champion pointers $20, open dogs same as setters, bitches the same, puppies $10 and $5. Champion Irish water spaniels $15, open $15, $7 and $5. Clumber spaniels $10, $7 and $5. Champion field spaniels $15, open $15, $7 and $5. Black field spaniels, dogs $15, $7 and $5, bitches the same. Champion cocker spaniels $15; open, black dogs $10, $7 and $5, bitches the same; other than black, dogs same as the black, bitches the same, puppies $10, black the same. Foxhounds $10, $7 and $5, puppies $7. Harriers $10 and $5. Beagles same as foxhounds. Deerhounds $10 and $5. Champion greyhounds $10, open $10 and $5. Champion fox-terrier dogs $15, bitches the same; open, dogs $15, $7 and $5, bitches the same, puppies $10 and $5. Mastiffs $10 and $5. Champion St. Bernards $10; open, dogs $10 and $5, bitches the same. Newfoundlands $10 and $5. Champion collies $15; open, dogs $15, $7 and $5, bitches the same, puppies $5. Bulldogs $10, $7 and $5, bull-terriers, Scotch terriers, Dandy Dinmont terriers, Skye terriers, Bedlington terriers, Irish terriers, black and tan terriers, broken-haired terriers, the same. Yorkshire terriers $10 and $5, pugs, smooth toys, rough toys, toy spaniels, foreign dogs, miscellaneous, the same.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal;*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

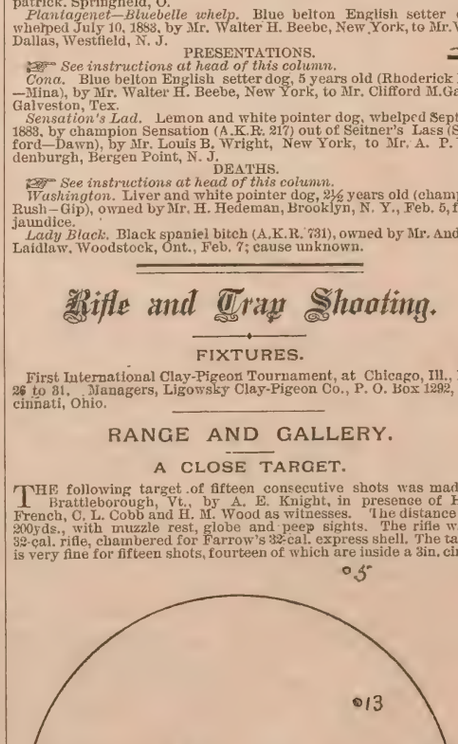
Lady Black. Black spaniel bitch (A.K.R. 731), owned by Mr. Andrew Laidlaw, Woodstock, Ont., Feb. 7; cause unknown.

Rifle and Trap Shooting.



FIXTURES.

First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

RANGE AND GALLERY.

A CLOSE TARGET.

THE following target of fifteen consecutive shots was made at Brattleborough, Vt., by A. E. Knight, in presence of H. C. French, C. L. Cobb and H. M. Wood as witnesses. The distance was 200yds., with muzzle rest, globe and peep sights. The rifle was a 32-cal. rifle, chambered for Farrow's 32-cal. express shell. The target is very fine for fifteen shots, fourteen of which are inside a 3in. circle;

the most remarkable feature is that thirteen of the bullets are inside an inch and one-half for "up and down," from 2 to 9. When we consider that this cluster is hard to beat with an ordinary 32-cal. at 50yds., the advantages of the express shell is readily seen, and proves the fact that .32-cal. is large enough for 200yds., off-hand.

CRACK SHOT.

GARDNER, Mass., Feb. 5.—There was a contest last week between the Brattleborough Rifle Club, of Brattleborough, Vt., shot at their range and the Gardner Rifle Club at Hackmatack Range in this town. The shots were exchanged by telegraph. The old Massachusetts target was used, with a possible score of 120 per man. The detail score has since been received, and is as follows:

Brattleborough Team.

M Lamb	9	10	12	11	12	12	11	12	9	10—108
G B Read	11	7	11	10	11	11	10	12	10	11—104

W C Loveland	10	10	6	10	11	9	9	10	10	0— 85—987

After the match had been shot and telegraphed seven of the home team with two other members of the Gardner Club shot another string, with the following result: G. F. Ellsworth 113, A. Mathews 111, I. N. Dodge 109, W. C. Loveland 107, S. B. Hildreth 106, G. C. Goodale 103, Frank Nichols 102, Fred. H. Knowlton 101, H. C. Knowlton 101, a total of 953.

BOSTON, Feb. 10.—When the 11 o'clock train from Boston reached Walnut Hill to-day, with a few shooters on board, they found the weather condition anything but conducive to comfort. A light drizzling rain was falling, but there was no wind to trouble the shooters, and some good scores were the result. Later in the day the rain ceased, and the light improved wonderfully. The feature of the day was the achievement of Mr. Charles, who, in the combination match, Creedmoor target, made nine consecutive bulls, finishing with a 4. On a second score he made a 4 and finished with nine bulls, making two scores of 49. The other scores are as follows:

Creedmoor Practice Match.

D Kirkwood	5554454515—46	H Cushing	4444544444—41
J E Darmoody (mil)	4454445544—43	C Pierce (mil)	3243444535—37

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE CLAY-PIGEON TOURNAMENT.

WE are in receipt of the official programme of the First International Clay-Pigeon Tournament, to be held at Chicago, May 27 to 31.

First Day.—International Championship Match, 10 A. M. to 2 P. M. Match No. 2: The Chicago sweepstakes, 2 P. M.; entrance $7; 5 single birds, 15yds. rise; fourth notch.

Match No. 3: Entrance $7, including cost of birds. 8 live pigeons, 26yds. rise; use of one barrel; Illinois State Rules to govern.

Match No. 4: The "miss and out" sweepstake; entrance $3; fourth notch; 18yds. rise; single bird.

Second Day.—International Championship Match, 10 A.M. to 2 P.M.

Match No. 5: The Ligowsky sweepstake; entrance $5; double birds; fourth notch. Five traps screened, to be placed at irregular points in front of the score, which must be placed 30yds. from furthest trap. The trap judge will prepare thirteen folded slips of paper containing each a number from 3 to 15 respectively, from which the shooter will draw one slip, which the judge will privately examine, and allow the puller only to see. The shooter is to walk in a general right line, from the score toward the traps, upon receiving the reply "yes" from the puller to his query, "are you ready?" When the shooter is under way the number of steps indicated on the draw slip, the puller will pull any two traps, one after the other.

Match No. 6: The miss and out sweepstake; entrance $3; fourth notch; double birds, 15yds. rise.

Sweepstakes.—In order to make the tournament attractive for all sportsmen, whether members of teams or not, the International Championship Match will, until finished, be commenced daily at 10 A. M., and continued until 2 P. M., after which there will be a daily programme of sweepstakes with 5 traps, as indicated. The executive committee reserve the right of adding to, omitting or changing any of the sweepstakes. All sweepstake (excepting the miss and out) purses shall be divided into three, 50, 30 and 20 per cent. Price of birds (clay-pigeon) three cents each. The Ligowsky Tournament Rules to govern, with such changes as the executive committee may

prescribe. Sweepstakes open to all excepting professionals and such as may be barred by the executive committee.

Third Day.—International Championship Match, 10 A. M. to 2 P.M.

Match No. 7: The professional sweepstake, open to all, including the "professionals," who are barred from the other matches, such as Dr. W. F. Carver, Captain Bogardus. Entrance $10; 5 traps; 6 single birds (clay-pigeons), 21yds. rise; fourth notch; 2 double birds, 18yds. rise. Seventy-five per cent. of the gate money for the day, with a guarantee hereby given by the Ligowsky Clay-Pigeon Company that the same shall not be less than $250, will be added to the entrance purses, to be divided into three prizes—50, 30 and 20 per cent.

Match No. 8: Entrance $7, including birds; live pigeons, 2 double rises, 18yds. rise; four moneys—40, 30, 20 and 10 per cent.; Illinois State rules.

Fourth Day.—International Championship Match, 10 A. M. to 2 P. M.

Match No. 9: The "twins" sweepstake team shoot. Any two persons form a team; entrance $6 per team; 5 single birds, 18yds. rise; fourth notch.

Match No. 10: "Miss and out" sweepstake, same as Match No. 4.

Fifth Day.—International Championship Match, 10 A. M. to 2 P. M.

Match No. 11: Entrance $10, including birds; live pigeons; 6 single, 26yds. rise, and 2 double rises, 18yds. rise; four moneys; Illinois State rules.

Match No. 12: "Home sweet home" sweepstake; entrance $7; 7 single birds, 18yds. rise; fourth notch; 3 traps, 10yds. apart.

INTERNATIONAL CHAMPIONSHIP MATCH.

Conditions—Club team shooting (5 to a team); 10 single birds, 18yds. rise; 5 double birds, 15yds. rise; Ligowsky tournament rules to govern, excepting as herein modified, and such minor changes as the Executive Committee may announce. Ten-bore and 12-bore guns allowed. Charge of powder unlimited; charge of shot, 4½drs. Five traps, screened 3yds. apart. Ties between teams to be shot at 5 singles, 21yds. rise, and 2 doubles, 18yds. rise. Special prize donated by the Ligowsky Clay-Pigeon Company: To the winning team, $750 guaranteed; to the best individual score, $250 diamond badge, cost guaranteed. The said badge shall be the absolute property of the winner, but it shall be optional with the latter to present same at the ensuing international tournament, when it shall be redeemed for $250 cash, to be deducted from the entrance fees, etc., in a match similar to this, to be again contested for in said match, and awarded to the best individual score. If said badge be not presented for redemption the Executive Committee will set aside the $250 cash as a purse for said best individual score in a similar championship team match.

The Ligowsky Clay-Pigeon Company desires it to be distinctly understood that they donate $1,000 over and above all receipts, out of their private treasury, for the above prizes.

Entrance fees $25 per team. Entrance fees and gate money, with the exception indicated in Match No. 7, (less cost of birds, grounds and advertising, not exceeding 25 per cent. of same), to be distributed as second, third, fourth and fifth team prizes—40, 30, 20 and 10 per cent. In other words, should said cost exceed the 25 per cent. of said monies, the Ligowsky Clay Pigeon Company will pay the same. Should less than 50 clubs enter this match, then a club may enter as many teams of 5 as it may see fit.

Clubs entering must be known as regularly organized gun clubs at least two months previous to this tournament; members of entered teams must be in good standing the same length of time, indorsed by the president and secretary of the respective clubs. Contestants belonging to two or more clubs must shoot with their home clubs. Contestants can shoot with one team only, and must be residents of the county from which the team is entered. If any attempt to evade this rule be discovered during tournament, entrance money will be forfeited; if discovered after, offenders will be prosecuted according to law.

Clubs should enter at once, by remitting $1 (balance of entrance money payable at Chicago, on or before first day of shoot), to the general manager and representative of the Ligowsky Clay Pigeon Company, care P. O. Box 1,292, Cincinnati, O. Copies of the rules can be obtained by applying to the latter, to whom all communications on the subject should be addressed.

The club teams will be called to the score in the order designated by the executive committee; said order will be determined by the dates of original entry, teams being allowed to choose accordingly; each team will remain at the score until it has finished; the members of the teams will be called to the score in the order designated by their respective captains, each member shooting at ten single birds in succession, and then (when the entire team has finished shooting at single birds) the members will, in similar manner, finish their scores at the double birds. Arrangements will be made for reduced railroad rates; this will be easily effected, as the National Republican Convention meets in Chicago June 3, with reduced railroad rates from all parts of the country.

BARRIER, Ontario.—The tournament at this place on the 5th and 6th inst. brought a large collection of marksmen together. The contestants shot at 12 birds each, 21yds. rise, for $200, divided into six prizes, Toronto Gun Club rules, miss two and go out:

First Squad.

J B Forbes, Woodstock	1 1 1 1 1 1 1 1 1 0 1 1	—11
D Blea, Carlton	1 1 1 1 1 1 1 1 0 1 1 1	—11

J Jones, Toronto	0 0	— 0

First tie, 26yds. rise.—Forbes 4, Blea 5, Pascoe 5, Wayper 5, Cockburn 4, Reed 5, Beatty 5, Shaugnessy 5, Swetzer 3, Wilson 3.

Second tie, 31yds. rise.—D. Blea 2, Pascoe 2, Wayper 1, Reed 2, Beatty 1, Shaugnessy 2.

Third tie, miss and out.—Blea 1, Pascoe 1, Reed 0, Shaugnessy 1, Wayper 111601, Beatty 111000.

LYNN, Mass., Feb. 9.—The Lynn Central held its eleventh shoot for the silver cup Friday. A strong wind, with snow, made the score look small, but there was a good party present. E. W. Webster won the clay pigeon cup for the second time, with a score of 11 out of the possible 20. J. W. Holden won the glass ball cup for the first time, with a score of 17 out of the 20. Eight sweeps at clay pigeon and four sweeps at glass balls were shot. Following were the winners in the clay pigeon sweeps:

First event, five clay-pigeons—Evans first, Webster, George and Randall second, Parker third.

Second—Webster first, Evans second, Arkerson and Parker third.

Third—George first, Webster and Parker second, Randall and Evans third.

Fourth—George and Randall first, Webster and Evans second, Parker third.

Fifth—Evans and Randall first, Webster second, George third.

Sixth—Webster and George first, Randall and Evans second, Parker third.

Seventh—Randall first, Webster and Evans second, Hardy and George third.

Eighth—Randall first, Hardy second, George third.

GLASS BALL SWEEPS.

First—Webster first, George and Lander second, Randall and Parker third.

Second—Parker first, Webster and Randall second, George and Arkerson third.

Third—Lander first, Webster and George second, Randall and Evans third.

Fourth—Webster first, Evans and Lander second, Randall, George and Parker third.

At the tenth shoot, Feb. 1, Evans won the clay-pigeon cup for the second time. The next shoot will be Feb. 15.

PROVIDENCE, R. I., Jan. 31.—The following is the score of to-day's shoot for the Ligowsky State Badge, held on the grounds of the Narragansett Gun Club:

C B Payne	1111111111111111101111	—24
E W Tinker	1111111101111111111111	—24
C H Perkins	1111111111101111101111	—23
E S Luther	1111111111111111011101	—23
L M Eddy	1111110101111111111110	—22
C C Gray	1011100101000010001100	—11

Ties on 24.

C B Payne	1111111101111111	—19
E W Tinker	1111111111101111 w	—15

Feb. 7.—In spite of the gloomy threatening weather, quite a delegation of shooters faced the five traps to-day at the grounds of the Narragansett Gun Club, and some very fair scores were made, though it was painfully evident that we need more practice in our double bird shooting, it being comparatively a new thing with the majority of the members. The first match was a postponed shoot for the State Ligowsky Badge. Following is the score:

Ligowsky State Badge.

E S Luther	1011111001111111111111	—22
E W Tinker	1011011111111011111111	—21
H L Palmer	0110101111111101111111	—21
G W Barney	1111110111111101011110	—21
C H Perkins	1010111111111101101011	—20
G W Cary	1101001111111101111111	—20
C C Gray	1111011101110001111101	—18
C M Sheldon	1110111101101011101100	—18

E. S. Luther wins badge second time.

Same day, double bird shoot, 10 pairs for club badge:

C H Perkins	1110111010110100011	—13
E W Tinker	1010101011010101110	—12

There were five more contestants for this badge who withdrew before completing their scores.

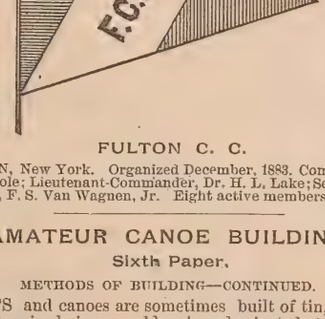
Same day, match for Ligowsky State badge, 25 clay-birds, 5 traps 5yds. apart, 18yds. rise, 4th notch:

G W Cary	1111110111111111111111101	—23
E W Tinker	0011110111111111111110111	—21
C H Perkins	1111100111001100111111	—19
L M Eddy	1010111011111101110101111	—19
C C Gray	1101001110111011111111110	—19
C M Sheldon	1111001011101010111111110	—18
G W Barney	0101011101111011101111101	—18
E S Luther	0111110011010100001w	
H L Palmer	0111111010101110100w	

G. W. Cary won badge for the sixth time.—W. H. SHELDON.

WORCESTER, Mass., Feb. 7.—There was a contest here to-day for the individual championship badge for glass-ball shooting. It was at Coal Mine Brook Range of the Worcester Sportsmen's Club. Among those present were Messrs. Bradford Moses, E. S. Ford, S.H. Barrett, Aaron Bragg and S. H. Moyott, of Springfield, and J. Cole and George S. Tidsbury, of Ashland. The judges were Ford, of Springfield; Tidsbury, of Ashland, and John Goodale, of this city. The match was for a possible 50, and were shot in strings of five as follows:

Moses	1111111111101011111101111111111111101111111111	—46
Holden	1111011111111111011011101111111111111111111111	—45



WELLINGTON, Feb. 10.—The Malden Gun Club held its regular weekly shoot at Wellington this afternoon, when a sufficient number of gunners were present to make the sport interesting. In the match for the gold medal prize, F. Loring won the first with a score of 20, while Fielding and Buffum followed with scores of 17 and 15, respectively, out of a possible 20. E. J. Brown won the second medal, with a score of 12, and F. J. Scott the third, with a score of 12 out of a possible 20. E. J. Brown was the winner in the matches for a keg of powder and a box of wads, the score in each instance being 8 out of 10. T. C. Fielding was the winner in the match for a bag of shot. The club will hold a tournament on Washington's Birthday.

Canoeing.

FIXTURES.

Winter Camp-fire.—Tuesday, Feb. 19, 8 P. M., No. 23 East Fourteenth street, Room 16. Subject—Tents and Camp Outfit."

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FULTON C. C.

FULTON, New York. Organized December, 1883. Commander, V. W. Poole; Lieutenant-Commander, Dr. H. L. Lake; Secretary and Treasurer, F. S. Van Wagnen, Jr. Eight active members.

AMATEUR CANOE BUILDING.

Sixth Paper.

METHODS OF BUILDING—CONTINUED.

BOATS and canoes are sometimes built of tin, copper or galvanized iron, soldered and riveted together, a method usually confined to ships' boats and lifeboats. Two tin canoes were present at the first meet in 1880, and seemed strong, light and serviceable, though of poor shape. No doubt an excellent canoe could be built of sheet copper, that would not leak, and would be indestructible; but the cost and weight would be considerable.

In order to obtain a smooth skin with the advantage of the lapstreak, the planks are sometimes rabbetted on their adjoining edges, half the thickness being taken from each plank, leaving smooth surfaces, inside and out, but thicker plank must be used than in the lapstreak, and the working is more difficult. In another mode the planking is in narrow strips, perhaps 1x¾in. One of these is laid in place and nailed through from edge to edge, into the keel, then another is laid alongside of it and nailed to it, and so in succession until the boat is completed. A few frames are needed to stiffen the boat near the masts.

In the boats made by the Ontario Boat Company these strips are tongued and grooved, then steamed and forced together, the strips in some boats running fore and aft, and in others running around the boat, from gunwale to gunwale. In shell boats, where a very fine surface is of much greater importance than in canoes, the skin is made of Spanish cedar, about ⅛in. thick, laid in four or six pieces, joining on the keel, and once or twice in the length of the boat, making one longitudinal seam and one or two transverse ones; but this method is not strong enough for canoes.

Paper has been used for the past thirteen years as a material for canoes, but although the boats are strong, tight, and but little heavier than the lapstreak, they have not become popular, and are but little used. The process of construction is patented, and requires both tools and experience beyond the reach of the amateur. Canoes have been built during the last five years on a similar system, using thin veneer in three thicknesses instead of paper, but, besides their great weight, no glue or cement can be depended on when long immersed in water; and they are open to the same objections as all double-skinned boats, it is only a matter of time before leakage begins, after which they are practically ruined.

One of the oldest modes of boat building was to make a frame of wickerwork or similar material, covering it with leather, a method still followed, except that canvas is substituted for the leather. This mode of building is perhaps the easiest of all for the amateur, and we shall devote a chapter specially to it further on.

MATERIALS USED IN BOAT BUILDING.

In small boats, where lightness and strength are of first importance, it is necessary that the material should be very carefully selected, both as to quality and as to the fitness of each kind for the required purpose. Beginning with the keel, the best wood is white oak, with a clear, straight grain. In planing it will be found that the grain of the wood in one direction splinters and roughs up, while in the other it lies smooth, and the keel should be so placed in the boat that the splinters or rough ends point *aft*, otherwise it will be torn in dragging over rocks and rough ground. In looking at the end of the wood, a series of concentric layers will be noticed. The piece should, if possible, be placed in such a position that the nails in it will pass *through* the layers, and not between two of them, for instance, in a keel the nails will be mostly vertical, so the layers of the wood should lie horizontally, and the same is true of the ribs, the nails through them being at right angles to the length of the boat, and the layers in each rib running fore and aft, thus avoiding any liability to split. Next to oak, either ash or yellow pine will make a good keel, but hickory should never be used in a boat, as it decays rapidly.

For the stem and stern, which are usually curved, the best material by far is hackmatack, or as it is sometimes called, tamarack, which may be had in knees of almost any curvature, from three to ten inches thick, or larger. For canoes a three-inch knee is the best, as if of full thickness, it may be sawn into three slabs, each of which will make a stem and stern. Oak knees are also used, and are very good, but heavier. If knees cannot be had, the stem and stern may be cut out of straight plank.

For the sides of a centerboard trunk, clear, dry white pine is good, but mahogany is better, though much more costly. The timbers or ribs are usually of oak, though elm is excellent for this purpose. The wood must be clear and of the best quality in order to bend easily. The best oak for this purpose is found in the shape of stave timber used by coopers for the staves of barrels. These pieces are from three to five feet long, and about two by five inches square, one being sufficient for an ordinary lapstreak boat.

For planking, the very best material is white cedar, varieties of which are found along the entire length of the Atlantic seaboard. It is usually sold in boards ¾, 1 and 1¼in. thick for boat work, and from 12 to 20 feet long. For small boats it should be clear from sap and knots, but for larger work that is painted, the latter, if hard and sound, do not matter much, in fact, the knotty cedar is considered tougher and stronger than the clear.

Where cedar cannot be had, white pine can be used to advantage; in fact, the amateur will often find it much easier to buy pine of ¼in. already planed than to work up the thick cedar himself, while pine is not so apt to change its shape in working, a source of much trouble with cedar. Where neither of these can be had spruce may be used, but it is inferior. Mahogany and Spanish cedar make excellent planking, but they are no better than white cedar and cost much more. Most of the English books on canoeing recommend oak for planking, but it is never used here, being too heavy.

For the bulkheads, floor boards and inside work white pine is the best; for decks, rudder and upper streak of planking, mahogany, and for deck beams and carlings, spruce. The gunwale may be of spruce or pine, or, if outside, as will be shown, of mahogany, oak or yellow pine, the coamings of the cockpit being of oak. Paddles and spars are made either of white pine or spruce, the latter being stiffer and stronger, but a little heavier.

The other necessary materials—nails, screws, metal work, etc.—will be mentioned in detail as are required.

DOUBLE vs. SINGLE.

"BOREAS" has an article in your issue of Jan. 24, concerning single vs. double paddles. It is well written, and his points are well taken. Wherefore, I get on my old rheumatic pins for an explanation.

"Boreas" refers to my canoe race against a guide, with a single paddle in a double-ended Long-laker, a race which came off in July, 1880. There was fun in that race. I did not paddle a "10 or 12lb. canoe," but the original "Nessmuk canoe," 17lbs. 13¾oz. She was at that time, so far as I know, the lightest clinker built cedar canoe that was in use anywhere. I had paddled her against a four-oared skiff and came out ahead. I had used the double blade years before I ever heard of Mr. McGregor and his Rob Roy. I no more believed that a lee-making, one-sided single blade could beat the double than I believed that a catboat could beat a Cunarder in an ocean race I spoke as I thought, and I backed my opinion—to a modest extent—with coin of the realm.

There is a general disposition among the guides of the North Woods to sit down heavily on any man who presumes to invade their domain and cheat the fraternity out of $3 per day by guiding himself. There were thirteen guides at the old Forge House on the morning of the race; I was alone, so to speak. Jim Barrett, the landlord, was friendly and sympathetic. Also Sam Dunakin, who held the stakes and was umpire. My opponent was Fred Hess, a muscular young guide of 170lbs., and a fine paddler. But as he paddled a canoe-built Long-laker, six feet longer than mine, and as I had 30 years the advantage of him in age with only 105lbs. of weight to carry, why, I was safe to win.

The course was from the Forge House landing to Bull Head Rock, two hundred rods. Bull Head Rock is crowned with a nail keg filled with stones to mark it in high water. It is always a land mark for the frequenters of the Fulton Chain. Jim Barrett gave the word "Go" and we went. I cut straight across the lily pads with an eye single to the nail keg. Fred in the Nellie took the open, but more circuitous channel.

About seventy rods from the landing the open channel cuts the point of the lily-pads, and at this point Fred was fifty yards ahead. The race was virtually lost to me. All the same, I paddled right along. A race is not lost until it is won. He might split or break a paddle, he might tumble overboard, or run on a snag—but he didn't.

He turned the nail keg thirty rods ahead. It was a bad beat, and sort o' reversed my notions of the paddle. Half a dozen guides with their boats had come out to see the fun. After getting my wind—for I was blown—I joined the sad (?) procession back to the Forge House, where it was vouchsafed me to hear something like the following conversation—not for my benefit—oh no:

First guide, with grim humor and sarcasm: "Well, Fred, you rather got away with our long-haired friend. Giv' him back his money of course, eh?"

Second guide: "Why Fred! I never expected to see you win a paddling race. Of course you won't keep the old fellow's money."

Third guide (my friend Dunakin): "Well Fred, you ain't much of a paddler; I can beat you left-handed. But you've come out ahead for once."

"Shall I give the old gent his money back?"

"What! You unregenerate heathen! Are you going to take money

from an old orphan, 93 years old, father and mother both dead, and 500 miles from home?" etc., etc.

Yes; it was witty, funny, humorous. But it was like the single blade that had beaten me, all on one side.

I recovered my wind. I enjoyed the fun as well as the rest, for wit is scarce; and a good hearty laugh is beyond the price of rubies. I was glad to see the guides enjoy it. In less than twenty-four hours the account of this trifling spurt had reached Blue Mountain Lake, it went all through the North Woods. Whenever I met the Nellie—and I met her often—some one would sing out "Hello, Uncle Nessmuk, do you know this boat?" And I always answered with a cheery Alleghany do-whoop, and said: "Yes, I know her, for stamps." Then they would laugh and row on.

All the same I held to my faith in the double blade. I had been beaten out of sight: it was time. But the little canoe was too short for racing; and, while I could fan her over the water at a three-knot gait as lightly as cork, it required a disproportionate amount of muscle to get another knot out of her. If I wanted five knots—well, I couldn't get there. And when I tried a racing gait she squatted down, wallowed, "snaked," and utterly refused to keep up with the procession. Notwithstanding, I believed then, I believe now, that had the motive power, the muscle, been the same in each boat, the result would have been very different. I was beaten about fifteen per cent. But my opponent had at least fifty per cent. the advantage in wind and muscle.

I went to my room with a sort of rubbed-down-against-the-grain feeling, and wrote to my builder (Rushton), giving a brief account of the race, and ordering another canoe at once—a racer. She was to be 12 to 13ft. long, 16in. beam, with an inch home tumble, sharp and plumb at sterns, 8in. rise at center, and to weigh about twenty pounds. With such a canoe, I thought an "old orphan" could manage to scuffle along with the single blades. Not that I desired to set up as a racing expert, but in that style of circus it seems more sociable to keep in line with the band-wagon.

Mr. Rushton rather discouraged me. "He would build the canoe, and she would be speedy, but cranky and unpleasant as a cruiser. I did wrong to race with a long lake. Did I know that the single blade was faster than the double? Yes; there was a Canuck guide at the meet of the A. C. A. on Lake George who, with his single blade, could beat the best double on the lake one mile in four, etc., etc."

I came down. I was hardly convinced, but I always drop to superior skill and experience; so I changed the order from racer to cruiser, and the result was the Susan Nipper, that some readers of FOREST AND STREAM will remember. She weighed 16lbs., was 10½ft. long, 27in. beam, 9in. rise at center, and was and is the most comfortable cruising canoe I have ever owned.

In the summer of '81 she was cruised in the Adirondacks. She has been ratched on buckboards and in baggage cars without cover or protection, and she is hanging peacefully out on the porch, as staunch as the day she met me at Boonville. In carrying capacity she is competent for a canoeist of 170 pounds; but for a man of that weight it would be advisable to add three or four pounds of good tough timber to her upper works in the way of stiffer gunwales and thicker skins. In everything else except size she is the counterpart of the Sairy Gamp. Each of them is light, pleasant, steady and comfortable, with all the speed that is necessary in a cruiser.

I am inclined to thank "Boreas" for a revival of faith in my old favorite, the double blade, and to doubt very much if the single can fore-reach on it under equal conditions. NESSMUK.

WELLSBORO, Pa.

A CANOEIST'S WINTER SPORT.

ON a cold day of the late fall several canoeists had repaired to the water front at Springfield, Mass., one of them, Commodore L. Q. Jones, of the Hartford C. C., to get ready for a down stream trip home, the others to see their visitor depart. This had not been Mr. J.'s first visit to his Springfield friends; on the contrary, so frequent had been his calls during the season that, on this belated occasion, some fun was poked at him; the prospect of an early formation of ice was making itself felt in the keen air, and this was mentioned to him as a providential circumstance. Nevertheless, he averred that he would come to Springfield, under sail, once more that season. "I think that you reckon without the host," remarked one of the entertainers. "And I'll come under sail, if I have to come on runners," was Mr. J.'s reply, as he glided out of ear shot.

A few days after this incident the Connecticut was rolling its waters under a cover of smooth ice, and the skaters had great sport of it. Canoeists, of course, were supposed to have laid away craft and tackle on the shelf. The Springfield gentlemen had also had opportunity to test the fine quality and solidity of the ice, and were now seated together in their place of business talking of their Hartford friend's inability to fulfill his promise of still another call, and discussing a plan of presenting him with an ice-saw, with directions for use, as a new canoe fitting, when, to their astonishment and merriment, in walked Mr. J., a sail in one hand, his skates in the other. He had been true to his word and come to Springfield under sail and on runners.

This incident may serve to remind canoeists that at least a portion of their tackle may be made use of for sporting purposes in the winter season. It is not related for the novelty of the thing, for sails have probably been employed heretofore by American skaters. A few years ago one of our monthly journals gave a description of a fine sail plan for skaters, together with illustrations. Some of the people of Northern Europe have used sails on skates for a long time past, the Norwegians employing an unusually powerful rig, a large portion of which is a topsail, with nece sary tackle, that can be hoisted and lowered by motions of the skater's head. This rig is said to develop an astonishing velocity.

Mr. J. made the mentioned trip, of about thirty miles, in virtually less than two hours, for being on the road three hours he lost more than one hour in walking around the rapids near Terry's Island on a very difficult path. This is excellent time, considering that he used a more moderate rig than the one spoken of. His sail is of triangular shape, similar to a flying jib, and is rigged up in the Cape St. Vincent style. It is made of light and strong cotton, Pride of the West, sewed together in narrow strips to give it strength. The upper, longer edge of the triangle is formed by a 9-ft. bamboo yard, tapering at the ends, so as to have some spring. The bolt lines of the two lower edges form a loop at the lower corner, between which and a loop at the middle of the yard a spreader, 5ft. long, is fastened in the fashion of an arrow on a drawn bow. The skater passes the lee arm between spreader and sail and grasps the yard with his hand. The whole sail weighs about three pounds, and can be comfortably stowed and carried, the yard being jointed for that purpose. ARSENIKOS.

HARTFORD, Conn., Jan. 31.

CANOE AND SNEAKBOX.

Editor Forest and Stream:

Sorry I can't agree with you as to the merits of the canoe and the sneakbox for cruising in open waters. The latter is probably the homeliest boat that ever floated, and I know by experience, that the denizens of the shores one visits in her will gibe the cruiser with all sorts of sarcastic remarks and allusions to "coffins," "punkinseed," etc., but when it comes to real service in wide waters, this ugly nondescript surpasses the handsome, saucy canoe in all points. She will live in a gale of wind that the heaviest ballasted Pearl would not dare face, and is almost unexapsizable; properly rigged, she will outpoint the canoe as a sailer; her stowage capacity is far greater; she draws less water than any sailing canoe; isn't so easily injured by bumps, and affords much larger and far more comfortable sleeping quarters than the canoe. She is hard to pull against a wind and sea, but there is rarely an occasion where this is necessary in bays or on large rivers or lakes, for the sneakbox will beat up wind as readily as a catboat. The peculiar shape of her bottom makes her easy to draw up on shore and push off again, and there is no necessity for carrying "shores" to "block the bilges," because a little working back and forth will settle her firmly enough in the sand to insure her stability as a sleeping apartment, and a canoe large enough and with sufficient weight of ballast to sail on open waters, will certainly be as difficult to handle ashore as the sneakbox. I never had any fear of leaks when sleeping in a canoe made for cruising in small rivers and streams, but I confess that sleeping in a ballasted canoe would give me "visions of future leaks," as the ballast, live cargo and plunder weighing heavily against the sides, even if she were blocked, would, in my opinion, be enough to spring the best made canoe. Of course, the sneakbox would be the clumsiest kind of a boat to use on small water courses or where there are portages, but for waters like the Potomac below Washington, the Hudson and the different bays, lakes, sounds and large rivers, I would by all means prefer her to any other boat for single-handed cruising. Her cost, which is half that of a fully-rigged sailing canoe, is another and an important point in her favor. SENECA.

WASHINGTON, D. C., Feb. 9, 1884.

SPRINGFIELD C. C.—Three new members have lately joined the S. C. C.: Messrs. E. H. and George Barney and Mr. George Pratt, of Springfield. Mr. Shedd has sold his Stella Maris canoe to Mr. W. H. Minick, of Pittsburgh, and will have a new model, 14x30, from Rushton. The new club house was flooded a short time since, owing to the water rising over the ice, the latter holding the house down, but it has been raised and dried out. The annual meeting of the club takes place this week.

N. Y. C. C.—The two persons captured while robbing the club house at New Brighton have been held to appear before the Grand Jury.

THE CHART LOCKER.

V.—INLAND WATERS OF MAINE.

Editor Forest and Stream:

I should like some information in regard to cruising in inland Maine, which I think you or some of your correspondents might give me.

First—I should like to know if there is any way to get from Moosehead to Megantic Lake, the latter, I believe, is the source of the Chaudiere. Then if one should get there, could they go down that river to the St. Lawrence in a light Stella Maris canoe, drawing not over 3½ inches?

Second—How long is the portage between the Kennebec and Dead Rivers? The time I should take would be July, and would there be enough water then? Also would there be enough water in that month to pass through Chesoncook and Chamberlain lakes to the St. John's?

Third—Can one pass through the Telos Canal and into the east branch of the Penobscot? If so, how long is Indian carry? Could one get from there into the Aroostook? or would they have to go by Spider and Mansungun Lakes?

Any information would be gladly accepted, especially in regard to the depth of the water in July, and in regard to the passability of the Chaudiere. X.

W. S. offers to give information about Oswego, Oneida and Cayuga rivers.

THE LOG BOOK.

V.—LOWN THE MISSISSIPPI.

[*Continued from page 35.*]

WE left Memphis Nov. 4, with a white-ash breeze and made about 35 miles. For the next two or three days we were favored (?) with head winds, against which we found it impossible to make progress, as our boat, having no flare to the bow, nosed into the short rollers kicked up in the current, and the deck was washed from bow to stern. Any canoeist who starts on a Mississippi cruise in a "smooth water" canoe will fare very badly, to say the least. I regretted exceedingly when poking into the head seas that I did not have the Spray along, as I think that her flaring bow would have kept her perfectly dry.

In my opinion the Sandy Hook is the model for Mississippi work, as I have found from my experience on Lake Michigan that it is next to impossible to take a sea in over the bow, even while sailing in very choppy water. Of course I don't consider those things that slap on the side and then deposit about a bucketful of water in your lap, for no power on earth can keep them out. The sharp boat, depending entirely upon sheer for dryness, will make very poor work of it, for though the water may not be able to get on deck right over the stern post, it will sneak over a foot further back, and once on deck, it don't stop short of the cockpit. Our coaming was 2½in. above deck and was very little protection in beating.

We reached Vicksburg Nov. 17, two weeks out from Memphis; the distance being 400 miles. The three days preceding our arrival at Vicksburg we had north winds which, although favorable, were colder than was comfortable. We used to retire with all the clothing on that we could scrape up, and besides I had a pair of woolen blankets and a cotton comforter, while B. had two pair of blankets; but notwithstanding all our endeavors we couldn't keep warm. Water left in the Spider over night was frozen solid, and the deck of the boat would be white with frost. I don't want any more sleeping in a tent in that kind of weather.

Vicksburg is not what you would call exactly on the river, that is the same as Memphis or New Orleans. The river has changed since the war, and where was once the channel, is now an island and a thought it was willows and wild ducks. The boats land about a mile below the center of the town, but they are able also to go up the "old river" and around the island in front of the town in good stages of water. In high water they go right over the top of everything. I would like to be able to explain the change which the river has made, but it would need a map to make it clear.

All along the trip we heard of "old rivers" and "cut offs," and the changes which have been made fill one with wonder. Island No. 10 is gone, and nothing remains but a sand point, for the chute has filled up and it is no longer even an island. The mouth of the Arkansas River is stopped up with a sandbar as high as the bank, and to enter the river one must go up into White River about six miles and then through a "cut off" into the Arkansas. You don't see the mouth of Red River at all, for it comes in behind an island, into an "old river," and thence into the Mississippi.

We left Vicksburg Nov. 18 in a dead calm, which lasted during the next three days, and reached Natchez Wednesday, the 21st; distance, 120 miles. We rowed all the way, and averaged about forty miles per day. We had had perfect summer weather since leaving Vicksburg, but had been threatened with rain, which finally came. We left Natchez about 4 P. M., and rowed down the river, looking out for a bar, but we went on for twenty miles without striking one.

At nightfall we thought we saw a good place on the bank, but we found it so uneven that we couldn't use it. A darky who was hunting up driftwood, told us that there was a bar just down in the bend, about two miles further on. So we started out for it and finally struck it at last, for it comes in behind an island, into an "old river," and thence into the Mississippi.

We left Vicksburg Nov. 18 in a dead calm, which lasted during the next three days, and reached Natchez Wednesday, the 21st; distance, 120 miles. We rowed all the way, and averaged about forty miles per day. We had had perfect summer weather since leaving Vicksburg, but had been threatened with rain, which finally came. We left Natchez about 4 P. M., and rowed down the river, looking out for a bar, but we went on for twenty miles without striking one.

At nightfall we thought we saw a good place on the bank, but we found it so uneven that we couldn't use it. A darky who was hunting up driftwood, told us that there was a bar just down in the bend, about two miles further on. So we started out for it and finally struck it at last, for it comes in behind an island, into an "old river," and thence into the Mississippi.

That rather disgusted us, and we concluded to quit the "skirt" business and make for the current, and then strike for the bar about half a mile further down, which we did, and had no difficulty in landing. We pitched camp and got supper, and then drew up the boat and tied her to a stake driven in the sand. The bar here was about one foot above the water, but ascended gradually until 100 yards back it was fifteen feet. We retired early, but were very soon awakened by the rain which came down in sheets, accompanied by a strong wind. However, the tent was perfectly dry, so we turned over and went to sleep again.

About 7 o'clock I was aroused by B.'s "Wake up! The boat has gone and the water is around the tent"—a very effective eye-opener, I can assure you. The heavy rain had washed out the stake and the sand from under neath the boat, and the wind had blown her out into the current and so on down stream. We dragged the tent about fifty feet further back on the bar—getting thoroughly soaked during the operation, for the rain still continued—and started out to see where we were.

An inspection of our surroundings did not raise our spirits any; for, after making the entire circuit of the bar and finding only water, we came to the conclusion, reluctantly, though very naturally, that we were on an island. Recognizing the fact that we were "in for it," and that there was no use trying to do anything until the rain should stop and the fog lift, we betook ourselves to the tent, changed our wet clothing for dry, and started the oil stove in order to keep out as much dampness as possible.

The tent was wet and everything was clammy, and we felt very "blue" as we sat there waiting for the rain to let up, which it finally did about 5 P. M. There was a little "pocket" setting back into the bar, about fifty feet from the tent, and it was alive with teal, which quacked away and splashed around at a great rate, and the painful fact that we were without a gun made the cerulean aspect of things assume a still deeper hue.

A steamer passed down shortly after dark, and I nearly split my throat trying to make them hear me; but she was half a mile out in the channel, and although my first hail was answered, wouldn't stop. I gave it as my opinion that the river would continue to rise on account of the rain, and that we had better move the tent still further back on the bar, but B. thought differently, so we let it stand and went to sleep.

About 2 o'clock in the morning we found ourselves flooded out worse than on the first night, and had the pleasure of moving all our truck at that unseasonable hour. We had to fish for our dishes, which had been left just to one side of the tent, and succeeded in getting everything except two plates. In the morning we found six inches of water where the tent had been. J. W. KEOGH.

CANOEING ON THE WEST COAST OF FLORIDA.

Editor Forest and Stream:

I beg to report the safe arrival at this place, of Mr. Charles N. Morris, of Cincinnati, in his canoe Nellie Morris, a Princess model, built by Rushton, 15ft. x36in.

Mr. Morris reports: "Left Cedar Keys Dec. 25, at 12 M., under sail. Wind S. E. Gulf very rough. Had made a bargain with a boatman to pilot me to St. Martin's Reef, I was to follow his sailboat, but about 5 P. M. my pilot was out of sight. Weather thick. Sea heavy and was getting worse. I began to be a little uncertain about my canoe living through it, ran for land, came to some ugly reefs which frightened me more than the sea had done.

"Battered round among the reefs until 9 P. M., when I saw two lights, took in sail and made for the lights under paddle. Finally lost the lights, and soon became lost myself in a complete maze of reefs and mangrove islands. After trying in vain to find a landing I commenced yelling at the top of my voice, and very soon I saw a light, made for it with all my remaining strength (which was not much for I was nearly worn out), reaching the light at 12 P. M. It proved to be the light of Dr. Hodges, Hickory Island. I turned in in Florida style and was thankful.

"Left Hickory Island on the 26th, ran to Crystal River where I camped. On 27th got underway and found St. Martin's Reef, but I lost myself; for four weary days and nights I was trying to get out of the tangle of reef, shoals, marsh islands, etc. On the morning of my fifth day in the reefs, I sighted a small sailboat, and after setting signal of distress, and shouting and signaling I managed to attract their attention; they hove down, and piloted me safe into Bayport, where I recuperated thoroughly before I ventured on another start."

Mr. Morris tells me that he intends to cruise on the Florida coast three months yet, so you will doubtless hear more from him. He expresses himself greatly delighted with canoeing with the exception of getting lost in the wilderness of St. Martin's Reef. TARPON.

TARPON SPRINGS, Fla., Jan. 27.

THE GALLEY FIRE.

CAMP OUTFITS.

Editor Forest and Stream:

Among the many sensible, practical communications published in our old "stand-by," FOREST AND STREAM, few, in their way, have been so worthy of recognition and adoption as the letter of S. D. Kendall, in your issue of Jan. 17, headed "Camp Kits and Cookery."

This letter, with its *multum in parvo* style, contains precepts whose example should be followed by the thousands who, as the hot summer months take them in vain forcibly make it, throw off (?) every care and betake themselves to the mountain wilds, ostensibly to enjoy themselves; yet do they really enjoy themselves? It is true they drop their fly into the crystal mountain stream and extract its living treasures in countless numbers; they scour the forests and their splendid breech-loader, and perfectly trained hunting dog, will bring to bag all the fur and feather within range; still there is a barrier, though not an insurmountable one—it is the presence of a surplus amount of troublesome luggage which pleasure-seekers imagine to be so highly essential to comfort.

I do not wish to boast in the least of what I have or have not done in connection with camp life in the wilderness. Suffice it to say that I have spent the greater portion of every summer camping out since I was ten years old, and I have yet to see the first time when I shall take a cot, oil stove or any of those articles which properly belong in the city mansion and not in the mountain cabin.

In the eating line the same mistake is obvious at once to an ordinary observer. Our poor, broken down city dyspeptic decides to mend, if possible, his ill health. What course does he pursue? He packs up three or four immense boxes of the richest and most indigestible food, and lugs them off to some locality where, as he says, he "can enjoy the pleasures of camping out." How little does this poor mortal even suspect that he voluntarily and deliberately robbed himself of the very object in camping out. Not content with subsistence on the products of forest and stream, humble yet unapproachable as they are, he returns home wondering why it is that he is feeling worse than when he left his home to seek a cure he did not find.

True enjoyment in the woods, the sojourner must remember, is obtainable only by reducing his paraphernalia to a minimum; learning to hunt for his own food, how to cook it, and lastly, to adapt himself to the humility of his immediate surroundings.

If he learns these few things, he initiates himself into the secrets of pleasure and happiness in the wilderness. C. A. R.

PRACTICAL COOKERY—GRIDDLE CAKES.

Mention has often been made of griddle cakes by correspondents of FOREST AND STREAM, but no hint is ever given of the mode of preparation. Perhaps it is unnecessary; but as there may be some uninitiated, here is our method. It will take the place of bread any time, and as it can be made in a very few moments, is fresh and light and generally more agreeable. Self-raising flour may be used or common flour and baking powder. If the latter is used take four half-pint cups flour, three teaspoonfuls baking powder, and one small teaspoonful salt; mix these thoroughly together dry. Then add shortening, one tablespoonful lard or butter, and work through with the hands; next water or sweet milk, or half and half, about three gills, and mix into dough; the less mixing the better. Have spider hot and greased with lard, a little larger than a walnut; place cake (which should be flat, round, and the diameter of pan) in spider and cover as soon as mixed. The quality of cake depends in a great measure upon the cooking. The pan must be hot to make cake rise, but not so hot as to burn crust before the inside is cooked. When nicely browned remove cover and turn. One attempt will suffice to teach anyone. Cooking is like everything else; go at it boldly and confidently and you have won more than half the battle. Timidity in the amateur has ruined many a good dinner.

Wheat Cakes.—One quart milk, three eggs, and enough flour (with baking powder and a little salt added) to make a thin batter. Cook on spider over brisk fire. The proportion of baking powder to flour is always about one and one-half teaspoonfuls to one pint. Q.

NUMBER TWELVE.

THE cutter building at the yard of Lennox, South Brooklyn, will be named Merlin. She is from a design by Mr. Geo. H. Ripley for some Brooklyn gentlemen. Length on loadline is 25ft., beam 7ft., and draft 5ft. She is being built by Daniel Bernard, and is so far the best job turned out in these parts. For fairness, first class material and workmanship, this cutter is an example a long way ahead of ordinary practice. The frames are single, steam bent fore and aft, with metal floors, and all the plank, deck stuff, clamps, etc., will be in one length from stem to stern. There is 3,750 pounds of lead on the 2x5 oak keel, secured with ¾in. composition bolts spaced 12in. apart. Lower sails contain 750 sq. ft., the mast being 10ft. from stem, and bowsprit 13ft. outboard. The model is extremely handsome. Midship section is powerful and roomy, an average between a peg-top and a U frame in shape. The timbers gradually straighten up in the forebody, and in the after half the floors are lifted by degrees to give a clear run with quite sharp water lines, the area of the loadline being well preserved nevertheless. The boat has no lump in the middle, but a good long body without any straight. The areas of cross sections have been carefully apportioned, according to Collin Archer's formulæ, and a good balance is preserved between the ends when heeled, the inclined water lines showing no humps or hauncles. Fore foot is well clipped away and post has moderate rake. The least possible wet surface has been secured with sufficiently fine lines and the largest internal room with just the right amount of bulk and displacement.

As a well digested and highly finished model, all its parts with no feature carried to excess, and yet nothing neglected, with a body which has the plumpness of a Hebe and the grace of a Venus in one, this new cutter promises to be a most taking and useful craft in every respect, and ought to prove a good one for racing in all kinds of weather. She will have a flush deck according to modern ideas, with a small cockpit for the convenience of ladies. Below there will be a big lot of room with the cosy and delightfully cool cabins for which cutters have become known. The forecastle will be long, with a birth for one hand. The cabin is to contain two long sofas, with pantries, closets and general stowage and a swing table. At the after end are two lockers reaching from floor to deck, with the companion ladder leading down between. The doors of these lockers can be swung athwartship forward of the ladder so as to act as a partition bulkhead to the cabin, by which privacy can be secured should it be

desired: Abaft the ladder is a small space of floor with a sleeping berth on one side, the end dovetailing alongside the cockpit, the opposite side being devoted to sail room. Ice chest and water below the cockpit floor. On deck there will be a hatch to the forecastle, cabin skylight, and the main companion with a quadrant slide. With all the beam necessary to make a very stiff and buoyant boat, with a high side to keep her dry, good draft and outside weight to keep her down to business in rough water, and more room below and on deck than in sloops of much greater size, the Merlin is certain to be a popular boat among all classes, and a worthy representative of the cutter for length measurement racing.

STEAM YACHTS.

OH, yes, explanations. Awfully small world this. Can't put your foot down without walking on somebody's Sunday bunion. I don't mind the owners of steam yachts who have been buzzing round my ears since I wrote a few words about them two weeks ago. I meant what I said. I have no more regard from a yachting standpoint for those forgotten-looking individuals on the back area of a steamer who allow themselves to be screwed around by a lot of hired servants and take no more interest in the whole business than to growl at the bills. I say back area, because it would be a slight to a proper quarterdeck to apply such a smart appellation to the after end of the shoal traps housed in with tenements to supply deficiency in freeboard which New Yorkers think the pink of perfection in that class. But when the builders of steam yachts arise in fire and want to know what I meant by deriding small screws, then I jump up to explain. They at least can tell the difference between a trap and a yacht. Now, I said nothing at all against steam yachts. On the contrary, I like them and easily understand their use from a spo ting point of view. There is just as much and perhaps more skill in steaming a vessel than in sailing. It was not the yachts against which I inveighed but the languid superficial methods in which owners pursued the business and their want of discernment in building. To follow and perhaps master the management of boiler and engine is particularly instructive and entertaining and of great practical benefit. The studious and observing owner of steam yachts has opportunities of conferring inestimable profit to the science and practice of steam engineering, even though he declines to roll up his sleeves, but simply directs and delegates the work to others.

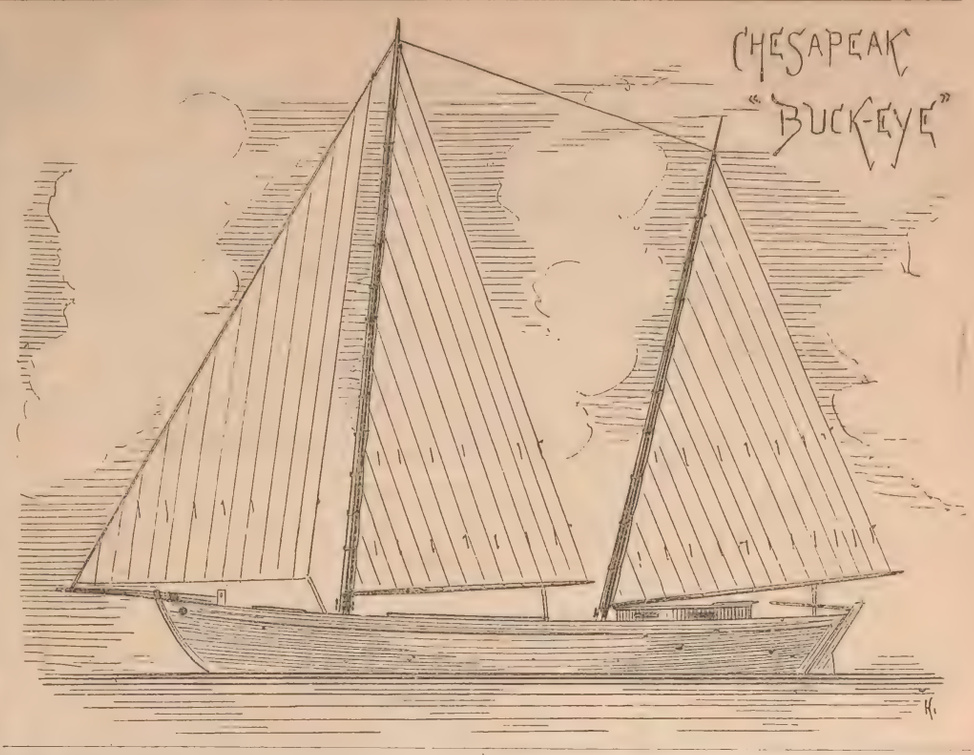
Furthermore, to take charge of a steamer's deck is no child's play, but calls for quick perception, good judgment and executive ability, in the display of which your genuine steam yachtsman delights. Nothing could be more attractive or intensely absorbing than experimentation upon the numerous vital questions before the engineering world to-day, and the man with money starts out with a long lead in the race for contributing to the world's stock of knowledge and enhancing his own reputation and that of his yacht. Now, how much has any one owning a steamer in America earned the regard of the community as a man with brains besides money? Such experiments and innovations as have been undertaken have brought about nothing, unless they have made some yacht owners a butt of ridicule more than anything else. Crude departures, forbidden by tried and accepted laws, repetitions in directions long ago found out to be impossible with the inevitable failures, a reverence for the antiquated, and persistent disregard for the lesson taught elsewhere in the world, these represent the "progress" for which we have to thank the wealthy people who are ridden round by engineer and master.

Why should I take kindly to the sprawlin', low-waisted Omises, Entures, Ulies, Urlines, Ajahs and like contrivances which, though 100ft long, dare not follow a match round the Sandy Hook lightship in moderate weather? Or to the clumsy Stranglers, Horsehairs and Appleantas, which differ from coasters and carriers chiefly in gilding and paint? Oh, no; I like a steam yacht, but not the awful ghosts we see in these waters. I might mention one building concern who manage to get a flush deck and good seagoing qualities on a light draft for Florida waters, and high speed on small consumption with light weight of machinery occupying small space. And I might mention a string of good serviceable flush-deckers abroad, no longer than 50ft., all of which challenge respect in their modelling and lit tings, as well as in engine efficiency. And I might mention good little launches at home and abroad combining safety, simplicity, and even high speed. And as long as I can do this, I propose to be excused from chanting praise to hybrids half awash, loaded with boilers and tug engines which are failures as high speeds, and caricatures as cruisers. I can appreciate the steam yachtsman, but turn up my nose at the lazy steam dawdler, who is a cipher in the sporting and intellectual world as much as the feeble drifter in the cockpit of a craft propelled by sails. For the amateur tar on deck and the amateur mechanic in the engine room I have sympathy to the extent of admiration. The best tools for their purposes is what I am after. It is not steam yachting I condemn, but the shams of the real article, whether in men or in the boats they own. C. P. K.

THE MEASUREMENT CONUNDRUM.

Editor Forest and Stream:

Many like myself—my remarks are purely local—have been forced into the ungainly "spread-outs" because symmetrical forms were not protected. We have been groping about under a length measurement cloud all our lives. Is it strange, then, that we have run into excess of beam, even to the extent of two-thirds the length in width? Builders and owners alike are tired of the strain. Reduction of sail is conducive to easy forms, and leads up to better models and rig. And yet if you tax sail area, do you not tax shape as well? I cannot see my way out of the fog. When two boats are of the same size (equity), and one by her superior shape is enabled to carry more sail than the other, is she not in all fairness entitled to it? Otherwise you put a veto on progress. Most of our yachts have been built under a protest. The unfortunate designer had no alternative under the old regime but to line out his boat with as little resistance as possible with the greatest bulk and keep out of gaol. The smooth-water crafts have had their day even with us on the Delaware. Big hulls, heavy spars and badly shaped sails towering skyward, will no longer tyrannize over the modest, honest little craft which fearlessly fights a way in bad weather in our bay or along the coast, where expensive racing machines twice as large dare not venture. Small seagoing boats are coming into favor, and the new boats, regardless of the present rule, are being built with an eye to safety as well as speed. If our Quaker City Yacht Club still persists in measuring by length, then these boats will form a class of their own and sail under their own rules. As a member of the club I hope something definite will be done this season to emancipate intelligent builders from the thralldom of coercion. The London *Times* has been pleased to admit that "Philadelphians can build boats." So they can, and did, even as remote as 1776, and in later days produced a Vixen. That Dr. Valette, the prospective commodore of the Q. C. Y. C., in his judgment saw fit to throw his Esculapian eye eastward for a 70-ft. yacht, is no guarantee that the flagship will be better than a home-built vessel. The club will elect officers this month for the present year. R. G. W.



PHILADELPHIA.

[The objection to sail area rule raised by our correspondent is a perfectly proper one. It is the weak spot in the equity of the rule. To a certain extent and in certain cases it is a direct tax upon form which cannot be equitable. But between two evils choose the lesser. The length rule prescribes all but the most extravagant forms and sizes. The sail area rule bears hard on extravagant forms and sizes and encourages a more moderate average. A fair rule ought not to weigh upon any style more than another. A bulk rule bears upon size and not upon the form that size assumes, hence it is the only rule ever devised which can apply to every form under the sun without prejudice to any particular shape. A tax upon ten tons or a hundred cubic feet leaves the builder absolutely free to mould such volumes as he pleases in all directions. Neither the length nor the sail area rule can be defended upon logical or equitable grounds. Both are purely empyrical standards. As the sail area rule avoids extremes, as far as its workings are at present understood, it seems to us a preferable standard of comparison than simple length, as a makeshift, however, until the public is ready to grapple with the question more thoroughly than at present. Objections have been made to the sail rule on the score of complexity. But such persons are in need of fresh schooling and have no business to assume leadership in anything. The man who cannot read off a tapeline, then perform a simple sum in arithmetic, should wear a dunce's cap instead of putting in his oar on the question.]

NOTES FROM THE DELAWARE.

Editor Forest and Stream:

The yacht Nohma, formerly the O'Donnell, has been sold to Mr. Ferry and others of Trenton, N. J., and is now at the builders' yard undergoing the necessary alterations for a cabin, etc. She is 38ft. long, of large displacement; 2,800lbs. of iron will be placed on keel, centerboard trunk will be cut down one-half, she will have two iron boards, one working within the other with independent pivots. When completed she will be non-capsizable and fit for sea. It will be seen the Trenton public reads FOREST AND STREAM, and don't forget what they read. The O'Donnell last year entered in two races, winning third prize in her class in the Q. C. Y. C. regatta, and first prize in Klotz regatta in which the Q. C. Y. C. participated. She on this occasion beat the fleet big and little, and is one of Mr. Collins's best productions. Mr. Ferry was not asleep when he bought her, and is now wide awake to the improvements now being made. He and the builder are in perfect accord, believing a safe boat is not necessarily slow, which they hope to prove. X.

CHESAPEAKE CRAFT.

Editor Forest and Stream:

Mention has been made several times recently of the Chesapeake Bug-eye. The etymology of the term makes it "Buck-eye." These boats are an exaggeration of the "dugout" canoe, and were developed gradually by the bay shore people, as the necessity for larger boats became apparent. It was easy to get almost any desired length in a single log, but not so as to beam and depth. Very natural it was to add to beam and depth by building up and out with logs bolted to the sides of the long, narrow and shallow dugout. This was done, and masts and sails added to suit the increased size. A large boat required anchors and cables instead of being dragged up on the beach, as with the small canoe. The primitive builder bored two holes, one on each side of the stem, through which to pay out his cables. These were simply two round holes, bored with a large augur, and when the boat was coming head on, resembled, to the fancy of the negroes, the eyes of a buck. The illusion was somewhat increased by the addition of a bowsprit and its attendant gear. The leg-of-mutton sail—the primitive sail of all nations—was adopted, with two masts; the bowsprit and jib being a later accession. This is yet the favorite rig of canoes of thirty feet in length and under.

As before observed, length being the dimension most easily attainable, the Buck-eye was built long and narrow, and being heavy in body but easily driven through the water, with a low center of effort for its sails, it proved a fast and stiff boat. It was sharp at each end; the greatest beam was about one-third the distance from stem to stern, hence sloping by easy lines fore and aft, giving a clear entrance and good clearance. As to deadrise, it was a matter of choice or convenience. Generally the deadrise was slight. Its entire construction depended on convenience and economy. It had no overhang, because it was easier and cheaper not to have any. It had no stays to the masts, because it was cheaper not to have any, and besides a "springiness" to the masts was considered desirable, because sudden flaws were not so likely to knock down. The centerboard was always inserted, because the Buck-eye was intended for the shallow waters of creeks and inlets as well as for the waters of the bay. One peculiarity was the manner of stepping the masts. The foremast was longer than the mainmast and did not rake so much. To the mainmast was given a rake aft. The negroes say it makes them sail faster on the wind. In small canoes the mainmast is shifted, so as to stand upright when sailing before the wind. The accompanying sketch indicates the rig and position of the masts. Of late years imitations of the old-fashioned Buck-eye have been regularly built, timbered and planked, and the beam has been increased. This has necessitated an area of sail, and the schooner rig has been used. Sometimes only the foresail has a gaff. The genuine Buck-eye rarely has less than five beams to the length. The modern imitations sometimes have less than four. This puts them on a par with other broad, shallow boats.

The Buck-eye has a well-deserved reputation for speed and seaworthiness. It pounds somewhat in a heavy sea, but its weight forces it through, if not over, the combers. This makes it a rather wet boat, but the exhilarating sensation produced by great speed, and a sense of security at the same time, makes amends for the inconvenience of flying spray and a wet jacket. Last summer I cruised in company with a Buck-eye, 42ft. long, manned by two gentlemen of Baltimore city. She drew twenty inches without the board. In sudden and heavy flaws she was rarely luffed. She would lie over and appear to spill the wind out of her tall sharp sails, and then right again. Her crew took pleasure in tackling every sailing craft for a race; nothing under 70ft. in length ever beat her. She steered under any two of her three sails. On one occasion this craft, on her way from Cape May to Cape Charles, was driven out to sea before a heavy northwest blow. Her crew, the aforesaid gentlemen, worn out by fatigue, hove her to and went to sleep. She broke her tiller lashing during the night, and when they awoke, she was pegging away on a southeast course under her jib. They put her about, and in twenty hours were inside Cape Henry, pretty well tired out. Buck-eyes frequently run from Norfolk to New York with fruit. For shallow waters, I am satisfied there is no better craft afloat. Built deep, with a loaded keel, they would rival the English cutter in seaworthiness and speed.

We have another style of boat in the Chesapeake, the American rival of the English deep boats. It is here styled a pungey. The pungey is regularly built, that is, timbered and planked and is narrow and deep, with no waist to obstruct the seas that may sweep over her. This is a remarkably fast and able sea boat, much used for oyster dredging in winter. It is a saying here that "when a pungey reefs, a steamship had better make harbor." I beg leave to commend our Buck-eye to shallow-water sailors and our pungey to deep-water sailors, suspecting that either would be an improvement on some of the fancy yachts of our Northern brothers. BUCK-EYE.

BALTIMORE, Feb. 3, 1884.

[The "pungies" of the Chesapeake are smart, handsome crafts with many of the elements of a good vessel. The best of them have moderate beam, considerable depth and great deadrise with a V bottom. Also keel with much drag, well rounded up forward and great rake to sternpost. With the necessary refinement of lines, outside weight and corresponding increase of rig, they would rank high in all respects. They can be classed about half way between the New York pilot boat and the racing cutter.]

CONCERNING SAILS.

Editor Forest and Stream:

Let me say through your paper a few words concerning sails for yachts. Most owners insist upon too light duck. This is a mistake, and a great point in favor of small English yachts, which use duck almost double the weight we are accustomed to. Where I have my own way I always advise heavy duck. It is better for light winds, at least in the lower sails. They sit flatter and can be kept in better shape. Ballooners should of course be light. The speed of cutters in light airs I ascribe to some extent to the weight of their lower sails and large topsails, and jibs for catching the fitful breaths. I can see no object to a loose foot, however, when a laced sail is properly cut to sit flat. MAKER.

[There is much about sails difficult to explain in words. We prefer heavy duck for lower sails in light winds according to English experience. We offer this reason. Light sails not only bag, but give locally to the puffs. The force of the wind is expended in creating the bag or pucker in a spot, and nothing remains to slide along the surface of the sail, and transmit its energy to driving the boat. The local pucker imprisons and kills the light breath. But in a heavier sail, after striking, no local cul-de-sac or give cushions the breeze out of its strength, but the sail has enough stiffness to resist without being devoid of enough elasticity or spring as a whole. The wind caroms along and escapes around the leech, the time and means being supplied for transferring its impulse to the boat. A loose foot aids in the same way. The sail gives as a whole, as one surface to the puffs. When laced, the puff is more likely to be bagged in the middle. A loose foot allows the sail to adapt its surface more readily to the impulses of the wind, while a laced sail is rigid along the foot. Further, the vertical bagging of a sail is reduced by allowing play to the foot, and there is less back sail at the clew. The surface is more effective. In hard boats of the beamy style, so much sail can be carried that the small advantage of a loose foot need not be considered. In sensitive boots, whose sail power is limited, and which must be utilized to the utmost, experience seems to point to positive advantage in the loose foot. Laced sails were tried in English waters after the advent of America, but have again been discarded. Apart from all this there are solid reasons for a loose foot from the sailorizing standpoint. You are always able to control the sit of the sail by a pull or slacking on the outhaul. In light winds a sail should not sit too flat, and a cutter mainsail gives you the choice. For a hasty reef to meet a squall the tack can be triced up and foresail lowered, reducing canvas to one-half in an instant. For knocking about, for half speed when trolling or fishing and for making a crowded roadstead, tricing up the tack is a useful and handy arrangement. For sea work in a small boat, it prevents a weight of water lodging in the sail when boarded or sailing wide. For racing in beamy boats, a loose foot may be of no special benefit, though that is a question subject to more thorough experiment, but for general purposes the loose foot is a useful and convenient arrangement for any boat Heavy lower sails have been tried on many yachts in recent years with acknowledged benefit to speed in light winds, and the practice will no doubt become general. This is one of the many minor improvements for which we have to thank the "cutter agitation."]

PATRIOTISM WITH A PATENT TO THE RESCUE.

Editor Forest and Stream:

I have read the FOREST AND STREAM with pleasure and profit almost from its first issue, and I have long ago learned to respect its opinions upon its specialty, the rod and gun.

In your issue of Jan. 31 appears an article entitled "No Money for Revolutions," upon which I am sorry to join issue with you. It contains so much error and ignorance that I am constrained to violate an almost inflexible rule of my life in an attempt to set you right. This effort, however, may be considered a work of supererogation, in view of the fact that the adverse opinions of a journal devoted to the dissemination of knowledge on fishing and gunning will not have much weight among sensible men, when compared with the favorable opinions which have been expressed by such standard technical authorities as the London *Engineer* and *Scientific American*. You evidently know nothing about scientific naval architecture, and, therefore, you are wholly disqualified to write upon the subject of the important invention of Captain Lundborg for improvements in steamships, which are based entirely upon such principles.

I have known Captain Lundborg intimately for nearly two years. He is a man of the highest attainments in his profession as a scientific naval architect. His inventions are the result of many years of scientific research, aided by long experience in practical seamanship and by innumerable tank experiments upon the system of the late Professor Froude. I have submitted the drawings, designs, models and mathematical calculations of the Lundborg ship to the ablest shipbuilders and scientific naval architects of this country for their examination and criticism, all of whom concur in the opinion that the invention is important and of great public utility; and that a ship constructed upon his model will insure greater speed, greater safety, greater carrying capacity and greater comfort to passengers than has hitherto been given to the traveling public.

I have confidence in the judgment of those persons who have examined and approved of the invention, for the reason that they are competent to judge of its merits and their judgment is unprejudiced. Captain Lundborg courts and challenges the most searching investigation, and he invites intelligent criticism from all persons who are qualified and competent to treat upon the subject. I realize the difficulty in making innovations upon an old order of things. All the old fogies in creation claim the right to cry out against inventors, notwithstanding the fact that by their genius and energy they have revolutionized the industries of the world. I recollect very distinctly when Captain Ericsson came to this country with his invention for war ships, and attempted to induce our government to utilize it for the public good in preserving the union, all the fools and cranks in Christendom decried and ridiculed the proposition much after the tone and spirit of your article on Captain Lundborg, and after repeated failures to induce the government to adopt his invention, some patriotic citizens of Boston aided and encouraged him in the construction of the Monitor, which saved the nation and revolutionized the navies of the world—a fact recently acknowledged and testified to in terms of eulogium by an honorable Senator upon the floor of the American Senate. Captain Lundborg is a countryman of Ericsson's, educated in the same scientific schools in Europe, a man of genius and ability, and I am impressed with the belief that your criticism upon his invention is as unwise and unjust as were the foolish and crazy strictures upon Captain Ericsson and his invention, when he first attempted to introduce it in this country. I believe that the Lundborg invention will effect a greater revolution in the merchant marine than did Captain Ericsson's in the navies of the world, and if it can be utilized toward the restoration of the American flag upon the ocean, for regaining to American citizens their share of the ocean carrying trade, and to give to them an equal chance in the proceeds of a business amounting to over $200,000,000 a year, which is now wholly monopolized by aliens, I think it is worthy of a fair trial, even at the public expense, and upon that issue, assuming that you are a true American, your encouragement and support will not be wanting.

This letter is running to much greater length than I had intended,

and in conclusion permit me to make a few corrections of the many misstatements contained in your article.

Captain Lundborg is not "attached to the Swedish Legation." He is a retired officer of the Swedish navy.

He is not "a petitioner for national alms," as you assert, which his memorial, herewith inclosed, will prove.

He has never offered his invention to any parties, much less "hawked it about for several years." And he now simply invites the attention of the American people to the importance of his discoveries and inventions, in the hope that they may be utilized for the public good.

Captain Lundborg is not "an alien," as you allege, he is a naturalized American citizen, filled with patriotic motive, and impressed with the conviction that among the pressing needs of his adopted country are an efficient navy, and an adequate merchant marine, to secure which, he is ready and willing to labor to the best of his ability. Are you good enough an American to help in this noble work?

WASHINGTON D. C. J. H. SYPHER.

[Mr Sypher has not kept the run of events or he would hardly question the "good authority" of this journal on matters of naval design. His adverse estimate we pass over as not worth notice, because incapable of offering an opinion on affairs he knows nothing of. We suspect his letter is an effort to advertise a venture in which he is interested as a lobbyist, another canal scheme from the Mississippi to the Gulf, with a liberal profit to the promoters. It is very kind that any one should wish to revive the skeleton of our commercial marine by a patent. But we do not care to have the government funds diverted to assisting half-hatched patent specifications. We trust our remarks will aid in closing the doors of the Treasury tight to any raid in the interests of private persons. The notion that the Lumborg ship can have any influence upon the destiny of our merchant marine is silly. The notion that it will build up an efficient navy which is purely a question of congressional appropriations, is even more ridiculous. We credit Captain Lundborg with much better sense. Our maritime interests should be revived upon common sense business principles and not by spread-eagle declamation or governmental pap. It is not a difficult problem to solve. It is a simple piece of arithmetic. Buy ships where you can get them cheapest, sail them with no greater restrictions than foreigners; and that is all there is to it. If we have to pay higher wages to officers and crew, the difference will be offset by the well-known tact, energy and adaptability of the American. Wipe out at one stroke the cormorants and hordes of officials with their fees, fines and dues, exorbitant and intricate charges, and half the reform is accomplished. Buy your implement of trade in the cheapest market; and the other half is achieved. If capital is too dear, if it finds more lucrative employment on shore, nothing under the sun can help us. We must be content to twirl our thumbs till a day when the economic conditions on this side of the Atlantic will be favorable enough to give us a chance in the race. Why Captain Lundborg's appeal to Congress is out of order is noted elsewhere.]

THE CORINTHIAN CLUB.

Editor Forest and Stream:

It was not exactly the time of year that any one would have thought of organizing a yacht club, for the snow lay thick and white outside the greenhouse windows, and the wild Channel waves rushed up and spattered over cosy little Sea Cliff, at Bangor, Belfast Lough, Ireland. The den was pretty full for all that. Arthur, secretary of the Royal Ulster Y. C., one of the mighty men who go down to the sea in ships, was doubled up in a wicker chair, while her ladyship, one of the best whips ever held tiller and made a boat do just what she could, was perched on an old chair which had descended from her great grandparents. John, most practical of all architects, was hidden behind a cloud of smoke, and Ally, just back from America, did his best to help out harmony with a long cigar. The boats were all laid up in winter quarters; but they were present on the wall in photographs, in spar drafts and in models, while along the bookcase was a long line of gracefully-draped winning flags, fourteen in number, which marked the prowess of the yawl Glide. We had had a pleasant season's sailing, though in those waters the summer starts late and is soon over, and this winter evening all were gathered around, chatting about the past. Then somebody suggested we should institute a practical Corinthian club, and we did. The club has lasted, taking in new members and doing its work thoroughly and well, year after year, until it commands almost as much interest as its chartered brother, the Royal Ulster.

Every one knows what a "Corinthian" club is, but even in such organizations as the Seawanhaka of New York, there is a good deal of work done for and not by the amateur, while the chief feature of the Bangor Club is that its members shall do all their sailing work, and at any rate, know how to attend when required to the rigging. Every one who joins (ladies are eligible for membership as well as the sterner sex) is balloted in, and thereby entitled to the honorable position of "boy." Boys may second candidates, vote at general or special meetings, form part of a crew, but may not own or steer a boat in a club race. The "boy" remains such until he has learned enough practical seamanship to answer correctly every one of the following questions:

1. Make a sheet bend.
2. Make an anchor bend.
3. Make a rolling hitch.
4. Make a blackwall hitch.
5. Make a timber hitch.
6. Make a clove hitch.
7. Make two half hitches on a belaying pin.
8. Make a reef knot.
9. Make a bowline.
10. Make a cat's paw.
11. Make a short and long splice.
12. Make an eye splice.
13. Put a whipping on the end of a rope.
14. Belay a sheet on a half pin.
15. Sheepshank a rope.
16. Name the standing and running rigging in a sloop, cutter and schooner.

This examination must be passed practically, the work being done with ropesends in presence of the examiner. The "boy" then takes rank as "ordinary seaman."

In the early days of the club, Sea Cliff was fairly populated with boys and girls educating one another how to splice and go through the seaman's manual.

An "ordinary seaman" receives a plain paper certificate to that effect, and is entitled to steer a boat but cannot own one. When he has passed for A. B., having fulfilled the following questions, he can propose a member, own a boat, and is eligible for election as a committee-man. He must have conquered the questions 1 to 16, and also the following:

17. Make a studdingsail bend.
18. Make a running bowline.
19. Make a bowline on a bight.
20. Make a grummet.
21. Make a Turk's head.
22. Make a double wall and double crown.
23. Herringbone a split sail.
24. Name the points of the compass.
25. State the rule of the road.
26. What are the different fog signals?
27. What lights are carried by vessels?
28. Describe the method of restoring apparently drowned persons.
29. How would you note the position of an anchor or moorings in case you had to slip?
30. How can oil be used in broken water to save the sea breaking aboard of a boat?

Next in order comes the star to the certificate, which is given when the yachtsman has further satisfied the examiner on the following, this examination being had in a boat under way:

31. Set sails and get under way from moorings.
32. Gybe.
33. Reef.
34. What would be done in case of a sudden squall, the direction being stated by the examiner?
35. Make a floating or sea anchor.
36. Bend a rope to an anchor so that you can clear it should it catch in rocks.

The examiner should also test applicant as to what he would do if halliards or gear carry away.

An "A. B." with a star is entitled to a parchment certificate, and may present himself for further examination for mate's papers, after which he is eligible for election as a flag officer of the club. During last year the club raced nearly every Saturday afternoon, and as many as twelve boats were entered at one time, there seldom being less than five. The boats were measured as follows: Multiply the sail area by the length of loadline, and divide by 4,000, the quotient to be "sail tonnage," one-fifth of overhang to be added to length of loadline. The scale for time allowance was the ordinary Y. R. A. table. In the case of peculiarly constructed boats the carpenter was authorized to report to the committee, who had power to award special certificates of measurement. Every boat and her gear were necessarily the property of members of the club. Every boat in a race was obliged to carry a life-buoy. Five minutes before the start the blue Peter was hoisted and gun fired, after which the boats were considered under the rules. At the expiration of five minutes the blue Peter was hauled down and the starting gun fired. Any boat across the line before that gun was sent back by showing her number from the battery. The following are the rules of the road:

"A boat which is running free shall keep out of the way of a boat which is close-hauled.

"A boat which is close-hauled on the port tack shall keep out of the way of a boat which is close-hauled on the starboard tack.

"When both are running free with the wind on different sides, the boat which has the wind on the port side shall keep out of the way of the other.

"When both are running free with the wind on the same side, the boat which is to windward shall keep out of the way of the boat which is to leeward.

"A boat which has the wind aft shall keep out of the way of boats on the wind."

Each boat to go fairly round the course and not to touch any flag-boat. A question arose in one race where a boat put her nose over the winning line, and having done so fouled the flag-boat. She claimed the race and, after consultation with the yachting authorities of Great Britain, it was decided that the instant the end of her bowsprit crossed the line she must be held to have completed her course: that the race was over, and that no subsequent fouling, on her part, could deprive her of the prize. After this decision provision will, probably, be made to prevent a recurrence of such an incident. Only sailing is allowed. A boat might anchor during a race, but must weigh anchor and not slip. In case of an accident or assistance rendered by a racing boat, if the committees deem that such a boat was prevented from winning a race, they have power to order a resail between the boats so prevented and the actual winner. Protests had to be filed within an hour after the arrival at the finish.

Such are some of the leading rules and regulations of the Bangor Corinthian Sailing Club. They are the result of considerable study by competent authorities, and ought to be useful as precedents, particularly at this time when Corinthian yacht clubs are becoming so popular both on the sea coast and the lakes of America.

BANGORIAN.

[Practical seamanship and competitive interest among the owners and sailers of small boats would be greatly benefited by the establishment of similar clubs in American waters. Pride and emulation in the race for the highest certificate would lead to study and proficiency in practice. To be an A. B., or eligible to a flag officer's berth in a club, founded upon an aristocracy of learning and experience, would not fail to receive proper recognition. The public would quickly bestow its approval and support to a club in which brains rank ahead of wealth, no matter how small the tonnage of the boats. To sport a flag which is a trade mark of capacity in yachting attainments has a meaning and dignity which commands respect for merit from all sides, and though flown from a two-tonner only, outranks the empty emblem of a "society leader" aboard a huge white elephant, or a picnicking dawdler afraid of an occasional wet jacket.]

THE PROPOSED ASSOCIATION.—Commenting upon the proposition to form a national association in America, *Le Yacht*, of Paris, remarks: "Certainly the programme of FOREST AND STREAM is an excellent one, the realization of which would be of wide utility; unfortunately, we think it will for a long time remain in the realm of Utopia in the United States, no matter how great progress yachting may have made in that country. First, there is a material obstacle which will interpose against the establishment of a central society. This is the distance between the clubs, extending along the immense length of the coasts of America. Besides the local conditions which influence the form and nature of construction will hinder the adoption of a common rule of measurement. In England, where yachting has prospered more than half a century, where the race courses are found over a relatively confined coast compared to that of the United States, the Y. R. A. has been able to establish, after a fashion, almost general uniformity of its rules, because the conditions surrounding construction are almost the same everywhere. But we cannot hope to see this uniformity in the United States, where so much difference exists in the boats, and where every club claims its own rules the best. For example, in the single city of New York the two largest clubs, the New York Y. C. and the Seawanhaka Corinthian Y. C., cannot agree on the application of a system of measurement by length and sail area combined, although they both accept the same principles in their rules. Nevertheless the proposition of FOREST AND STREAM will recommend itself to all sincere friends of yachting, who can draw from it great profit. The questions which it puts merit and challenge attention, and for that reason we have thought its proposition worth discussing."

A VARIED EXPERIENCE.—Marine Architect Saefkow, of the Imperal German Navy, writes us that in the past ten years he has designed and built for his own use fourteen yachts of all kinds, from the widest centerboard to the narrowest of cutters. One of his last designs was the cutter Rhe, 30ft. loadline, 9ft. beam and 5ft. draft, with 8,000 pounds on the keel. She sailed from the city of Kiel to Konigsberg on the Baltic, a distance of 400 miles, passing through a severe gale in comfort and safety. She is notably fast in light winds, being more than a match for the best centerboards of local renown. The five-beam cutter Anna, we are informed, is the driest boat of all. Lieut. Saefkow ever sailed, and as "quiet as a girl" in a sea, no one being seasick on board in heavy weather, as was always the case with the wide boats he owned. The Anna is a great success, and will appear in the English races next summer. Lieut. Saefkow has constructed the curve of stability for a sandbagger like the New York Parole, and found she attained her maximum at twenty-seven degrees, and her vanishing point at sixty.

THE JANUARY NUMBER.—The London *Nautical Magazine* for January has reached us, freighted as usual with instruction and interest to sea-going people. The contents for this month include "The Stability of Merchant Ships," "Insubordination of Seamen," and "The Panama Canal," a timely article for all Americans to read. While we are fully dreaming of cutting across Nicaragua and indulging in threatening bluster about our rights and prestige in the case, foreigners have gone to work with energy and capital, and in spite of all difficulties, the Panama canal will become an accomplished fact before we finish blowing off laudable but futile patriotic steam. The magazine also contains the usual notes on navigation, correspondence from ship masters and similar matter, which is the only literature the handful of American seamen can reach in the total absence of any nautical periodical of our own.

REAL YACHTING.—A gentleman writes from Liverpool, England, that he has bought a regular "nailer" in Southampton, and expects to sail her round to her new hailing port in February. She is 31ft. 6in. over all, 26ft. 6in. loadline, and 6ft. 6in. beam, with 5ft. 6in. draft, and flush deck. Forecastle with cot for one hand, main cabin with sofas, and after cabin with two standing berths, washstand, etc. Polished pine cabins and teak deck fittings. This cutter is nearly same loadline as the little Yolande lying in Seawanhaka Basin, Staten Island, with 6in. less beam. The voyage round the Land's End to Liverpool is six hundred miles. Englishmen think nothing of such ventures, but here a man's soundness of mind is still questioned in many quarters if he moots going to sea in a big schooner, or has ambitions which take him beyond the confines of one day's run in the Sound.

CRUISE OF THE FALCON.—Sampson, Low & Co., of London, have published a new yachting volume in which is detailed the cruise of the little yawl Falcon, from Southampton to the coast of Brazil and the South Atlantic, made by the owner, Mr. Knight, and two friends as the amateur crew. The Falcon is only 42ft. long, yet the extensive voyage was accomplished in safety and comfort and hugely enjoyed. The volume is full of instruction, useful to the mercantile service, as many unchartered ports and islands were visited and notes made upon their hydrography, best approaches, etc. The owner left the yacht at Barbadoes, intending soon to return and continue the voyage through the West Indies and home. We may recur to this volume at greater length when chance offers. It is commended to those in search of real yachting without the expense attached to "luxuriant" palaces afloat.

DETROIT'S FLEET.—The sloop yacht Petrel, built in July, 1883, at Chicago, and brought through the great lakes to Detroit, has been purchased at the latter place by Messrs. Aug. Marxhausen, Jr., W. F. Baisch, H. Kees and George Boehnlein, for the sum of $300. She is a cabin yacht of fine lines, being 37ft. over all, and having a beam of 10ft. 3in., deep draft, and carries five sails, viz., main, top, and storm staysails, jib and flying jib. Although she is not rigged for racing, having been used for cruising only, her owners intend entering her in all regattas and private races which may take place on the lakes. Yachting has been very quiet in and around Detroit, but through the efforts of these and other gentlemen there will be quite a boom in it this season.

BIG CUTTERS.—The prospect for some live racing in the 80-ton class in English waters is exceedingly good. Fay & Co., of Southampton, are building two new flyers of about 85 tons, from lines by Mr. Joseph M. Soper, the superintendent of the yard. They are also overhauling the Erycina of 90 tons, in view of the coming contest. Mr. Soper is the designer of many fine vessels. The Daisy, soon to be in our waters, is from his hands. The same builders have underway some new cutters to sail in the length and sail area classes in Southampton waters. One of these will be much like the Daisy, 25x8x6½ft. and 35ft. over all, with a Buttercup stem.

KNICKERBOCKER Y. C.—Officers for the years: Commodore, Geo. R. Hobby; Vice-Com., W. T. Onderdonk; Secretary, William R. Morse; Treasurer, Chas. Lamb; Measurer, John Hyslop. Spring match fixed for May 30, open to five classes. Sixty-five yachts in the fleet, and 130 members. The lectures delivered before the club by Mr. Hyslop have been well attended and appreciated. They have so far covered the methods of designing boats, and others are promised detailing the planning of rigs and Mr. Hyslop's original wave area experiments which antedate the investigations of Collin Archer in Europe.

NEW YORK Y. C.—Annual matches fixed for June 12. Mr. Ogden Goelet, Norseman schooner, has offered two cups, value $1,000 and $500, for schooners and sloops and cutters to be sailed for off Newport next season. Officers of the club for the year: Commodore, James Gordon Bennett, Namouna steamer; Vice-Commodore, W. P. Douglas, Arrow cutter and Aida steamer; Rear-Commodore, Samuel R. Platt, Montauk schooner; Secretary, Chas. A. Minton; Treasurer, Jas. O. Proudfit; Measurer, John M. Wilson; Racing Committee, J. Fred. Tams, Chas. H. Stebbins and Jules A. Montant.

RIGHT MOVE.—It is but a very short time since that any one counselling outside cruising and racing was considered more or less demented. People have learned better by this time. Extended cruises are the order of the day, and a yacht not fit for such work no longer ranks high in esteem. The New Haven Yacht Club, though starting in life as a local Sound organization, are up to the enterprise of the day and propose an ocean match from club-house around Block Island and home. The Sound is fast loosing its mesmeric hold upon progressive men.

THE LOWELL CUTTER.—A cutter yacht which Williams & Stevens, of Lowell, are building is about half planked. Her bilge is straight from rabbet to bilge of garboard, and the dimensions are as follows: Length over all, 25ft. 6in.; loadline, 20ft. 6in; 6ft. moulded beam; depth of middle section, 5ft. 3in.; draft, 4ft. 11in. There is a small cockpit on deck, and a wash board on the outside. The cabin has two berths and room for a hammock, and there are lockers, water tanks, etc. The cutter will readily find an owner.—*Boston Herald.*

A GOOD EXAMPLE.—Mr. Wm. Gardner has left for England to enter the Royal School of Naval Architecture and pass through a regular course of study, with the object of mastering the theory and practice of shipbuilding. Mr. Gardner has already been under the tuition of Mr. Harvey in this city, and has spent some time in the yard of John Roach & Son at Chester. He has voluntarily entered upon his self-education from, enthusiasm for the science, a worthy example for others of independent means to follow.

BOSTON Y. C.—The following fixtures have been settled upon: Regular club cruise every Saturday, returning Sunday, during the summer months. Also, May 24, review and cruise, commodore in charge. May 31—First club match. Connor and commodore's challenge cups and regular prizes. June 28—Ladies' day. July 12—Second club match for regular prizes. Aug. 9—Open match; entries from all clubs. Aug. 23—Third club match; regular prizes. Sept. 13—Second ladies' day.

"HUNT'S MAGAZINE."—This London publication for January contains a number of readable yachting cruises, the lines of a small 3-ton cutter, and general yachting notes. Published by Hunt & Co., 119 Church street, London. Subscription $1a year.

CRUISING.—Schooner Gitana, W. F. Weld, Jr., arrived off Gibraltar Rock, Feb. 4, and the Dauntless, C. H. Colt, was heard from about the same time at St. Michael, Azore Islands. It is expected they will race in the great Nice International.

PHOTOS.—We have received from a gentleman in England, some handsome photos of the crack schooner Miranda, the cutter Silver Star, and the tiny three-ton Chittywee, all under way in live breezes.

IMPORTED FROM THE EAST.—Several gentlemen of Brooklyn have bought a cutter 32ft. loadline from Mr. Decator, of Portsmouth. This boat will appear in New York waters early in spring.

SAIL AREA.—In the table of elements of small cruiser last week, the area of sail per sq. ft. of wet surface should read 2.45sq. ft., including surface of rudder, or 2.60sq. ft. without it.

NEW ENGLAND YACHTING ASSOCIATION—Has been organized and will hold next meeting Feb. 20, Parker House, Boston. Report of proceedings next week.

ENGLISH AND AMERICAN YACHTS.—The introductory to an article under this head by Dixon Kemp, appears in the London *Shipping World* for January.

ILEEN.—We are able to state that so far as the Ileen is concerned there is no foundation for the rumors of a proposed race with the Hildegard.

HULL Y. C.—Will hold meetings each second Saturday in June, July, August and September.

FORTUNA—Left St. Thomas Feb. 3, bound for St. Croix.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

A. J. H., Pontiac, Mich.—Try Glover's mange cure.

R. M., Youngstown, O.—Write to Gen. F. A. Bond, Jessup, Md.

F. G. B., Boston, Mass.—We know of no well-bred retriever for sale.

HUDSON, Hudson, N. Y.—Write to Dr. M. H. Cryer, 1,111 Girard street, Philadelphia, Pa.

ACCOMAC.—A mixture for whitening sails was given in FOREST AND STREAM Sept. 13, 1883. No preparation will prevent mildew, unless the sail is well cared for.

SNOW SHOES, Dunbarton, N. H.—For snow shoes write to John Henderson & Co., Montreal, or to Renfrew & Co., Quebec. Describe to them the style you want.

F. M. L., Summit Station, Ohio.—1. The rifle will be ready about March 1. 2. For descriptions of the other arms named send for catalogue to the manufacturers of them, who advertise in our columns.

C. B. T.—Are split-bamboo rods worth the price asked for them as compared with the best wooden rods? Ans. Split-bamboo rods are, like wooden ones, of all degrees of excellence. The best wooden rods are nearly as expensive as the bamboo. We think that a good rod of split bamboo is well worth the price usually asked.

NIGHT HAWK, St. Paul's School, Concord, N. H.—Will you have the kindness to tell me where I can get a pair of live grouse of any kind, ruffed especially desired? Ans. We think it very doubtful if you can obtain them. Once in a while Reiche Bros., of Chatham street, New York, have them. Possibly some of our correspondents may be able to help you.

J. W. L., Gildersleeve, Conn.—Will you tell us about the habits of the great Northern hare? 1. Do they frequent hilly or swampy localities? 2. What kind of woods do they prefer to live in? 3. How fast do they breed young, and how many at a litter? Ans. 1. Are usually found in dense swamps, though sometimes among the thick pine woods on the hills. 2. Cedar, hemlock and pine. 3. Probably breeds twice a year, having from four to six young at a litter.

H. B. Glasco, N. Y.—Several days ago, a boy brought to me, for mounting, an owl which I have never seen before. In size it is between the screech owl and barred owl. Wings long and pointed, breast and stomach buff, with dark brown or black markings, feathers on legs and feet buff, claws black; under surface of wings nearly the same, except the points which are black; back, wings, and tail dark buff, with dark brown or black bars, beak black, eyes yellow, pupil blue black. What is it? Ans. Very likely a short-eared owl (*Asio accipitrinus*).

B. H., Norman Co., Minn.—1. What baits are best for pickerel, pike, rock bass, sun bass, redhorse, whitefish and catfish? 2. Can any of these be taken with the artificial fly, and if so, what kinds? There are no angle worms in this part. Ans. 1. Small fish are best for all the fish named except whitefish and redhorse. The whitefish does not often take bait, and the redhorse is one of the sucker family and can be taken with small strips of tough beef cut in the shape of worms. Pickerel and pike can be taken with revolving spoons. 3. Bass can be taken with the fly. Write to any of our advertisers for an assortment of good bass flies.

TO FLORIDA ANGLERS.

Keeping fully abreast with the times, we have the last few seasons given particular attention to the manufacture and introduction of a large variety of tackle specially adapted to the needs of Florida anglers. The difficulty of obtaining natural bait at some of the best fishing grounds renders it very desirable for anglers to provide themselves with proper artificial baits. We have an unusually fine assortment of the following goods, used and recommended by expert Florida anglers:

Pearl Florida Spinners, Mottled Pearl Spoons, Pearl Squids, Pearl Mullet, Florida Bass Flies, Tackle for Channel Bass, Red Snappers, Sheepshead, Salt Water Trout, Etc., Etc. Also a New and Special Hook for Tarpum.

ABBEY & IMBRIE,

48 and 50 Maiden Lane, New York City.

JAS. F. MARSTERS,

55 Court Street, Brooklyn.

MANUFACTURER AND DEALER OF

Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., $1.00; 120ft., $1.25; 180ft., $1.50; 240ft., $1.75; 300ft., $2.00; 450ft., $2.25; 600ft., $2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeeen, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders. 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft long, $1.50 to $10.00. Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

CHEAP TRAP SHOOTING.

—)o(—

Belcher's Pat. Paper Bird.

Attached to a suitable wire ball, thrown from any glass ball trap in the same way as glass balls, is the cheapest and most satisfactory trap shooting. These birds may be re-used after marking the shot perforations with pencil. No disputes whether a bird is hit or missed; no broken glass or clay to injure grounds. Balls everlasting. Fifty birds and one ball sent by mail on receipt of $1. Additional birds $1 per hundred. Additional balls 50 cents each.

Address,

G. F. KOLB, 732 Sansom Street, Philadelphia, Pa.

WARNING!

—)o(—

Buy or use no Clay Pigeons or Clay Pigeon Traps excepting those made or licensed by

The Ligowsky Clay Pigeon Co., Cincinnati, O.

This company owns the original patents on "Clay Pigeons" and "Clay Pigeon" Traps. Others are manufacturing in infringement of these patents; and all who use or sell such infringing Clay Pigeons or Clay Pigeon Traps will be prosecuted. The Ligowsky Clay Pigeon Co. furnishes traps at $7.00, with all the latest improvements and guaranteed against any liability for infringement.

Send for circulars of the 5-days programme of the First International Clay Pigeon Tournament, Chicago, May 26 to 31. Over $5,000 in prizes and sweepstakes.

READY NEXT MONDAY.

Antelope and Deer of America.

—BY—

Hon. J. D. CATON.

A New Edition of this important work will be published February 18th.

This volume is one which should be in the hands of every deer hunter. It gives the complete natural history of the antelope and all the species of North American deer, with full instructions as to how to hunt them. Its value to the practical hunter and to the beginner cannot be overestimated.

425 pages and many illustrations. Price $2.50.

Forest and Stream Publishing Co., 39 Park Row, N. Y.

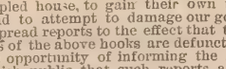
A Skin of Beauty is a joy Forever.
DR T. FELIX GOURAUD'S
Oriental Cream, or Magical Beautifier

PURIFIES as well as Beautifies the Skin.

Removes Tan, Pimples, Freckles, Moth Patches and every blemish on beauty, and defies detection. It has stood the test of thirty years, and it is so harmless we taste it to be sure the preparation is properly made. Accept no counterfeit of similar name. The distinguished Dr. L. A. Sayre said to a lady of the *haut ton* (a patient):—"*As you ladies will use them, I recommend 'Gouraud's Cream' as the least harmful of all the skin preparations.*" One bottle will last six months, using it every day. Also Gouraud's Subtile removes superfluous hair without injury to the skin.



MME. M. B. T. GOURAUD, Sole Proprietor,
48 Bond street, N. Y.

For sale by all Druggists and Fancy Goods dealers throughout the U. S., Canadas and Europe. Also found in N. Y. City, at R. H. Macy's, Stern's, Ehrich's, Kidley's, and other Fancy Goods Dealers. ☞Beware of base imitations. $1,000 reward for arrest and proof of any one selling the same.

Harrison's Celebrated Fish Hook.
Registered.

Trade  Mark.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and **we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours,** which are to be obtained from the most respectable wholesale houses in the trade.

Signed, **R. HARRISON, BARTLEET & CO.,**
Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England. (December, 1882.)

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

39 Park Row, New York.

A FEW WILD HARES FOR SALE (*Lepus americanus*) to stock game preserves. Please address J. G. RICH, Bethel, Me. jan10,2mo

TO EXCHANGE.—10-OUNCE BAMBOO FLY-rod, nickel mounted, extra tip, perfect order, for cocker spaniel puppy. F. W. KITCHEL, Perth Amboy, N. J. feb14,1t

FOR SALE.—SEALSKIN VEST, FINE QUALITY, new; 38in. chest; $18, or will exchange for double barrel shotgun or magazine rifle. Address C. ANDREWS, Box 79, West Point, N. Y. feb14,1t

FOR SALE.—A LOT OF BROOK TROUT FRY at $3 per 1000. Also 1, 2 and 3-year old trout for sale East Randolph Trout Pond, Cattaraugus County, N. Y. M. V. MOSHIER, Prop. feb14,6t

WILL EXCHANGE.—DEXTER SCROLL SAW for pointer pup, over 4 mos. old. W. MACKAY, Englewood, N. J. feb14,1t

FOR SALE.—8-BORE, 11-LBS. DOUBLE GUN (Scott's make); cost new $225; is in fine condition and a grand gun for heavy shooting; full set of loading tools and fifty brass shells. Price very low. Also Sharps .50-cal. rifle; splendid gun for deer. Lock Box 237 Suspension, Bridge, N. Y. feb14,1t

FOR SALE.—SHARPS LONG-RANGE AND hunting rifle, good as new, pistol grip, finely finished, .45-cal., chambered for 2¼ shell for 100 to 115grs. powder; also set reloading tools and resizing die, shells, patched bullets, etc. W. E. HOFMAN, Cheyenne, Wyoming. feb14,2t

FOR SALE.
Parker gun, 10-bore, 10lbs., top action, pistol grip Damascus barrels, rubber butt plate, etc. All improvements; made to order; warranted. In perfect order. Cost $95; will sell for $55. Address Box 223, Newton Centre, Mass. jan31,2t

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, FEBRUARY 21, 1884.

VOL. XXII.—No. 4. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

UNIFORM GAME LAWS.

THIS is a very old topic. Possibly it may be considered hackneyed. To suggest anything new in relation to it is quite impossible. We are assured, however, that the subject is not one to be put aside and lost sight of. It has been often discussed. It ought to be discussed more. We are making progress in the field of game legislation. The country is too large for a uniform game law applying to its entire extent. To talk of a national law, prescribing the same season for Maine and Florida, is folly. But it is highly desirable, and we have faith to believe that it may some time be entirely practicable, to secure uniform laws for contiguous States which lie in the same isothermal belts. Such laws would be based on the soundest common sense.

The one obstacle in the way of securing such a system is the wide and almost hopelessly irreconcilable differences of opinion prevailing among sportsmen respecting the proper seasons for killing and not killing game. In each individual State this diversity of sentiment is strongly marked, and so aggressive that it stands in the way of enacting laws that would secure the greatest good to the greatest number.

There is one point, however, upon which all might agree: That is the season for marketing game. If the sportsmen of New York, New Jersey and Pennsylvania cannot agree upon an uniform open season for game killing they might agree upon the date when game selling should be stopped by law. This agreement might extend further than this. Why should not Massachusetts and New York and Pennsylvania regulate their game-selling seasons by an uniform law, which should have contol of the game of these three States and the game of the West as well? Why should not the game market regulations of Illinois be identical with those of Michigan, Wisconsin and Minnesota?

The right way to secure such laws is to unite for action. A national association for such a purpose has been tried. It was too big. It fell to pieces. If another one be organized that too will fall to pieces. What is needed is the association together of a restricted number of States. Such a meeting was held in Boston the other day. The New England States were represented. The interests of the several sections were identical. A law was drafted, which will be presented to the legislatures of the several States. A uniform law for New England will be a great step in advance.

FOOLISHNESS IN THE WOODS.

FOREST lands. The lumberman's axe. One tree cut for lumber. Twenty others destroyed in getting the one out. The ground littered up with brush. Fire. Desolation. That is the way our forests in this country have gone and are going. And that is the way they will go unless some wise and sufficient action be taken to call a halt in the work of destruction. The New York Legislature is asked to provide a remedy for the vandalism of Adirondack forest destroyers. The welfare of the whole nation is directly concerned in this issue. The members of the Senate and Assembly at Albany cannot afford to shirk the responsibility of providing some measure to avert the calamities which will most surely follow if the present system of forest waste is persisted in.

THE FIGHT IN NEW ENGLAND.

A SPECIAL meeting of the Boston Produce Exchange was called on Monday, and resolutions were passed protesting against the proposed alterations in the game laws of Massachusetts. A committee of five was appointed to take measures to protect the interests of the marketmen as against the ideas of those who would so adjust the present statutes as to prevent the possession and exposure for sale of game and game birds when out of season in this and other States. The present law permits the sale of frozen quail, prairie chickens and deer after the close time in that and the other New England States, as well as the West. What has been the result? Simply that the Boston market has become noted as the dumping ground of game out of season. It is the shutting off in this traffic which the Boston marketmen fear, and it is here that the fight will begin, for "there is going to be a fight." The marketmen resolved to oppose "any change in the law by all proper means," which means to raise thousands of dollars and employ able counsel to fight their case before the Legislature now in session.

The marketmen say that it is a fight between kid-gloved sportsmen and business men; that a great business interest will be sacrificed, if the proposed game law passes, to the whims of an association of dandy sportsmen—meaning the Massachusetts Fish and Game Protective Association—"a crowd of swell-front and swallow-tail wine guzzlers, who want all the game protected by law for their own private shooting." Such is about the size the Boston marketmen give the question of uniform game laws throughout New England, as proposed by the late convention of Fish and Game Commissioners from six New England States lately held in that city.

But these marketmen have counted without their host this time. They suppose that they are crossing swords with the Massachusetts Fish and Game Association only, as on former occasions, when, in fact, they have got to fight a strongly-planted, fast-growing public sentiment, engrafted all over New England, for the better protection of the little there is left of fish and game. Perhaps they do not know, or at least would like to hide the fact, that their miserable traffic in game out of season has caused the true laborers for game protection more trouble than anything under the sun. Maine has been obliged to frame a non-exportation law to keep her fish and game out of the Boston market, even in close time. More than 1,500 deer went from that State last year to the Boston market—this year hardly fifty. But there are chances that the non-exportation law may be lost at the next session of its biennial Legislature in 1885, because of its non-popularity with market-hunters. This general law of close time and shutting of the Boston market to fish and game after close time will shut the doors to market-hunting just as firmly. The Boston marketmen see it. They see the end of grouse from Maine, purchased at 20 cents a piece and sold in close time at $2 per pair; the end of deer bought at 5 cents per pound and sold out after close time in saddles at 200 per cent. profit. This is "kid glove" against "business man." No matter how long the game lasts; there is more money in it for the marketman unprotected than protected.

"Kid gloves," Mr. Marketman, cover up too many claws for you this time. You have had your share. You have daunted frozen quail, prairie chickens and deer in the face of honest game protection till all New England is awakened and each State proposes to put a universal game law upon her statute books; and no back tracks will be taken to please fifty game dealers in Boston. "Kid gloves," as you call them, include some of the best business and professional men in Massachusetts, and such men as Augustus Hemmingway, Darius Forbes, Governor Robinson and Senator Bruce are backing up honest and earnest fish and game protection with their money and their influence. Such protection is the belief and nearest the hearts of the prime movers for the suppression of an open market for game in Boston, out of season everywhere else.

DEATH OF REUBEN WOOD.

The very sudden death of Mr. Reuben Wood on Saturday last was a shock to his many friends. He dropped dead of heart disease.

Widely known and as widely respected for his sterling honesty and simplicity, he was always the center of a party of anglers at the tournaments at which he had taken more prizes for his beautiful fly-casting than any other man. Mr. Wood was born in Greenbush, Rensselear county, N. Y., in 1822, and was therefore sixty-two years old. At an early age he moved to Syracuse, where he has since lived and been in business. He was a trustee of the First Baptist Church. He was president of the Onondaga Fishing Association, and a member of the Sumner Corps. He leaves a wife, and the children who survive him are Mrs. C. C. Francis, of Pittsfield, Mass.; George B. Wood, of Syracuse; Charles W. Wood, who is attending Williams College, and Miss Mabel L. Wood.

We have personally known Mr. Wood for over forty-five years, and both as schoolboy and man he bore the same open hearted, sympathetic disposition which has made him respected wherever he was known. Always enthusiastic on angling, he was particularly fond of trips to the Adirondacks, where he could enjoy wilderness life, and a short time ago he told us of his intended trip to Meacham Lake next May. Last year Mr. Wood was one of the staff of the American Commission to the International Fisheries Exhibition at London, in charge of the display of angling implements, and made many friends on the other side. His singularly open character and cheerfulness brought him friends everywhere, and "Uncle Reub.," as he was familiarly known, was very popular among all classes. Many will miss his kindly face at the tournaments and on the streams.

THE DOWEL QUESTION.

THE utility of dowels on the ferrules of fishing rods forms the subject of a very able article in another column, by Mr. Henry P. Wells. This is one of the live questions which should be fully and fairly discussed from both sides. That there is another side may be inferred from the fact that most rod makers use the dowels; and we would be glad to have those who believe in their utility give reasons for the faith that is in them. Mr. Wells insists that the dowel must go; that it is a relict of an old method of making jointed rods which once had a reason for existence, but that its day of usefulness is past and that it is now not only useless, but injurious to the strength of a rod. We commend the article by Mr. Wells to the careful consideration of both anglers and rod makers.

DOG TAX AND GAME LAW.

IN another column will be found a communication in which the writer proposes that the income derived from the tax on dogs should be devoted to the execution of the game laws. This is a very sensible suggestion. The plan includes the rigid enforcement of the dog law, and the collection of the dog tax. That means the weeding out (or drowning out) of the worthless curs; that, in turn, means that the sheep killers will be decimated. The sheep will not suffer; the sheep owner will have no claim for damages. The dog tax fund can then be utilized for game protection. Why should it not be?

No. 36.—The authorship of No. 36 has been determined. The several claimants who are busy writing postal cards and requesting that we forward the prize without delay, may therefore cease from their labors.

INTERNATIONAL MATCH CONDITIONS.

IT is pretty certain now that there will be no international rifle match during the present season. The old feud between the Amateur Rifle Club of this city and the small-bore men of Ireland seems to have died away. The Palma emblem of the small-bore long-range championship rests rustingly in the rooms of the Military Service Institution at Governor's Island, and with the defeat in July last of an American team at Wimbledon ended the series of two matches which the British Association had so cleverly arranged to catch the Americans on their weak point of long-range military shooting. There is, therefore, no match now on the slate, and there are no notes of preparation on either side the Atlantic. Thus far not a single official letter has passed on the subject of a match in 1884.

During the visit of Col. Howard to England last year there was some talk of a match in the following season. The American team captain had, however, no authority to make any arrangements for a contest beyond the one which he was sent over to conduct, and this fact was known generally. The English riflemen, elated by their success in downing the Americans, talked much of following up their victory by giving the Americans another lesson, and we believe that a sum of money toward the expenses of the team was either collected or guaranteed. The British Council, in whom alone the power exists to bind the Association, did nothing, nor did the American Directors take any step in the matter.

The seeming apathy of the Americans was in part due to the fact that there was a change of directors by the election of January, when the annual meeting of the Association was held, and the outgoing directors did not care to do anything which might bind the incoming board or leave them a legacy of work in the shape of a match. The new directors have not thus far thought it wise to take any steps toward starting a competition, and so the matter lies quiescent at a time when a brisk pushing of preparation would be the rule if there is to be a meeting of the British and American teams in 1884.

There is much diversity of opinion as to the expediency of having a match in any such frequency as to require the crossing of the Atlantic by a team each year. Some of the younger and more enthusiastic spirits are in favor of a fight with each recurring season, but the older heads among the managers are shaken cautiously, and the question asked why it is necessary to make the international match an annual occurrence. Each match entails a great deal of work and responsibility upon a few, and it is not always easy to raise the considerable sums of money needed equally, whether the competition is held on our own or foreign soil. There is no liberal fund from which to draw, no Government appropriation to be depended upon, and those who can shoot well, and whom it is proper to send to the front as representative marksmen, are not always able to pay their own way in addition to the loss of time which must be allowed in each individual case.

Apart from the financial aspect, it is doubtful whether there is much gain in the way of increased knowledge of firearms by having annual meetings. A defeat to be profitable needs to be studied. If the arms used were found inferior it would seem to be a sensible thing to take an off-year for the purpose of private practice and improvement, and even for the men it may be found necessary to devote a season to careful drill and record-making on the home ranges before a formal match is entered upon. There is no sensible reason why a match should not be made a biennial or even a triennial matter. There is no time lost, the science of small arms shooting goes on advancing just the same, and then a renewed zest is given the competitions when they do come off. Rifle manufacturers and those interested in the gate money which comes in connection with the matches, may seek to bring about annual gatherings and stir up the popular interest which comes with each international contest, but even these individuals may find that they have killed the goose which laid the golden egg if they push matters too far or too rapidly.

Just at present America may, with a good grace, seek to introduce the idea of matches at longer intervals. We have been defeated and naturally feel anxious for such return matches as shall enable us to demonstrate the fact that our present make of long-range military arms are fully equal to those of English make. That is the general conviction here, and with anything short of that execrable and super English weather which met the American team at Wimbledon in July, we think that the chances are more than even for a victory to our team. Under these circumstances our managers may very properly make such advances and suggest such steps to our English friends as shall give us a match of importance under certain definite conditions and occurring not more often than once in two years, and which shall then be regarded as the championship match in the style of shooting covered by the rules of the competition. Such a match we should be glad to see inaugurated, but against this annual infliction of spasmodic contests we wish a relief.

CHEAP QUAIL.—Quail is a favorite dish on New York bills of fare. Landladies of boarding houses serve quail for dinner because it is cheap. Dishonestly sold contraband quail is not so expensive as honestly bred barn yard capon. The game protector in this city is not smart enough to stop this unlawful game traffic.

The Sportsman Tourist.

THE LAND OF THE GOU-GOU.

A TRUE TALE.

"And from out the heavy fog gradually appeared the figure of a woman of beautiful form and majestic appearance, with long, flowing drapery extending indefinitely back into the dense sea mist. From her girdle hung a bag, and, stretching out her arms, she seized the rapacious fishermen, and, depositing them therein, slowly faded from view. And they told us it was the Gou-gou who frequented those coasts."—*Legend of the Micmacs.*

THE shores of the Gulf of St. Lawrence offer a great variety of scenery and many interesting geological formations. In parts bold, so bold in fact that in many places the common cables of the fishermen are unable to reach bottom close under the shore, and backed by high mountains; in other parts low with long sandy points running out into the sea, and with outlying banks of sand, affording breeding grounds for the cod, haddock and hake which love the clear cold waters and the abundant food of this region.

Centuries ago, ages before the hardy and adventurous fishermen from the channel islands had found their way to these waters, off one of the outermost points of the mainland, old ocean, under the influence of the wintry winds from the east, began throwing up a sandbank, which by slow accretions rose above the surface. Here a sparse vegetation sprang up, probably of the coarser beach grasses, and this, in the course of years, by growth and decay, formed a soil capable of nourishing some of the hardier scrubs sown by the winds from the mainland or deposited by the birds in their southern flights from the bleak barrens of Labrador. These again by their death furnished new life to still other plants, till finally the bare sandbank became covered with a vegetation, not luxuriant to be sure, but sufficient to change the yellow mat of sand into a green carpet; and eventually, by some of the many mysterious ways which nature adopts for such processes, trees sprang up in some places and covered large tracts with a forest of white and yellow birch, spruce and fir. In other parts, and those more directly exposed to the fierce gales of those latitudes, any extended growth of trees was impossible, and the annual deposits of each year only served to raise the island higher by a layer of peat, and the best efforts of nature only succeeded in planting here and there a few junipers which, exposed to the full force of the ocean blasts, were unable to attain more than a stunted and gnarled growth. The intervening spaces were, however, filled with abundance of scrubs and moss, whortleberry, blackberry, and a few other varieties of low bushes; the black bankberries, bake apples, upland cranberries; the dry, crisp gray moss so common in the haunts of the caribou, and which, more than any other one thing, is characteristic of the so-called caribou barrens of the Eastern States and Provinces; and finally the wet, green moss, such a favorite with the trout fisherman for filling his creel and thus keeping his fish fresh.

As the height of the island increased, a natural system of drainage was established, the loftier portions of the peat sank under the weight of snow and rain, and toward these low spots the drainage of the surrounding plain naturally gravitated till the water rose above the surface of vegetation with the result of destroying it, and thus increasing the depth of the pool, while at the same time the recurring seasons raised the general surface higher and higher, and increased the amount of refuse water, and the soft spot of peat at first converted into a bog-hole, became slowly a pond of considerable depth. Many of these ponds thus formed over the barrens at slightly variable heights by the laws of gravitation, sought communication with each other, and the trickling water wearing away the soil, established brooks or rather ditches, often through three or four ponds before the water finally reached its level. Some of these ponds, from their proximity to the sea, started their drainage in that direction with the result of forming brooks of perpetual flowing water. Again, in some of the larger ponds, a new factor appeared, for, exposed as they were to the winds from every direction, and with low banks affording no shelter, the action of their waves was sufficient often to tear away or at least undermine the banks, thus enlarging the water surface, and each increase in size still further favored the process of growth till in several places large lakes were formed.

The dry moss and the resinous scrubs furnished favorable tinder for a conflagration, and after man appeared upon the scene, fire began to play a not unimportant part in the development of our island, filling the peat with a layer of ashes which increased its solidity and enriched its soil, and to this agent, probably, more than anything else, is due the rich growth of berries of all kinds.

But while old gray-bearded Neptune was diligently shoveling the sand into a heap to get it out of water, even his long arms were insufficient to land each tridentful directly on top of the previous one, or it may be Boreas was loafing about and chaffing him, for, toward the sea, certain irregularities in the deposit existed, and when some of the fresh-water lakes began to drain toward the sea the water accumulated in some of the depressions just within the outer beach, forming again lakes of considerable size till their waters, rising more and more, found a path over the ridge and kissed the ocean. A short time now sufficed to wash away the soft sea sand and establish a brook, and at the next full moon the spring tide took up the work of excavation in the opposite direction, and the large fresh-water pond became brackish and began to rise and fall with the outer tides. A new soil thus introduced brought a new and different vegetation, and the brackish bay became filled with the succulent eel-grass in many places, while the action of the waves outside sent in with each high tide an abundance of sand which, being precipitated in the still water of the bay, formed in places low and bare sandbars and kept the depth of the whole bay shallow.

Imagine then an island composed of six to eight feet of peat resting on a sandbank with sloping sandy shores, the highest point not more than fifteen feet above high water. Several square miles of this covered with a dense forest composed largely of evergreens (*Abies* and *Larax*), but with a fair sprinkling of birches, the remainder of the island covered with a growth of low scrubs and vines and moss, and dotted with ponds of from six inches to as many feet in depth in every direction, the size of the ponds varying from a couple of rods to a mile in diameter; they number nearly two hundred. Their surfaces often covered with the leaves of the pond lily, their banks usually lined with the rich green moss raised but a few inches above the level of the water, and almost all of them having one or two small clumps of dwarf hackmatacks only a few feet high, and twisted by the winds into every conceivable shape. Add to this, miles upon miles of blueberries, whortleberries, bankberries, bake-apples, cranberries, and occasionally, blackberries. Remember the shallow bays of brackish water one to two miles in diameter filled with young short eel grass, the sandbars barely covered at high tide, the isolated situation, and is there any doubt what you will find there? What better place can the dusky duck find to rear her brood than the thick cluster of bushes on the edge of that little pond, whence as the wandering instinct is developed, they may find easy access to the next and larger pond through the connecting brook. As September approaches, can you not hear the cooing of that flock of dough-birds among the blueberries, and their whistle as they rise from sheer exuberance of spirits to circle about and again alight? Do you not notice the louder whistle of the jacks occasionally with the others? Would you not expect that the golden plover in leading its young from the northern wilderness would find such a spot a congenial halting place? As you approach that pond with the mossy banks, can you not see a flock of teal preening themselves in the bright sun, and while you are gazing at them are you startled or not by the loud *ongchk* from the old goose at the head of her clutch who, recognizing while still in mid-air, all the elements of an anserian paradise, young eel-grass, fresh water and convenient sandbars, announces her determination, not, however, without considerable discussion on the part of the youngsters, of staying till cold weather?

Here formerly the caribou in large numbers ranged freely over the whole island, cutting the moss into deep, narrow and meandering paths as they followed each other in single file from one pond to another, and many of the paths over the barrens, now used by the few inhabitants, are asserted to be the original caribou trails. The animals themselves disappeared from the island, from eighty to one hundred years ago. On the sandy shores of the island in former days the walrus was accustomed to land, and must have afforded noble and successful sport to the hunters of those times, for large heaps of their bones were still in existence, and seen some sixty years ago, rapidly being buried by the accumulating soil. At the present time these evidences of a fauna long since extinct are lost to view, and their place of burial even is unknown; tradition merely asserting that it was somewhere in the dense forest. On the open and quaking bogs the Canada geese formerly built their nests and reared their young, content with this bleak and desolate plain without pursuing their further journey toward the Arctic circle, and there they were annually slaughtered in large numbers by the Micmacs with simple clubs during their moulting season till, after one raid, more determined than usual, goose patience became exhausted and the whole colony migrated, and has never returned for breeding purposes, although the Indians have long since given up frequenting the island, and the knowledge of its topography is rapidly becoming a mere tradition of the tribe. Here, some two centuries or more ago, Charles, afterward the Sainted, one of the many enthusiastic Jesuits so intimately and honorably connected with the early history of Canada, is known to have established a mission, which implies a considerable number of inhabitants, but all traces of them and their works have so completely disappeared that no tradition even exists of the seat of their settlement. Early in the present century a few families of Scotch and French settled in some of the less exposed situations, and their descendants still remain, combining the occupation of farming, fishing, shooting and, as opportunity occurred, honest wrecking; a hardy, hospitable race, many of them with the intelligence which is begotten of intimate association with the wild aspects of nature, and especially with the ocean, and all of them with what we are given to calling thriftlessness, an outward expression of the inward despair produced by the continual contention with the elements.

Here for many years a friend and myself have found a resting place when on our annual pilgrimage from the heat and worry and rush of the city, till we have got to love the bleak barrens, the roaring sea and the howling winds. Every nook and corner is known to us; there is scarcely a pond at which we have not shot ducks or geese, a sandbar upon which we have not grounded our canoe, a gully or brook which we have not explored. On the banks of one of the salt-water bays stands a group of about a dozen hackmatacks which have attained the unusual height of twenty feet, a veritable oasis in a desert of whortleberry bushes and moss. Among the trees runs a small brook of clear, fresh water, taking its head from a couple of small ponds a few rods back in the moss, having worked for itself a channel into the peat some five feet deep. Beneath these evergreens we have for many years pitched our tents as the summer approaches its end, ourselves and our faithful French canoemen, who have piloted us up and down many a noble stream in other portions of the Provinces when we were casting the fly for salmon and trout.

Our youthful enthusiasm is somewhat abated; the cold, gray dawn has lost much of its early charm, and several hours in the bushes wet with dew before breakfast has ceased to have their old fascination. I fear we should be called but lazy sportsmen.

> "Forty times o'er let Michaelmas pass,
> Grizzling hair the brain doth clear;
> Then you know a boy is an ass,
> Then you know the worth of a lass,
> Once you have come to forty year."

A bright day, with the ever changing light and shade on the barrens, the views on the mountains twenty miles away over the sea, the ripple or the surf of the ocean, the wonderful cloud effects, these, with a very moderate amount of sport, constitute our true enjoyment, and we could justly say with the Duke in "As you Like it:"

> "Who would ambition shun
> And loves to live i' the sun,
> Seeking the bread he eats,
> Content with what he gets,
> Come hither, come hither, come hither.
> Here shall he find no enemy
> But winter and rough weather."

The pursuit of the game possesses all the elements of true sport, an intimate knowledge of the habits of the birds, a study of the wind, weather and tides, familiarity with the country, the use of dogs for retrieving, a quick eye, a steady hand and a hard shot.

The dusky ducks breed upon the island in large numbers; all other game visits it only in the course of migrations north and south. One of the earliest to arrive in the latter part of

August is the dough-bird, soon followed by the jack curlew, and by a large variety of the different sorts of shore birds, plover and sandpipers. The first northerly winds after the 10th of September bring a few geese, often in clutches of from two to ten, but occasionally in flocks of from thirty to fifty, and as the weather becomes colder they arrive in larger numbers and remain till driven away by ice. With the geese fresh ducks come, dusky ducks, gadwalls, blue and green-winged teal, scaup, and the non-edible and therefore not game birds, cormorants, loons, shelldrakes and grebes. Large flocks of golden plover are early mixed with the curlews, although they always seem to be a little later in arriving. With the first real cold of October the brant appear, and by this time the curlew and plover have mostly departed south.

Come and visit us for a few days' sport, but as you land from your boat be a little careful in entering the precincts of our oasis, for the two Chesapeake Bays, stretched in the sun in front of our tent, have quick ears and sharp eyes, and, although perfectly good-natured at home, when they get away into the wilderness seem to think it their duty to guard us against all intrusion. Down Ripple! Down Rogue! Now come in and go through the canine introduction of being smelt, and you are all right, only do not touch anything. It is a bright sunny day, with a moderate breeze from the westward. At sunrise we saw several hundred ducks come down from the ponds into the next bay, where they are still feeding on the seeds of the eel-grass, but in a couple of hours the tide will begin to make there, and when the water becomes too deep for comfortable feeding they will go up to drink and preen themselves at the same pond from which they came in the morning. Meantime John will get us an early dinner. The walking is very heavy; at every step the foot sinks several inches, but fortunately our destination to-day enables us to use boats. We row about a mile, then cross on foot from the bay to the shores of a large lake, and launching a birch canoe which was hidden in the bushes, paddle to the opposite shore. As we go you see at a glance the whole geology of the island; the banks, almost perpendicular, show each successive layer of peat, and the traces of fire are distinctly visible in many of them. Having crossed the lake, about a mile, we walk some forty rods and come to the suspected pond. An examination of its shores proves that we were right; the wet moss on the edges shows many little oval depressions where the ducks have rested, and the edges of the water are covered with dry feathers, the refuse of the toilets of many birds which slept here the night before. In those two clusters of dwarfed junipers we conceal ourselves, and soon see a host of birds arise from the bay two miles away, but after circling once or twice they all pitch again; no, not all either, for a half dozen separate and start straight for their drinking place. As they get over the Big Lake they leave and are lost to view, but suddenly appear over the bank and pitch into our pond, where, just as they are touching the water, we drop two and wound a third. The two dead are readily retrieved, but the wounded one disappears beneath the surface and does not again show himself.

With the dog we begin the circuit of the pond, he is still a puppy and has not learned to do it himself, when suddenly with a single "quack" the duck springs from the bushes on the bank into the water and immediately dives, but the dog saw him, and springing with his whole strength on to the spot where the last bubbles appear, he vanishes for an instant as completely as the duck had done, and emerges with the bird in his mouth. For the next two hours the ducks are continually leaving the bay, some come our way, some go to other ponds. By the time it is high tide in the bays all will have left their feeding grounds and have settled in fresh water. We shoot with variable success; some are easy shots, many are difficult, for the birds may appear on the right, left or directly overhead, and the misses are frequent enough to take all the conceit out of us. As the sun is sinking behind the forest we start for camp. Our bag is not large, a dozen black ducks only, which would make a Long Pointer or Chesapeake Bay gunner smile with contempt, but it will feed the camp for two or three days, and as we set the sail of our canoe and dance across the lake with a fair wind we think we have had our fill of enjoyment in the scenery, the air, the dogs and the game.

To-morrow with favorable weather we will try for a goose. They are in fair numbers, have not yet been disturbed and have got into their regular courses, feeding at night in the small bays on the roots of the young eel-grass, and as the tides rise in the morning, they go to the Great Lake to drink, thence to the large outside bays for the forenoon low tide, and as the next flood comes return to the lake to drink and then again to the small bays for the night. A strong head wind is necessary to bring them down within gunshot, the stronger the better, up to half a gale. If it is from the westward we will try to meet them as they enter the lake in the morning; if from the eastward we must meet them on their return in the afternoon. The pocket aneroid shows a fall of thirty-hundredths since noon and a small bank of clouds is visible on the sea horizon, but considerable changes of the barometer often occur here without much meaning, and the glorious, clear sunset looks like fair weather. The geese also do not believe there is to be a change, for although feeding in hundreds, not a quarter of a mile from camp, there is a general conversation among them, but only an occasional slight quarrel between two young ganders.

John's axe wakes us the next morning, and untying the flap of the tent we look out. It is a dead calm; the bay in front of the camp and the ocean beyond are absolutely without a ripple, and the fiery rays of the rising sun are shooting far up toward the zenith from behind the bank of clouds which has not risen perceptibly since last night. On the further side of the bay the geese and ducks seem twice their natural size through the almost imperceptible mist over the water. There is no need of hurry this morning; the birds will not move till forced by the tide, and when they do they will fly sky high. A luxurious bath in an excavation of the brook with just a suspicion of smudge from a couple of brands from the camp-fire to keep off the mosquitoes, and a leisurely breakfast of boiled teal, "whack," eggs, coffee and toast fill up two hours without giving any improvement in the weather. But the off-shore wind of yesterday and the calm this morning have given the striped bass a chance to cross the bars and get at the sand eels, smelt and other small fish which abound among the eel-grass of the bays; the water in the bays is just right, turbid enough from the intermixture of sand to prevent the fish seeing us even though the sun is bright, and yet not so roily as to prevent their seeing the bait.

Taking our rods and light guns we walk across the neck to the next bay where we have another canoe, and in twenty minutes are at the gully, picking up a few redbreasts and sanderlings from the flats on each side of the channel as we go. The fish here, with this slightly turbid water, are not fastidious; a single shrimp on a five-gut snell, even if the shrimp could be obtained, would get you but small fish. We rig our two hundred yards of braided linen line with a double gut leader, and a large hook with double snell, so as to use a sliver of fresh herring three inches long. If the water is sluggish a small sinker and float are advisable, but as the current increases with the tide, the float can be dispensed with. We take a few fish at the gully, but successive swirls up the channel above us show that the fish are rapidly passing, and we hasten to get to the forks of the channel half a mile above, where every fish must pass within sight of our bait. Anchored here, we have our hands busy for the last two hours of flood tide, each rod with a fish on almost all the time, and sometimes eighty yards of line out on each side of the canoe at once. Twenty-four fish to two rods is a fair morning's work; the largest is sixteen pounds, the smallest three. Exceptional states of weather and tide, however, only give such full scores. On our way home we get a crack at a flock of golden plover, and of the four brought to bag three are young birds as shown by the plumage, about the same proportion which we have generally found here.

Meantime a southeast wind has sprung up, the bank of clouds to the eastward has risen so as to obscure the noonday sun, the barometer is down another half inch, and we are evidently in for a storm. Rain keeps up in camp the rest of the day, and by night we have a southeast gale and a perfect flood of rain, but our tents are absolutely waterproof from a soaking with parafine wax, and our only risk is from the wind, in some of its sudden gusts, "blowing everything out of the gaskets." However, we make a fair night of it, and look out the next morning on leaden skies filled with low-flying scud, heavy rain and no abatement of the gale; the outer shore lined with foaming breakers, and the air filled with their roar. Not a bird is to be seen, but we know they are gathered under the lee of the high banks and will not stir in such weather, the whole ocean becomes a fresh-water pond in such rain, and if we could get near enough we should see the geese twisting their long necks till they could seize the feathers between the shoulders in their bills and then running their bills along the whole back scoop the fresh water off the feathers by the mouthful, while others, more dainty, take their drink by skimming the fresh water from the surface of the bay as the housewife skims off cream from the milk. After noon the scud begins to fly higher, the clouds are to be seen through it, the rain ceases, the wind hauls into the east and becomes only a stiff breeze. Toward sunset the clouds partially break up, and a streak of sunshine appears, but beneath the clear sky in the west is a dense, leaden cloud, and the barometer sticks at 29.30. Having finished supper and congratulated ourselves on the stars which are appearing through the clouds, we look again at the aneroid to find 29.20; *facilis est descensus Averni*, in ten minutes more we have 29.12. We call all hands, and, notwithstanding the loudly expressed willingness of John to take the aneroid for his share of breakfast if the storm is not over, we settle the tent pins and posts more firmly, and stretch every rope taut. Not a useless precaution, for in half an hour, as suddenly as though discharged from some immense cannon, a gale from the north is upon us, in comparison with which that of the previous night seems a zephyr. We turn in, but you might as well try to sleep in Bedlam; the creaking of the trees, the hissing of the wind through the branches, and the flapping of the fly and back of the tent render it impossible, but thanks to thorough workmanship and new ropes, everything holds, and as the gale abates toward morning we get a nap.

The rising sun gives us clear skies, and 29.90 on the aneroid insures us a heavy northwest wind. It is such a perfect goose day we will take all the chances and, sending canoes into each bay, we turn out every goose there, knowing they will go outside and return to the lake at the next flood tide with the wind in their teeth. The wind has raised such a swell on the lake that we must walk to-day, and the three miles we have to cover is equal to ten of ordinary travel so far as fatigue is concerned, for the footing is very soft. We make the circuit of the Great Lake and take our stands on a sand beach of the lake toward which a little "sag" in the plain leads, with a bank five feet high in front of us. The beach is in a little bay which projects a few rods toward the spot at which the geese are feeding two miles away, but lies a considerable distance to leeward of their direct course to the lake. Your goose, or at least our geese, when pressed by head wind, and flying low, prefer the lowest land and make for the nearest bit of water, recognizing that their enemies are all terrestrial. One old gunner who has studied them for fifty years, is confident we are within forty rods of the place where every goose will pass into the lake if the wind only holds steady, and by crouching under the bank we can shift our position by ten rods in either direction. This ought to give us some good chances.

Peeping over the bank we see the first flock rise and head far up-wind, but as they approach nearer they fall off, then again head up; thus by a sort of tacking they get near, and as they recognize the vicinity of the lake, lower till they are not more than ten feet above the plain, and head directly for us. Wait till they are abreast of you, aim about the end of the beak, and a little above if they are to windward, a little below if they are to leeward, old W. says, for they will swerve when you put up the gun. We try it and one drops; I make a clean miss at the leader, not having calculated the swerve properly, but as he is rising almost perpendicularly the second barrel, thrown fully three feet above him, brings him into the lake with a splash, and Rogue with a yelp of enthusiasm carries him into the long grass. No command or coaxing will make him bring the bird in; it is the puppy's first goose, and, laying it down, with long-drawn breath he revels in the (to him) delicious aroma, and mouths and noses it till the feathers stand out in every shape, and I, dreading what I shall find, hasten to get it from him; but the skin is not even broken. Soon another flock rises in the distance, then another and another till a dozen or more are headed for us. The first of these is a little high, and W. whispers to us to let them pass, for just behind are two or three flocks which are lowering every minute. They pass over our heads, and getting above the lake set their wings and begin tumbling, using their outstretched pinions as a parachute. The next two flocks give us some good shots, but those behind see the smoke and rise beyond our range. Once over the lake, however, they tumble like the others with a sense of perfect security.

Ripple is off in the stormy lake after a wounded goose a quarter of a mile out, which she secures; Rogue is sent for another in the calm water under the bank; it is good practice for him, as the goose is only wing-tipped and will probably dive, but as he approaches the true goose nature is seen, for instead of disappearing, she contents herself with stretching her head and neck along the surface of the water, and keeps still till he seizes her by the rump and tows her ashore, where he lays her down to shake himself. But if goose stupidity was shown before, we now see goose slyness, for as soon as the dog's eye is off her she slides into the water and disappears with the dog after her, who in an instant has her again on the bank, and a pin inserted at the base of the skull severs the cerebellum and ends the "circus."

The next flock passes to windward about two hundred yards, and it is evident the wind is falling. We shift our places also to windward and get two or three more shots. Then as the wind dies out the birds fly high, and their course cannot be calculated; we give it up, and sending a man for the canoe, ferry ourselves and bag across the lake, thus saving two-thirds of the walk back, no inconsiderable saving with a load of eight geese. Two wounded geese in the lake will undoubtedly climb the bank, be caught and devoured by foxes before morning. With the canoe we might even now find them, but with an eye to the future, we prefer not to disturb the hundreds of geese yet in the lake. Let us hope the foxes are grateful.

Such are a few samples of our days; the bags are never large; our best day yet is thirty ducks, but the variety of the game and the uncertainty of what is coming next, makes the sport interesting, and nature in her milder and in some of her sternest moods is seen here to great advantage.

TOOTOOGUSE.

BETWEEN THE LAKES.

Fifth Paper.

THE RETURN TO CIVILIZATION.

THE morning following our arrival of our young friends, Cox and Weller, it was proposed by them to go in search of a trout stream, of which they had heard from the lips of an old land-looker, who had gone through the country some time before, in the interest of some one of the numerous lumber companies that operate in the pine woods. The Greek Professor declined to go, as he purposed jerking a part of his deer killed the day before, in order that he might carry it home and show to his friends and especially to the president and faculty of his college that he had killed a deer. And, I may add in this connection, that he not only took the jerked meat home with him, but the skin of the deer also; and I have it on good authority, that his "Liddell and Scott," the very one he uses in his recitation room, is covered with that identical skin; and it is further reported, that whenever a rascally student slips up on a particularly difficult rendering of a passage in Homer or Xenophon, and the patience of the preceptor is put to the strain in consequence, that student adroitly manages in some way to introduce the lexicon cover, when the professional frowns are removed and the delinquency is overlooked.

I do not vouch for this, however.

The particular place we set out for that morning was a widening in a stream constituting a small lake in the woods about three miles from our camp, and I was much impressed with the skill in woodcraft displayed by our friends. We went in the Wawa to the east end of Beaver Lake, where, after inspecting the map, young Weller went ahead with compass in hand for the new trouting grounds. I do not think I ever had quite so ugly a tramp as that morning's. The compass bearer started on a line, and the success of his leadership depending on keeping that line, he swerved from his course for nothing. No matter what the obstacle, it must be surmounted. Nor did he dally on his way. He had been connected with the lumbering interests from his youth up, and locating pine lands was a familiar business to him, and he had been trained to celerity of movement. Down tree tops were climbed over or crawled under; swampy places were waded; brush thickets were squeezed through. The Judge, who went in advance of me, found his 220 pounds a greater inconvenience than ever before, and he went crashing his way through tree top and brush thicket, and floundering over logs and swampy places like a wounded buck. A half a mile of cedar swamp brought us to a high hill, the ancient lake shore, which we climbed, and our guide, after taking his bearings, next led us through a comparatively level brushy woodland, and finally brought us out as nearly the center of a little lake—the result no doubt of an ancient beaver dam on a small creek—as we possibly could have come. The correctness of judgment in locating the lake, which neither one of the young men had ever visited, and the accuracy with which they had held to the right line through swamp and woods, was a marvel to me.

The first thing we took notice of on emerging from the thicket, was a large buck with wide-branching antlers, standing on the further shore of the lake. He was no doubt an old inhabitant of these woods, and had visited this lake hundreds of times before, and for the first time he saw men on its shore. He was greatly amazed at the sight, and as he lifted his head aloft, at not to exceed seventy-five yards distance, and gazed wonderingly at us, I thought he was one of the most beautiful animals I ever saw. Although we carried two rifles, not a shot was fired. We had venison in camp, and so when the lordly fellow threw his great wide-spreading tail over his saddle and disappeared in the thicket, our riflemen were glad he was gone.

The little lake was found to be about an eighth of a mile in length by about seventy-five yards in width, and it was literally swarming with brook trout. Fishermen who have never seen the trout save in swiftly running streams, will reluctantly give credit to my story when I say they went in schools of hundreds like minnows. At the low end of the little lake, under some old logs, we took them, running from eight ounces to a pound; elsewhere they were from five to ten ounces, a few running to fourteen ounces. After three or four hours' fishing we returned to camp, taking with us 305 trouts, and getting there in time to witness the most gorgeous sunset I think I ever saw.

The sun at that season went down in the northwest, over the broad lake, and on this evening the waters were as smooth as glass. A bank of purple clouds lay in the track of the descending luminary of sufficient density to destroy its dazzling brightness. For twenty minutes before it disappeared it shone like a great rose-colored ball of fire, and a luminous track, equal to the sun's apparent diameter, ran from the shore at our feet, out and up to the sun itself. As the sun neared the lake's surface it assumed an elongated appearance, due to atmospheric effect. In its neighborhood the heavens were aflame, and the waters beneath reflected back like roseate hues. Presently it touched the wave and slowly passed out of sight. When half gone it resembled a crimson crown set far out in the bosom of the still waters,

and maintained its beauty thus till it finally disappeared. And now the lake claimed our attention. The roseate hues that veiled the waters gave way to bands of soft purple and gold alternating, running parallel with the shore and extending nearly out to the line of vision, where a luminous veil-like band interposed, more beautiful if possible in its sheeny softness than anything that had gone before. From our lofty outlook we sat in our camp chairs, and in silence drank in the beauties of the scene. The sunsets from our camp here were always beautiful, but this one was preëminently so. The day done, the camp-fire was mended, and the long twilight enjoyed. To the dweller in the lower latitudes, one of the most interesting features of this region is the long twilights. The transcendantly beautiful lake sunsets may occasionally be seen, but the long twilights are of nightly occurrence, and the summer wanderer never forgets to admire them. To the sportsman everywhere the camp-fire brings comfort and happiness, but to the sportsman in the Lake Superior latitude the camp-fire and the long and gloriously beautiful twilight, and the murmuring lake breeze in the pine boughs, gives a witchery to the summer evenings nowhere else to be found.

The succeeding day, in company with our young friends, we went back to the scene of our trouting the day before. The Greek Professor, on having sufficiently cured his jerk, accompanied us. The same buck (we guessed him to be), that had been so much surprised at our appearance the day before, returned to the lake while we were there, and walking out of the brush to the water's edge, he was once more astonished to see men on the opposite shore, and he again scrutinized us closely, his scrutiny resulting as it did the day before, he again spread his broad tail and disappeared in the brush.

Our catch this day was about the same as the day before. The Judge took but few saying that he was tired of that kind of sport, but the Greek Professor, zealous to outnumber his catch of the day before, held on till he was one ahead, when he too ceased. In the two days, 754 trout were taken, which our young friends put on ice and sent up to Marquette, to be distributed among their friends.

And now, if any one wishes to rise in his place and denounce "trout hogs," about this time is as good as any. I have no defense to make, but will have something myself to say in the prosecution before I close.

Before leaving, rain began falling, and we had a wretchedly bad trip home. Our guides lost their way, and led us through thickets and swampy places, until it began to look as if we were destined to lie out over night. In their wanderings they came to the little lake lying northeast of Beaver Lake, and which is a part of the system to which that lake belongs, and they re-discovered it and named it Rainy Lake. Finding our way out of the woods, however, we reached camp barely in time to escape a soaking rain. That night we prepared and ate our suppers under great difficulty. About dark, a violent thunder storm passed over the lake, from the west to the east, and after some time it (or another) returned, and went back to whence it came. The elements over the lake seemed to be in great commotion, and notwithstanding our greatly wearied condition, we sat in the door of our tent and watched the play of the lightning and listened to the bursting thunder till a late hour. The flashing lightning gave momentary illumination to the black, boiling waters, and far out we could see the outline of a steamer, and the long trail of smoke hanging low over the inky waters behind her. At a late hour we went to bed, and all through the night, whenever awake, I could hear the rain beat upon our tent and the waves pounding on the shore.

For two days the weather was catchy, but on the evening of the second our two friends left us and returned to Munising. Our time being up, we commissioned Mr. Cox to send a boat for us as soon as he returned, and on the following Saturday morning he himself came after us. The Indians were all gone on a "packing" expedition for a company of land-lookers to Minnesota, and so he came in lieu of one of them.

There was quite a breeze blowing that morning, with a prospect of a gale toward the middle of the day. But the fishing tug which made Munising, its headquarters, was off the Grand Portal two or three miles, and if we could manage to get to that place in time, we were sure of being picked up by that steamer on its return. In a very short time we "pulled up stakes" (see the origin of the phrase) and went aboard the Sand Piper. "Now don't get scared!" said Skipper Cox assuringly, as his vessel swung round till the wind filled the sails. And then away she went over the waves like a courser. Now it was that the Judge's 220 pounds became useful. Seated amidships, it became his duty to "cut ship" by sliding to the right or left, according to the force with which the wind blew. Unfortunately for our comfort, it came in cat squalls, and in spite of the nimbleness which fear lent to the ponderous Judge, it did seem that we would capsize. At any other time and place I think the shuttle-like swiftness with which his heavy keel slipped back and forth on the cross board would have produced boisterous merriment, but with the danger of capsizing at any moment staring us in the face, we watched the ponderous shuttle-like movement in solemn silence, with a feeling that as long as it was kept agoing the chances were with us.

At length we reached the leeward side of the Grand Portal, where we lay in a little haven till the tug came along, when our boat was made fast to it and we were taken on board. By this time the wind had increased to quite a gale from the west, and the little steamer found it no holiday affair to plough her way through the rising waves.

In a large tank aft the little cabin, a hundred fish or so, whitefish, lake trout, and perhaps some others, represented the morning's catch. The lake fishing all the season has been poor, so poor that the catch had not defrayed the expenses, and in two weeks thereafter the tug was taken off that part of the lake. The fishermen with whom I talked, spoke freely of the annual decrease in the numbers of fish taken in the lake—a decrease which, if it continues but a few years longer, will see the end of the fishing industry on the lakes.

Shortly after we went aboard and the little steamer was on her way, one of the men, who, with others, had just completed the work of cleaning the fish, seized a handful of the offal and threw the bloody mass overboard. A flock of gulls had been following and screaming in the wake of our vessel, and as soon as the mass struck the water they pounced down upon it and gulped such bits down as they managed to get hold of. "Feeding the gulls" was an every-day occurrence with these fishermen, and the birds had learned not only to follow the vessel but to look for their choice food, at the motion of a hand. A bit not too large was gulped down in a trice, but if it were too large to swallow readily, the finder would either drop it after an ineffectual effort to swallow, or else be robbed of it by some of his greedy companions. Frequently two, three or more would get hold of the same morsel, and sometimes a straggler, who could not find a beak-hold in the piece itself, would seize a neighbor by the wing and swallow at that. And such a screaming and flapping of wings would ensue, until perhaps the flock would fall to the water, where the screaming and flapping might go on for some moments longer until indeed the morsel were swallowed or else lost in the waters.

About 3 P. M. we reached Munising, and the seat of the Judge's trousers being greatly worsted by the morning's work balancing the Sand Piper, we went into quarters to give him a chance for repairs.

Our camp we made on the bay shore under the shadow of a cluster of maples, and within thirty yards of the tent, in a dimple in the bay's bottom, we caught with the fly speckled trout of fair size and of gamy quality. The only difference we could discover between them and their cousins of the streams was in their color. The markings were the same, but their bright colors had faded out. At the dock we were told, trout from two to three pounds in weight were frequently taken. The natives insert hooks in an empty metallic rifle cartridge and pouring melted lead into it, make a grappling hook that never fails to do its work when once in a trout's mouth. This cluster of hooks they bob up and down and the large trout, attracted by the polished shell, lay hold and are yanked to the dock.

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Sixth Paper.

As we floated out of Lake Marsh it was known that somewhere ahead there would be found the largest rapids on upper river, and by some form of improper interpretation the from our Indians, or in some way we had the idea that they would occur very soon, within three or four miles, so to speak, and I undertook the herculean task of walking on ahead on the beach and finding them to signal the raft so that it would have ample time to reach the bank, for the river was now 500 to 600 yards wide in places. It turned out afterward that the rapids were more than fifty miles further on. I had walked more than three miles when I came to a peculiar kind of creek distinctive of this district of the river, that is, not very wide, but altogether too wide to jump, with slippery slopes of clay, and so deep that the bottom could not be seen or reached with a pole. These streams have a current like a glacier, and the one that stopped me—and I suppose all the rest—had the same unvarying width for over a half a mile from its mouth, beyond which I dare not go for fear the raft passing me, when I returned and fought mosquitoes, and waited for it to come along, when I would have the canoe pick me up.

The first traveler along the river was one of our old Tahk-heesh friends, who came down paddling his cottonwood canoe with his family, a squaw and three children, wedged in the bottom. He comprehended my situation and I tried to make him understand that I wanted simply to cross the canal-like creek, while he, remembering a few trifles he had received at a few camps back, thought he would extend his services and take me a short way down the river, to which I did not object, still believing that the rapids were but a short distance ahead. The rain was falling in a persistent drizzle, which, coupled with my cramped position in the rickety canoe made me feel anything but comfortable. My Indian patron was evidently feeling worried about not meeting other Indians (for he had previously promised me that he would have a number at the rapids to portage my effects around if my raft went to pieces in shooting them, as they were all confident it would) and he was stopping his not unmusical gurgling strokes of his paddle every minute or two to scan the river banks or to listen if he could hear anything of them. Finally he became discouraged at the prospect, after he had descended about three or four miles, and diving down into a mass of dirty rags and Indian bric-a brac of all sort he fished out one of the brass mounted Hudson Bay flint lock horse pistols I have already described in a former article as one of their possible possessions, and I was horrified at the sight for I felt sure he was going to use it as a signal. He took out the bullet and held it in his teeth, and I felt the least little bit better but still terrified beyond measure, and it was not until he pointed it directly at me in the other end of the canoe that I felt at all safe, and as I heaved a deep sigh of relief, he fired, and I could not help but thrill with the liveliest gratitude for his consideration for me, and the warmest admiration for his indomitable courage as he stood unflinchingly at the butt of it and pulled the trigger. For fear that he might ask me to fire the next one, however, I told him in the sign language that I would swim ashore and run around in the woods and back country and look them up, if that didn't bring them to a response. It awakened no reply, from which I inferred that none of the others had mule pistols, at least within a radius of 500 miles of here, or probably did not fire them off, and as it was getting well along in the evening my "Stick" friend pointed his canoe for an old camping place on the east bank of the river (although the canoe was so warped and its nose so broken that you could have conscientiously said it pointed in any direction), and with a few strokes of his paddle he was soon at the shore and I went into the simplest camp I ever did in all my life, for all that was done was to pull an old piece of canvas over a pole and crawl under it and imagine it kept out the rain, which it did about as effectually as if it had been a crochet tidy. I certainly think that if he had covered me with his horse-pistol again it would at least have been warmer.

There was one good thing about a rain storm in Alaska, however, and that is the philosophical repulsion that exists between a moving two-grain rain-drop and a stationary grain of mosquito when they come in contact. All along this bank the dense willow growth crawled up and leaned over the water, and I was afraid there was no camping place to be found, until I saw a place where a little spur of spruce-clad hillocks infringed on the shore, and here I halted the raft and we made an uncomfortable camp. Everywhere we could see muskrat wakes as they went swimming backward and forward across the river, but we secured none. Fish of some sort kept jumping in the river, but the most seductive "flies" were unrewarded with a bite, although the weather was not of the kind to tempt one to hunt or fish simply for sport.

The next day, the 30th of June, was but little better, and we got away late from our camp, our Tahk-heesh friend accompanying us in his canoe for the purpose of telling us just where we should find the rapids, and of course, disappearing ahead so as to keep us feeling more anxious about it. At one time, about eight o'clock in the evening, we heard roaring ahead as we swung round a high clay bluff, and were conscious of the fact that we were shooting forward at a more rapid gait, and the raft was swung on shore and a prospecting party sent out, which revealed that there were rapids extending a distance out into the river, but of no consequence to us. In fact, they were directly in front of our position on the shore, and so swiftly was the current, that we could not get out into the stream fast enough to avoid sticking on the rough bar of gravel and boulders, and shortly after the crew had jumped in and were preparing to pry the raft round into the stream, the most violent splashing was heard on the outer side of the craft, and it was soon found that a goodly-sized grayling had hooked himself into a line that some one had allowed to trail over the logs in their hurry and excitement of attending to more important duties connected with the supposed rapids. He was divorced from the hook and when thrown over another one repeated the operation, and it soon became evident that we were getting into the very best of fishing waters. After the raft swung clear of the outer boulders of the reef, several lines and flies were gotten out and it was quite amusing and entertaining to see the long "casts" or rather attempts at them as we rushed by distant ripples near the bends of the banks, more than one of which were successful in landing a fine grayling.

That evening we camped late (about 10 P. M.), near where a couple of ripples were formed by gravel bars running out into the stream, and some fifty or sixty grayling rewarded the three lines that were kept going until about 11, or till it was too dark to fish with any comfort. The grayling caught that evening seemed to be of two distinct sizes, the larger averaging about a pound in weight, the smaller about one-fourth as much.

On the morning of July 1, we approached the great rapids of the Yukon River, our adventures around which shall form the main part of the next article.

[To be continued.]

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Twelfth Paper—Folk-Lore.

THE ADVENTURES OF KUT-O-YIS.

Long ago there lived on the Maria's River a very rich old man, and he had a wife and three beautiful daughters. All the young men looked at these young women and wanted to marry them, but their father said no. No one but the richest young man could have his daughter. From a far off camp came a young man, very rich, and he married the three sisters.

After a time this young man began to treat his old father-in-law very badly. He took all his dogs away from him and his weapons, and gave him very little to eat. Not far from where they lived was a large cave, where this son-in-law, whose name was Many Feathers, kept a herd of buffalo, and every time he wanted meat he would let one out and kill it. One day, when he let one out, he only wounded it, and it ran out on the prairie. He gave his father-in-law a bow and arrows and sent him after it. The old man chased the buffalo a long way, but could not catch it. As he was going along the trail he picked up a large clot of blood which had dropped from the animal's wound and hid it in the folds of his robe. When he returned home Many Feathers was very angry, and he said: "Why did you not kill that cow?" "Because I couldn't catch it," replied the old man. "What did you pick up out there on the prairie?" "Nothing," said the old man. "I ran a prickly pear in my foot and stooped to pick it out."

Then the old man went to his lodge and said to his wife, "Go quickly, old woman, and get some water, I have a clot of blood which we will boil and eat." When the water was hot they threw the clot of blood in it, and pretty soon they heard a cry like that of a child, but they looked in the kettle and could see nothing. Three times they heard this cry, and when they looked in the kettle the third time they saw a beautiful baby boy, and they took him out and named him Kût-ō-yĭs: Clot of Blood. In one day the boy grew to be a man, and he said to the old man, "Father, why have you nothing to eat in your lodge?" Then the old man told him how his son-in-law had taken all his dogs and weapons away from him, and that they would have starved to death had it not been for their youngest daughter, who stole a little meat for them whenever she could. "Never mind, father," said Kût-ō-yĭs, "let us make a bow and arrows and a knife and we will go hunting." When they had made the weapons they went out on the prairie and Kût-ō-yĭs killed a fat cow.

When they were skinning it the old man saw Many Feathers coming toward them, and he was afraid; but Kût-ō-yis lay down behind the buffalo and said: "Let him come, I will kill him." When Many Feathers came up close he said, "Who killed that cow?" "I did," replied the old man. "Well, I am going to kill you," said Many Feathers, and he commenced to string his bow, but Kût-ō-yis jumped up and shot an arrow through his heart. Then they went home and Kût-ō-yĭs killed the old man's oldest daughters, for they had not pitied him, and he took the youngest one for his wife.

Now, way out in the Sweet Grass Hills, there lived a big wolf, so big that a man was only a mouthful for him. Kût-ō-yis went to kill this wolf. When he came to where the wolf was, he let it swallow him, and when he got in its belly he found many people there, some dead and some yet alive. And Kût-ō-yis said to the living, "Get up and dance," and they all danced. Kût-ō-yis held a knife firmly on the top of his head and every time he danced the knife cut into the wolf's heart, and pretty soon they felt the animal sway and fall over dead. Then they cut a hole in its side and crawled out, and Kût-ō-yis took off the scalp and gave it to the sun.

Kût-ō-yis killed all the bad animals. There were two great man-eating snakes which he killed, and he let only one little one live. "The people will not be afraid of little snakes," he said, "so you can live and make little ones."

New Glasgow Rod and Gun Club.—At the annual meeting of the New Glasgow (Nova Scotia) Rod and Gun Club, held Jan. 31, the following officers were elected for the ensuing year: President, H. T. Sutherland; Vice-President, John K. Fraser; Secretary-Treasurer, J. Howard Cavanagh; Executive Committee, W. B. Moore, R. A. Walker, Jas. S. Fraser. The club is in a prosperous condition, owns a club-house, boats, decoys, and a trap-shooting outfit, and the members expect to do some tall shooting this season.

ADIRONDACK FOREST WASTE.

Editor Forest and Stream:

You are keeping the Adirondack Park question before the people. I am very glad to see the interest in it manifested by so many of the newspapers. But the side taken by the city papers is not the only strong side to the question. I am, as an individual, as much interested as any one can be in the preservation of the forest. My whole property interest is in the proposed park, and aside from this, I have given the subject of forest protection much thought, and have looked on with much anxiety at the destruction going on each year about me. There seems to be a general feeling that as soon as one is in the woods he is to have full liberty in all directions. If he wants a bit of wood ever so small he takes it from any tree within reach, no matter if it does destroy a large tree, valuable for lumber or shade.

The lumbermen, at least in this section, have never been particular about the timber taken from their lands. Their only aim has been to get all that would make lumber at that cutting, for in most cases fires follow the choppers within one or two years, and after the fire, in most cases, the land goes back to the State for non-payment of taxes.

The most destructive interest at work in this section is the cutting of spruce for clapboards. Very few trees are either large enough, or free from knots, to make clapboards. They must round up at the small end of the log fifteen inches at least, and where one log is taken twelve feet long, fit for clapboards, there will be from two to three other logs which would make good lumber, but as they are not wanted, they are left to rot on the ground with all the other cuttings in making roads and clearing away from the stump by the chopper, the whole forming a nice place to start a fire. Within ten miles of here there are hundreds of acres which have been cut over and have gone to the State in this way. The cutting of the hemlock for its bark is also very destructive to the forest in this season. It does not pay to draw the logs to mill for lumber. In the felling of each tree for its bark and in the cutting of roads there are at least twenty other trees broken or cut down. Most of the pine cut in this township in the last fifteen years has been cut to make shaved shingles, and as not one pine in five that are cut down will make shingles, there are hundreds of large pines on the ground rotting away.

A few weeks since I was in Malone and Potsdam. Each village is the center of quite a lumber interest. I met many persons who, knowing I lived in the woods, wished to talk about the proposed park, and I was greatly surprised to find so few persons who knew anything about the woods; but they seemed astonished that any one should think them of importance enough to need legislation for their preservation. Among others, I met several members of both branches of the Legislature. They, too, wished to talk about the woods, and were glad to hear the other side of the story. The real interest of Franklin county is the preservation of every bit of forest, but I fear the controlling influence will be the lumber interest, which means the cutting of everything possible to be made use of, either as lumber, firewood, or bark. Then much of the land will go to the State, as it is worth nothing for agriculture.

The one great complaint of the residents in the proposed park has been that the State holds its land but pays no taxes. They are right when they complain of this. As in my own case, I am the only resident in this road district, which is seven miles long; and nearly all the land has gone to the State. If the State pays no highway taxes I must do all the work on this seven miles of road.

Of the proposed bills Senator Lansing's is the least objectionable to the inhabitants of this section, and if it should pass, it would have to be changed in many ways to be of any value. A very strict enforcement of the law against all offenders must be made in every case or the law would be worse than no law. A great majority of those who frequent the woods look upon State lands as open to plunder for all purposes without a chance for punishment. They call it God's land—free to all." A. R. FULLER.

MEACHAM LAKE, Adirondack.

Natural History.

HORNS OF THE FEMALE CARIBOU.

Editor Forest and Stream:

I note with pleasure that you are bringing out a new edition of Judge Caton's admirable work on the antelope and deer of America. The volume is one which should be in the hands of every still-hunter who desires to really know about the game which he pursues. This announcement and the perusal of your notice of the book leads me to think that this is a fitting time to ask a question of your readers in relation to one species of our deer.

I do not know that the fact that the female caribou is always or nearly always provided with horns has ever been satisfactorily explained. This is the only species of our deer in which that sex bears horns, though there are on record a very few cases in which the female Virginia deer has been found to have one or a pair of simple spike horns. It is not to be supposed that in the caribou these horns have been retained in the female without some reason. What is it?

An intimate knowledge of the life history of the caribou would no doubt furnish a clue to the anomaly, but unfortunately very little is known of the habits of the species. During a recent visit to the home of the woodland caribou I received some information which perhaps gives a hint as to the use of the antlers to the female *Rangifer*. It is well known that the caribou, during the greater part of the winter, subsist almost wholly upon the reindeer moss which they obtain by scraping away the snow with their fore feet. When the snow covers the ground to any considerable depth, the pits which they dig to reach the food below, are excavated with considerable labor, and each deer has to work hard for its living. At this season—in the case of the woodland caribou, at least—the males and females collect together in herds which vary in number from ten to one hundred individuals. At this time the stronger deer drive the weaker ones away from those places where the food is best, or most easily accessible, and when a small deer has scraped away the snow from a good feeding place some larger and stronger animal is very likely to attack and chase it from the spot, and take advantage of the work done by the other. It will readily be seen that this condition of things might operate very disastrously for the young and female deer, if they were no better provided with weapons of defense than the larger and stronger ones, as while the older males lose their horns about the last of November, the young males retain theirs much longer, and the females do not drop their antlers until the spring. The possession of these weapons at a period when they may be so useful in aiding their possessors to obtain a fair share of the food, which can only be secured with some exertion, enables the younger and weaker members of the herd to stand on a more nearly equal footing with the stronger than they would have if they were without horns. This struggle for food continues during the whole winter, for in the region inhabited by the caribou the snow often covers the ground until May or June, and during all or the greater portion of this time food must be obtained by digging. During the winter the females are carrying their young, and therefore require more nourishment than do the males, young or old, and this may account for the fact that the horns are retained until the time when the young are about to be brought forth. This explanation of the existence of horns in the female of *Rangifer grœnlandicus tarandus* and its southern race seems on the whole not unreasonable.

I should like to ask your many Canadian readers whether any of them can suggest an explanation which is more satisfactory than the one I have mentioned, or can add anything to this. I should be much gratified to learn through your columns or otherwise what views are held on this subject by those who live nearest to the home of the caribou.

GEO. BIRD GRINNELL.

NEW YORK, Feb. 18, 1884.

OPHIDIANA, OR SNAKE GOSSIP.

BY CATHERINE C. HOPLEY, AUTHOR OF "CURIOSITIES OF SNAKE LIFE."

LOOKING over a file of FOREST AND STREAM for the last six months, a few notes on the subject of the Ophidia seem to invite a little discussion. "Ouachita," of Monroe, La. (Oct. 11), in allusion to my paper (Sept. 20) on the "spreading adder" or "puffing viper" (*Heterodon*), writes: "If my memory is not faulty I have found fangs in their mouths." To this, in the issue Oct. 18, "S." replies that he has "killed scores, but never found any fangs." Now, like the men of Cowper's poem on the chameleon's color, both correspondents, "Ouachita" and "S." may be correct. "S.," perhaps, sought *Heterodon's* so-called fangs in the usual place, viz., the front of the upper jaw. "Ouachita," perhaps, found them in the unusual place, at the back of the jaw; or, when he sought them they might have been erect and conspicuous, and when "S." examined the snake's mouth the fangs might have been depressed and inconspicuous. For, among the many seeming anomalies of serpent organization these harmless *Heterodons* have not only a pair of long, fang-like teeth, but they are mobile, *i. e.*, can be erected or depressed and put to use at the will of their owner, like true viperine fangs. Only they are solid teeth after all, not perforated and grooved, or connected with a venom gland. The family is for this reason called *Hetero-don*, which word, divided into two parts, easily suggests its meaning. As hetero-dox is something contrary to a usual saying or belief, and heterogeneous is a deviation from ordinary rules, so *Hetero-don* is an unusual or abnormal condition of teeth, supposing the normal rule to be a set of a regular and equal size, as in most harmless snakes; one of the latter group being called by some herpetologists *Tso-dons*, or even-toothed. Then, again, there is a family of *Lycodons*, which might be mistaken for venomous serpents, as they have a long, wolf-like tooth or harmless fang in front of the jaw. And there are the *Oligodons* or jaw-toothed snakes; the *Anodons* or toothless family; and the *Xenodons* or strange-toothed family, of which *Heterodon* is a member. The *Xenodons*, natives of Brazil, bear just as bad a character there as do the poor little harmless *Heterodons* of the north; they also have a movable back tooth, looking like a fang, but that does no injury. I believe I may claim to be the first who has described, if not the first who has observed this mobility in *Xenodon's* fang-like teeth. I also saw and described *Heterodon's* fang which I saw moving while the snake was feeding, the latter fact being confirmed by Prof. E. D. Cope, who himself had seen the same, though not committing his observations to print. Long back teeth in several families of snakes have been well known to herpetologists; but none of them, so far as my researches have gone, have mentioned the mobility of those in the *Xenodons*; not even Dumeril, our first and best authority. Having heard of these "strange teeth" in the Brazilian *Xenodons*, and that the snakes were looked upon as venomous, I became very desirous to see a living example and ere long I was able to examine the jaws of one, and then witnessed the working of this strange back tooth, and felt it, too, on pressing the jaw with my finger, as described in chapter XXII. of my work on snakes. These long teeth are, no doubt, useful in retaining the prey, which, for the most part, consists of toads and frogs swallowed alive and actively struggling. This singular dentition is only another example of those remarkable features in which snakes of such distinctly opposite families appear to be allied. Thus the innocent *Heterodons* have a broad head and a viperish aspect, even a movable fang, and in spreading themselves when molested they remind us of the cobra.

The child mentioned by "S." as having been ill after the bite of one of these "spreading adders," was probably timid and delicate, and might have suffered similarly from the claws of a cat, or the bite of any harmless animal. Terror alone would aggravate the danger. In the case of a cat, not the claws themselves, but the foreign and noxious particles which cling to the claws may injure the blood. The ill effects, therefore, in "S.'s" little girl were not a proof of a venomous snake, though even the common saliva of a non-venomous one may be acrid or injurious in the poor blood of a feeble person.

Though snakes may be broadly divided into the venomous and non-venomous, the teeth are largely concerned in classification, and as regards dentition, only the true viperine snakes (among which the whole rattlesnake family is included), possess the solitary pair of moveable fangs, "solitary" implying the absence of simple teeth in the upper jaw. In replying to "Ouachita," Sept. 20, last, I inadvertently said, "if he found four *rows* of upper teeth, he might be sure the snake was harmless." I ought to have added, "except in the *Elaps*," the character of the *Elapidæ* being a fixed fang and a *few* simple teeth behind the fang. Of this group are the Indian cobras. North America has no true vipers, South America only two, as yet known; all the most dangerous of the western serpents belong to the rattlesnake tribe, *Crotalidæ*.

"Ouachita" suggested that "constrictors and venomous snakes" might distinguish the two great classes; but a very large number of the smaller harmless snakes seize their prey and swallow it quickly, never once loosening their hold of it, and therefore have no need to kill it by constriction. Constrictors proper, are for the most part the largest and most powerful snakes, boas, etc., though several smaller families are truly constrictors, such as the American racers, and the little *Etaphis* of the eastern continent. And it is remarkable that some small snakes, though not true constrictors, that is, with an especial organization to enable them to constrict, make use of their coils to control unmanageable prey. This I have seen on several occasions while watching snakes feeding. In the small Brazilian *Heterodon d'orbignii*, which feeds on frogs, I once noticed the snake trying to swallow an inconveniently large frog, when *Heterodon* brought its coils to its assistance, to—as it were—help hold down its prey while it got a more convenient hold. *Xenodon* also does this, and so does the English common snake. It never occurs to them to kill the prey by constriction, their organization and instincts not dictating such a process, but being sufficient in case of need to help them out of a difficulty. Indeed the more we watch a snake and study its habits, the more we find in it to excite our wonder—it may even be our admiration—considering how the lack of limbs is compensated by the extraordinary powers it possesses to enable it to exist at all. Many readers of FOREST AND STREAM enjoy such opportunities for observation on their own farms and fields, others on visiting zoological gardens can witness and study snakes, and should they happen to be feeding at such a time, the observer can not fail to be interested and amazed at an organization so wonderfully adapted to their needs.

Before taking leave of the *Heterodons*, I may mention a case of the death-feigning, for which these curious little snakes are celebrated, and lately came to my knowledge. A lady in Florida was sitting reading on the piazza of her dwelling, when her son brought home and laid down near her a "spreading adder." The ladies of the family objecting to such company, he gave the snake a kick and sent it several yards on to a gravel path. The lady, as she sat reading, glanced occasionally at the snake, which for a long while lay on its back so motionless that she thought it was dead. But by and by the reptile almost imperceptibly—so cautious and gradual were its movements—got itself round to its natural position, and then by very slow and almost invisible degrees, crawled away till it reached a fence, when, like a shot, it was through and away out of sight. The lady thinks nearly two hours passed while the *Heterodon* was thus stealthily creeping off. The actions had certainly the suspicion of trickery; but, then it is possible that the snake was stunned and was thus slowly recovering from the injury. These *Heterodons* are worth studying.

A BLACK PIN IN A HAWK'S MAW.—Dr. A. K. Fisher, of Sing Sing, N. Y., one of the superintendents of bird migration, made a strange discovery last week. A fine specimen of the red-shouldered hawk (*Buteo lineatus*) was brought him by a friend. When he proceeded to skin the bird he was much surprised to find it in such good condition, and from this led to examine quite minutely the contents of its maw. Here he found portions of a frog, a salamander, a shrew, some feathers of a bird, and a bird's head entire. But what was the Doctor's astonishment to find a black pin, such a pin as ladies use in pinning their dresses. This was something new in a naturalist's experience, though had it been found in the crop of a domestic fowl the thing would not have seemed so strange. But now had the creature devoured a lady and found it hard to digest some of her pins? Here, however, the Doctor's mind was soon set at rest. His friend told him that in baiting the trap to catch the hawk a dead snowbird had been used. "And that to make the bait look natural a black pin had been thrust down through the back of the head and through the neck into the body to make the bait hold its head up." This pin the hawk, in his voracity, had swallowed. But perhaps a more singular thing is, that after the hawk had been caught by one claw in the trap, he should still have persisted in eating the bird, and swallowed the head whole.—A. H. G. (Scarborough, N. Y.).

BREEDING OF SQUIRRELS.—*Editor Forest and Stream:* I see in the last two FOREST AND STREAMS statements of squirrels breeding in autumn as if it were something unusual. When I was a boy I shot gray squirrels with an old Kentucky rifle full-stocked (what was left of it), loose in the lock, loose all over, and ran ninety to the pound. But it would put its bullet where you aimed it every time, and many a squirrel have I dropped with a hole through its head. That was in Ohio, and the point is, that we expected to find young squirrels in September about as much as in June; and many a young squirrel have I shot in the hazy days of the delightful Indian summer, when the hickories were loaded with nuts, and the sound of the dropping hulls and shells told too plainly where the nimble rodents were enjoying their breakfasts. It was an accepted fact that gray squirrels breed twice a year, and I was surprised when I saw that it was new to some of your correspondents.—S.

ADIRONDACK WINTER NOTES.—Thus far our winter has been favorable to the game. Deer are still roaming as they please. Partridges can get good feed, and as everything indicates an early spring, I think the prospects good for the season of 1884. I have seen no signs of the larger animals called wild; only one lynx crossed the clearing two weeks ago. No signs of bear nor cat, and no signs of wolves for the last five seasons. We have great numbers of the winter birds about the buildings; crossbills, snow buntings, finches, bluejays, and a little bird of the size and plumage of the goldfinch, who also has his note. I have not thought best to kill one to decide who he is, as I am too glad to see him about the door. Have heard only one owl during the winter; one of the small ones who came out before our last thaw.—A. R. FULLER (Meacham Lake, Adirondacks, February, 1884).

BUTCHER'S WORK.—St. Albans, Vt., Feb. 11.—Some weeks ago, I found in a thicket what appeared to be the remains of a finch. The bird was suspended by the neck in a crotch, and the back of its head and its brain were wanting. I thought it might possibly be the work of the great northern shrike. At any rate, the bird was hung up in a very butcher-like manner. I have known several instances of the shrike's breeding in this vicinity.—J. [No doubt the work of a shrike.]

QUAIL IN CONFINEMENT.—Mr. J. B. Battelle, of Toledo, O., has received from Tennessee a number of quail. He will domesticate them and, we understand, try to breed the birds in confinement.

THE ENGLISH SPARROW.

THE following circular concerning the proposed investigation of the English sparrow explains itself:

The American Ornithologists' Union, an organization resembling the British association of similar name, and including in its active membership the most prominent ornithologists of the United States and Canada, purposes, among other objects already engaging its attention, to determine as nearly as possible the true status in America of the European house-sparrow (*Passer domesticus*), commonly known as the English sparrow, in so far as the relations of this bird to mankind are concerned. The Union hopes to secure through the solicited testimony of others, as well as the personal observations of its members, the facts necessary to settle the question of the eligibility or ineligibility of this sparrow as a naturalized resident of this country.

The question of the European house-sparrow in America is regarded as one of great economic consequence, to be determined primarily by ascertaining whether this bird be, upon the whole, directly or indirectly, injurious or beneficial to agriculture and horticulture. Its economic relations depend directly and mainly upon the nature of its food; indirectly upon the effect, if any, which its presence may have on useful native birds and beneficial insects.

The accompanying formula of questions is respectfully submitted to the attention of those who may be able and willing to record statements of positive fact and value derived from their own experience. Concise and unquestionable answers returned to the undersigned on inclosed blank, or otherwise, or communicated to any member of the committee will be appreciated and prove of high value among the data upon which it is hoped that this vexed question may be set at rest. The evidence thus obtained will be carefully considered by the committee in preparing its report to the council of the Union, and a digest of the same, with recommendations, if any, will be submitted by the council to the mature judgment of the Union at its next annual meeting.

The following named active members of the Union were at the first congress appointed a committee to investigate and report upon this subject:

Dr. J. B. Holder, of New York, Chairman; Mr. Eugene B. Bicknell, of New York; Mr. H. A. Purdie, of Boston, Mass.; Mr. Nathan Clifford Brown, of Portland, Me.; Mr. Montague Chamberlain, of St. John, New Brunswick; the committee having the power of increasing its membership at its discretion. Dr. J. B. Holder, Chairman,

(American Museum of Natural History, Central Park, N. Y. City.)
New York, February 2, 1884.

The appended list of questions show very clearly the character of the information desired:

1. Is the European house sparrow (*Passer domesticus*) known in your neighborhood, and if so, about when did it appear?
2. Is your neighborhood city, suburbs or country?
3. Is this sparrow abundant?
4. Is it increasing in numbers?
5. How many broods and young, yearly, to a pair?
6. Is this sparrow protected by law?
7. Is it artificially fed and housed?
8. Does it molest, drive away or diminish the numbers of native birds?
9. If so, what species?
10. Does this sparrow injure shade, fruit or ornamental trees?
11. Does it attack or injure garden fruits and vegetables?
12. Does it injure grain crops?
13. Is it an insect eater or a seed eater?
14. What insects, if any, are chiefly eaten by this sparrow?
15. What is the principal food it carries to its young?
16. What insects, if any, are carried by it to its young?
17. Does the food of the old bird vary with the seasons, and if so, in what way?
18. Does the food of its young vary, and if so, how?
19. If any insects are eaten, are they beneficial or injurious species?
20. Does this sparrow eat the larvæ of the vapourer moth (*Orgyia leucostigma*)?
21. Does it eat ichneumon flies?
22. Do you determine the nature of this bird's food and that furnished by it to its young by inference, direct observation or dissection?
23. Have any injurious insects been exterminated or materially lessened in numbers by this sparrow?
24. Have any injurious insects increased in numbers, or appeared where unknown before, in consequence of the destruction of other insects by this sparrow?
25. Have these sparrows in your neighborhood been destroyed systematically or otherwise, and if so, by what means?
26. What bounty, if any, has been offered for their destruction?
27. What is the general sentiment or balance of public opinion respecting the European house sparrow in your locality?
28. On the whole, in your judgment, is this sparrow an eligible or ineligible species in this country?

FUR QUOTATIONS.

THE following prices, for prime skins only, according to size, color and quality, as realized by the New York commission merchants, have been furnished by Messrs. Wm. Macnaughtan's Sons, commission merchants, No. 3 Howard street, New York:

Antelope—North America, raw, ₱ lb	$ 30@ 35
Dressed, as to quality, ₱ lb	1 00@ 1 25
Deer—Florida, raw, ₱ lb	30@ 40
Rocky Mountain, raw, ₱ lb	30@ 35
Pacific Coast, raw, ₱ lb	25@ 30
Elk—Pacific Coast hides, ₱ lb	20@ 30
Western skins, ₱ lb	25@ 30
Dressed, as to quality, ₱ lb	80@ 1 00
Mountain Deer—Western, ₱ lb	20@ 25
Reindeer—American, raw, ₱ lb	30@ 35
Dressed, as to quality	80@ 1 00
Beaver—Labrador, large	8 00@10 00
Lake Superior and Canada, large	6 00@ 8 00
Upper Missouri, large	5 00@ 7 00
Southern, large	3 00@ 5 00
Badger—American, large and full furred, each	80@ 1 00
Bear—Hudson's Bay, black, large, each	15 00@30 00
United States, brown, large, each	7 00@10 00
Southern U. S., black, large, each	7 00@10 00
Cubs from ½ to ⅔ of the above.	
Buffalo robes, in bulk	8 00@10 00
Buckskin—Western, ₱ lb	1 00@ 1 25
Pacific Coast, ₱ lb	1 25@ 1 75
Cat—Wild, each	40@ 60
House, each	10@ 30

Game Bag and Gun.

THE LAW AGAINST SPRING SHOOTING.

Editor Forest and Stream:

The long period of murky weather we have lately had started the woodcock and snipe to migrate from the south, and I have heard of quite a number having dropped in about Philadelphia and the near counties of New Jersey. The cold snap coming on us at the present time, although not severe, will cause our early visitors to seek springy spots as the ground has hardened again, and in ordinary places cannot be punctured by the bill of either woodcock or snipe.

Friends who were near Absecom, N. J., fitting up a new club house, last week, told me they started a few Wilson's snipe on the fresh meadows bordering the salt marshes near that place, and I have every reason to believe their report. Of course the bulk of birds will delay their coming until the weather is fairly settled and the frost is entirely out of the ground, but I think we will have poor snipe shooting this spring with us, for the reason that the birds will not in any great numbers migrate our way, but be attracted west of us. The vast extent of country inundated by the late overflow of western rivers will create most excellent feeding grounds when the waters have subsided to their normal condition, and the snipe will most surely seek them, and the migrations of the great body of birds will be to the west of the Alleghenies Mountains on their way north. These inundated and, as it were, irrigated regions, will produce during the coming summer a rank and heavy growth of vegetation, and cause the grounds to be unfavorable for snipe, and we no doubt will be benefited by the birds returning to the south more directly passing our way on the Atlantic coast, thus allowing us the better to make their acquaintance.

Sprigtail ducks are plentiful in our bay and river. Mr. Milburn has returned from a trip to-day with an excellent showing. On both the New Jersey and Delaware State shores of the Delaware, the flats and marshes at low water are thronged with marsh ducks of all the varieties. The snow geese still remain in their favorite locality below Bombay Hook, and use the marshes there regularly. A few have been seen as high up as Port Penn, and a pair killed there. An albino mallard, or black duck—it is difficult to decide which—was shot near Chester, Pa., by a local gunner, who has brought it to John Krider, Philadelphia, for mounting.

We are all hoping the States of New York, New Jersey and Delaware will pass a similar law relative to the web-footed game as our State did at the last session of its Legislature, and that we will soon have throughout the entire land the protection of all game in the spring. As yet the law applying to duck shooting in our State does not go into effect on the Delawnre, but applies only to inland waters, owing to the fact that our neighboring State across the river has not adopted a similar one. As soon as New Jersey passes such an act there will be perfect protection for fowl in the spring; or, I should say, there will be a law providing for the protection of wildfowl, if it is ever carried into effect. We have, however, enough faith in the West Jersey Game Protective Association to believe it will see to the enforcement of all laws which come under its jurisdiction.

Spring appears to be near upon us, already shad fishermen are overhauling their gilling nets, and from talks with the weatherwise ones among them we are expected to have an early opening; but "one swallow does not make a summer."

Philadelphia, Feb. 16. Homo.

UNIFORM NEW ENGLAND LAWS.

WE give below the draft of the proposed uniform game law, which was adopted at Boston by a convention of representatives from the New England States. The movement is due to the efforts of the Massachusetts Fish and Game Protective Association, and at the meeting the following Commissioners were present: Maine—Hon. E. M. Stillwell, Henry O. Stanley, J. H. Kimball; New Hampshire—E. B. Hodges, Edward Spaulding, Luther Hayes; Vermont—Hiram Cutting, Herbert Brainerd; Massachusetts—E. A. Brackett, Hon. E. A. Lathrop, Prof. H. W. Putnam; Rhode Island—Alfred A. Reed, John H. Borden, Newton Dexter; Connecticut—Dr. W. M. Hudson, Robert G. Pike, George N. Woodruff. Among the invited guests were His Excellency Gov. Robinson, Hon. George A. Bruce, president of the Senate; Charles V. Whitten, chairman of the Board of Aldermen; Rev. E. A. Horton, Hon. Chas. Levi Woodbury, Augustus Whittemore, president Boston Merchants' Association, and Wallace F. Robinson, president Produce Exchange.

The provisions adopted were as follows:

Section 1. It shall be unlawful to wilfully take or kill any woodcock, or ruffed grouse, commonly called partridge, or any quail, between Jan. 1 and Sept. 15 following, within the limits of this commonwealth.

Sec. 2. It shall be unlawful to buy, sell, offer for sale or have in possession any woodcock, or any ruffed grouse, commonly called partridge, or any quail, between Jan. 1 and Sept. 15 following, wherever or whenever the birds aforesaid may have been taken or killed.

Sec. 3. It shall be unlawful to wilfully take or kill any wood or summer duck, black-duck or teal between April 1 and Sept. 1 following.

Sec. 4. It shall be unlawful to take or kill any plover, snipe, sandpiper, rail or any of the so-called marsh, beach or shore birds, except Wilson snipe, between April 1 and July 1 following.

Sec. 5. It shall be unlawful to wilfully take or kill any pinnated grouse, commonly called prairie chicken or heath hen, between Jan. 1 and Sept. 15 following.

Sec. 6. It shall be unlawful to wilfully take or kill any wild or passenger pigeon, Carolina or turtle dove, herring gull, tern, sea swallow, or mackerel gull, between April 1 and Sept. 1.

Sec. 7. Any person violating any of the provisions of the preceding sections of this chapter shall be punished by a fine of $20 for every bird taken, killed, bought, sold, had in possession or offered for sale in violation of the provisions of this act.

Sec. 8. Whoever takes or kills any domesticated bird not named in the preceding sections, except birds of prey, crows, crow blackbirds, English sparrows, jays, wild geese, herons, bitterns, and such fresh water and sea fowl as are not named in the preceding sections, or wilfully destroys, disturbs, or takes a nest of eggs of any undomesticated birds, except birds of prey, crows, crow blackbirds, English sparrows and jays, shall be punished by a fine of $10 for every such offense; provided any person above the age of sixteen years having a certificate from the board of commissioners of inland fisheries and game, to the effect that said person is engaged in the scientific study of ornithology, may take the nest or eggs of, or at any season of the year may take or kill any undomesticated birds, except those named in section 1.

Sec. 9. Whoever hunts, chases or kills a deer within the counties of Plymouth or Barnstable between Dec. 1 and Nov. 1 following, shall be punished by a fine of $100 for every such offense; and whoever in said counties at any times hunts or chases a deer with a hound or with any dog weighing more than 25 pounds, or hunts or kills a deer in any pond or river or within 100 yards thereof, shall be punished by a fine of $100 for every such offense.

Sec. 10. Whoever takes or kills a gray squirrel, hare or rabbit between March 1 and Sept. 15 following, shall be punished by a fine of $10 for every such offense.

Sec. 11. Whoever at any season of the year takes, kills or destroys a game bird, hare or rabbit by means of a trap, snare, net or springs, or by the use of a ferret, or whoever for the purpose of taking or killing a game bird, hare or rabbit, constructs or sets any trap, snare, net or springs, or uses a ferret, or whoever shoots at or kills any wild fowl or any of the so-called shore, marsh or beach birds, with or by the use of a battery, swivel or pivot gun, or by the use of a torch, jack or artificial light, shall be punished by a fine of $20 for every such offense.

Sec. 12. The possession of any deer, or of any of the birds or animals mentioned as protected in sections 3, 4, 5, 6, 8 and 10 of this chapter, during the time in which the killing or taking of the same is forbidden, shall be prima facie evidence of the unlawful killing of the same.

Sec. 13. The commissioners of inland fisheries shall have authority to act as game commissioners also and their authority shall extend to the protection and preservation of game birds and animals in like manner as to fishes.

Sec. 14. It shall be the duty of every officer qualified to serve criminal processes to arrest without warrant any person whom they shall find violating any of the provisions of this act, and bring such offender before a magistrate. Any officer neglecting or refusing diligently to enforce the provisions of this act, upon proper information and complaint, shall be punished by fine or imprisonment, or both.

Sec. 15. Any justice or magistrate on receiving proof, or having reasonable cause for believing in the concealment of any game mentioned in this act during the time the possession of such game is prohibited, shall issue his search warrant, and cause search to be made in any market, store or other building, except dwelling houses, or in any boat, car or vehicle of any description whatever; and for that end may cause any apartment, chest, locker, box, crate, basket or package of whatever nature to be broken open and the contents examined.

Sec. 16. All fines accruing under this act shall be paid one-half to the complainant and one-half to the city or town wherein the offense is committed.

Sec. 17. Chap. 92 of the Public Statutes, chap. 199 of the acts of 1882, chap. 169 of the acts of 1883, and all acts and parts of acts inconsistent herewith, are hereby repealed.

Secs. 4, 7, 9 and 13 were recommitted to the Massachusetts Fish and Game Association for amendment; the rest were adopted for presenting to the Legislatures of the New England States as early as possible.

The matter of fish laws was taken up, and it was voted that the closed time for lobsters should be from Aug. 15 to Sept. 15, and no lobster less than twelve inches should be sold.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I notice, in your issue of Jan. 24, an article on the "Performance of Shotguns," signed "Backwoods," and what he says in relation to the effectiveness of the "muzzleloader" over the new fangled "breechloader," corresponds with my experience exactly.

I own a muzzleloader that was bought in New York city in 1849, for the sum of $60, and a better shooter no man ever carried. I have killed a single dove seventy yards with No. 7 shot, and many squirrels in the tops of the tallest cypress trees in our swamps, have fallen victims of its unfailing power. The gentleman from whom my father bought it (in 1855) told me that he had killed a buck with it 125 yards, using common buckshot for his load. The charge was one dram of powder and thirteen buckshot. Now where is the breechloader that can make such a record as this?

The barrels are worn as thin as a knife-blade at the muzzle, and within the past year it has, for the first time, shown signs of failing. It is a 13-bore, 32-inch, weighs nine pounds. Can you suggest a plan whereby I can thoroughly clean and resmooth the barrels? If this could be done, I think it will shoot as good as ever.

What I want, is a gun that I can kill a quail or dove with No. 8 shot, sixty yards, or seventy if need be, and a breech loader, chokebored or not, will not do it. At least I have never seen one that would, although my experience is limited. Ogeechee.

Wadley, Ga.

Editor Forest and Stream:

I notice in your issue of Jan. 24 an inquiry as to the respective shooting qualities of the muzzle and breechloading gun. I thought that question had been unanimously, so far as shotguns were concerned, settled in favor of the breech loader, but I see that away down in Virginia there is yet a "doubting Thomas" on this subject. In answer to his inquiry as to the proper performance of a good breechloader I would say that at forty yards, with 1¼ ounces of No. 6 shot (Tatham's 400 to the ounce) and 5 drams of powder, a good 10-gauge gun should put from 375 to 440 pellets in a 30-inch circle, with penetration equal, if not superior, to any muzzleloader it has ever been my fortune to experiment with. I do not believe that there ever was a muzzleloader made, no matter how carefully bored, that would give the same pattern and penetration as a chokebored breechloader. I do believe, however, that a greater quantity of powder must be used in the breechloader to get equal results in penetration with a muzzleloader, in guns of equal bore and the same weight of shot. Oct.

Editor Forest and Stream:

I have made some tests and trials that have been both satisfactory and beneficial to myself. Last fall, before the opening of the season, I purchased an entire new outfit. The gun was the latest improved arm of one of our most prominent American makers; a .12-30-7½ modified choke.

The pattern of this gun, as it came from the maker, was

very good, but did not quite suit me, so I set me about to improve it. As every one knows, the only means of securing a good pattern is by repeated trials at target, at different distances, different amounts and kinds of ammunition and different manners of loading shells. Never having seen a target for such practice, I made my own. In the center of a large sheet of paper, I drew a two-inch circle and colored it, then circle after circle, an inch between, until the diameter of the outside circle reached 24 inches. The distances shot at the above target were 45, 50 and 60 yards.

After repeated trials, I found the proper charge to be 3¼ drams Orange ducking powder to 1⅛ ounces of No. 8 Le Roy shot, with two best pink-edge wads resting firmly on powder, and a light cardboard wad on shot.

With the above charge, my best patterns at 45 yards (strict measurement) were 163, 165 and 167 pellets within the 24-inch circle, placing 2, 3 and 4 pellets within the 2-inch center.

My experiments with greater charges at same target, but at greater distances, were equally as good.

I also find that this gun will shoot B, BB and buckshot sufficiently well for any purpose. I should be pleased to hear the result of such trials as others may have made.

PENNSYLVANIA. FARMER.

Editor Forest and Stream:

In FOREST AND STREAM of Feb. 7, a correspondent from Vermont says, that in his experience the muzzleloader makes better pattern and penetration at long range than the breechloader. My experience is just the opposite, and decidedly in favor of the breechloader. I have not owned one of the former for a number of years, but of the latter, I have had and tried at targets as many, probably, as any one in this State, and in every instance I have beaten the muzzleloaders.

There is a heavy muzzleloader of 6-gauge and 12 pounds weight owned near here; this gun was said to be a wonderful shooter. One day I shot a 9½ pounds, 10-gauge Daly breechloader against it, each gun being loaded with 1¼ ounces shot. The big gun was so badly beaten at the first trial that its owner refused to continue shooting, saying that his gun had fallen off very much in its shooting qualities, although before the trial he was very confident of success.

Nearly all the guns in this vicinity are muzzleloaders, and if the statements of the owners can be relied upon, they (like the wonderful Zulu gun advertised in some of the country papers, and sold for the high price of $5.00) will kill at any distance from 5 to 150 yards. The shooters about here, with few exceptions, use very large shot for all kinds of game, and occasionally kill a hawk or crow at 80 or 90 yards, and without measuring the distance, they afterward declare that their guns are good for twenty-five rods every time. I saw the owner of one of these guns shoot a squirrel not over forty yards distant, and he afterward insisted that he killed it at fifteen rods.

Your correspondent speaks of shooting foxes. I think I kill as many of them as any one, considering the number of shots, so far this winter, using a 10-gauge 9-pound 10-ounce Scott premier hammerless. I have killed nine foxes—every one I have shot at—and in only one instance have used the second barrel. The distances have been from twenty-five to seventy yards. This gun, however, is the best shooting breechloader, for pattern and penetration, that I have ever owned. At forty yards, with 4½ drams powder and 1⅛ ounces Tatham's No. 3 chilled shot, it puts from sixty-five to seventy-two pellets in a 12-inch square.

If your correspondent ever indulges in trap-shooting, and will attend one of the shooting matches of the Boston Gun Club, on their grounds at Wellington, Mass., I will meet him there and shoot my hammerless Scott breechloader against the best muzzleloader he can find in the Green Mountain State, at any reasonable number of straight away clay-pigeons, at distances from twenty to forty yards rise, for fun or money, each gun to be limited to 1¼ ounces shot. Should he not wish to shoot himself, this is open to any resident of his or this State, barring professionals.

C. M. STARK.

DUNBARTON, N. H., Feb. 11, 1884.

Editor Forest and Stream:

I am glad to see in your last issue, of the 7th inst., that several of your correspondents are as anxious as myself to know practically what our modern breechloading shotguns will do.

Now, I am well aware that there are published tables of records of some guns of particular manufacture, and am equally aware of like tables published by some former writers on such subjects, "Frank Forester" for instance. Yet of all the guns I have handled (and they have been no inconsiderable number) I have shot very few indeed that came up to this theoretical scratch, so to speak, and of breechloaders, in my experience, not one in twenty will do it.

Like your correspondent, "Buckeye," I have been much interested in the discussion of hunting rifles (I do not claim to be a rifleman, yet I have used them just enough, as "the boys" say, "to keep my hand in"). My favorite weapon from my boyhood up has been the shotgun. I may here remark that the rapid extermination of all the larger carnivora and dangerous animals, except in the remotest localities, renders the pursuit of field sports one confined almost exclusively to that commonly pursued with the shotgun.

Now, while we are all striving to attain the same end—the obtaining of the best and most suitable arm for a given purpose—let us by all means have the record and testimony of practical performance.

I can add my mite and affirmation to the truth of a remark made in that admirable work, "The Sportsmen's Gazetteer" by Mr. Hallock, "that, after a most crucial test, the advocates of the chokebore are not satisfied as to results." No, gentlemen; many of the acquaintances of your correspondent are not satisfied. It may be advocated as an advancement to trade and the demands of fashion, and, I may add, that unexplainable feature in human character that is constantly demanding something new; but many of us demand also a mixture of practical utility with the new, at least in the BACKWOODS.

BEVERLY, West Virginia.

[The comparison of the muzzleloader and the breechloader is a dead issue. The muzzleloader is the gun of the past; the breechloader the arm of the present and future. More to the point than a discussion of muzzle vs. breech would be relations of experiments and tests in loading to secure pattern and penetration. There is no question of the breechloader's good qualities. Ineffectual results very probably follow from incorrect loading. We think that some hints on this point would prove of real service to a vast number of sportsmen, and shall be glad to have communications on the subject.]

NEW YORK ASSOCIATION.—The parlor at Pinard's was occupied last Monday evening by the members of the New York Association for the Protection of Game. There was a large attendance, among others Vice-President B. T. Ludington, Fayette S. Giles, Wisner H. Townsend, Wakeman Holberton, J. Harson Rhoades, Henry T. Carey, Thomas N. Cuthbert and Henry N. Munn. Messrs. David W. Judd, W. W. Heaton and W. B. Dickerman were elected to membership and the resignation of Eugene Schieffelin was accepted. A letter from Seth Green instructed the members of the association to distinguish the sex of brook trout. Mr. Fayette S. Giles was directed, by vote of the association, to attend the meeting at Delmonico's on the subject of protecting the Adirondack forests. Mr. J. H. Goodwin, Jr., the official game protector for this city, reported upon his doings in repressing the violations of the game laws. One member said that to his knowledge quail and partridge had been served at the Manhattan Club within the past few days. Another member said he had seen quail served at a Fulton street restaurant recently and within the close season. A third member said that on the previous evening he had seen over fifty quail served at a regular table d'hôte dinner. The counsel of the board was instructed to make an example of some prominent club or restaurant instead of continuing his efforts to street hucksters and minor dealers. Mr. Godwin said that his main trouble now was with striped bass, which were sent to the market from a distance, and with lobsters which were brought to market while entirely under weight. Mr. Munn spoke earnestly in favor of so amending the game laws as to prohibit the shipping through the State of any game when out of season. It was not enough to make it unlawful to kill birds in this State. Something should be done to prevent this city and Boston from being open markets for the disposition of the out-of-season game. Mr. Munn also called attention to the trapping of game, especially on Long Island, where the brakemen and others on the railroads bought the birds and sold them in the city. A resolution was passed asking the railroad authorities to check the practice.

WILDFOWL ON THE PACIFIC COAST.—East Portland, Oregon, Feb. 10.—What has become of the canvas-back this season? I have been living in Oregon twenty-seven years, and always found plenty of them on the Columbia bottoms from November to April. Have killed from fifty to eighty several times in one hunt. They are also very scarce in California this season. The climate is dryer than I ever knew it at this time of the year. There seems to be the usual flight of mallard, widgeon and other ducks, but no canvas to amount to anything. What few come, leave in a few days. The lakes are thick with what the Indians call wappatoo, about like small potatoes, which are very sweet and have always been favorite food for canvas-back ducks. I can not account for it, unless they have taken this season some other direction for their feeding ground. The geese this season, which always are so plentiful during November, took some other direction in their flight from the north last fall. I wish some of your subscribers will please state through your columns if there is the same scarcity of birds in their favorite localities.—T. H. P.

FISHER'S ISLAND.—A consignment of 130 quail has been received by the secretary of Fisher's Island Club, to be put out on their island as soon as the weather allows it. More birds are on the way and the club has contracted for six hundred birds in all, intending to turn loose about this same number every spring. These quail are western birds, large and healthy, and can be inspected at the residence of MAX WENZEL, 89 Fourth street, Hoboken, N. J. A *Herald* reporter announces that the Fisher's Island fresh-water ponds "are to be stocked with fish, partly to afford angling to the club men, but mainly to attract waterfowl." Wherein the said reporter is manifestly muddled.

MEDINA GUN CLUB.—Medina, N. Y.—The Medina Gun Club has been organized by the election of the following officers: President, C. F. Hurd; Vice-President, Fred Mead; Secretary, Harvey L. James, M. D.; Treasurer, A. F. Ellicott; Directors, Aaron Shisler, Frank Barker, A. A. Smith. The object of the association is the enforcement of the laws regarding illegal killing of game out of season and for the mutual benefit and pleasure derived from the meetings of the members. Bi-weekly meetings will be held and glass ball shoots indulged in. The membership now numbers seventeen, which, it is anticipated, will be increased to twenty-five or thirty.

WISCONSIN AND MICHIGAN.—Mr. H. F. Whitcomb, of Milwaukee, general passenger agent of the M. L. S. & W. R. R., will shortly publish a guide and map of Northern Michigan and Wisconsin. The map will be of such detail that it will very materially aid sportsmen to find their ways to the lakes and streams of that charming country.

GEORGIA.—Macon, Ga., Feb. 11.—The recent two weeks of April-like weather has affected our shooting, small bags being the result. Both man and dog suffer in walking and make failures as to numbers. I was out on Saturday with two others and we killed only twenty-one Bob Whites.—J. H. J.

KANSAS.—Morantown, Kan., Feb. 4.—The ground hog saw his shadow on the 2d inst. Robins, crows, ducks, and large numbers of geese have arrived here from Texas. The grass has started in the low grounds, and all nature seems to be rejoicing. Lots of quail and pinnated grouse left over.

BRINDEAU, the famous sporting fop, had a costume for every kind of game that he had shot at. One day, invited to the Duke of Orleans's shooting party, the Duke drew his attention to a hare, suggesting he should fire. "I cannot, monseigneur; I am in my partridge toilet," he replied.

MORICHES BAY.—State Game Protector George W. Whitaker, of Southampton, Long Island, offers fifty dollars reward for such information as will lead to the conviction of any person or persons pursuing wild duck, geese or brant after sunset, or with light or lantern in Moriches Bay.

A man by the name of Taylor, who has a ranch six miles west of the head of Cattle Creek, in Colorado, is building an enclosure, which will contain over 3,000 acres, for the purpose of raising deer and elk for the Eastern market, as curiosities for parks, etc. The fence is to be sixteen feet high. He expects to complete the park by next fall, in time to catch the deer and elk as they come from the mountains. He will leave gates over the trails and is confident he can catch all he wants. Mr. Taylor says young elk or deer will sell readily in the East for $100.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Alas! that every one cannot be pleased! Alas! that in rifles, as in everything else, we cannot have in one arm all the elements desirable in a hunting gun, and alas! again, that target rifles, gallery rifles, long-range, short-range, light-ball, heavy-ball, express, non-express, squirrel rifles, tiger guns, elephant rifles, magazine rifles and singleloaders cannot all be "assimilated," and one rifle evolved which will suit for all and for everything, from the smallest to the biggest game, for the house-gallery practice so many like, and the long-range target shooting so many are fond of. Truly, so long as mail lives, tastes will differ, and gun-makers, as well as others, will have their hands full trying to suit each individual taste, so many not being satisfied with a compromise.

The .40-90-300 magazine rifle, first proposed by me to the manufacturers, and mentioned in my letter published by you Sept. 13, 1883, and from which all this discussion has sprung, was proposed as a "compromise gun," to contain as many of the elements desirable in a hunting gun as might be possible in one gun, and to answer the strictures on "breechloaders" contained in the numerous letters of Major Merrill, who, by the way, has not answered the above-mentioned letter. It was not proposed to construct a "bone-breaker" or a "smasher," as there are already enough of such guns now on the market, but to try to construct a gun that would throw a naked bullet in as flat a trajectory as possible, and unite with this quality great killing power, accuracy of shooting, ease of manipulation, rapidity of fire, and safety to the shooter, together with as great a range of game that might be killed by it as might be possible.

The .40-caliber was selected as a "compromise" between heavy and light caliber. Many like to shoot small caliber rifles at target in preference to heavy calibers, while there are, doubtless, many whose only game is that which requires light caliber. For many of these doubtless the .40-caliber is too heavy, as the ball might tear chickens or squirrels too much unless skillfully killed, but to go lower than .40-caliber would be to impair its usefulness at the other end and make it too little effective on the middle class of game. On the other hand it was not thought of as a gun to hunt grizzlies or other dangerous or ferocious game, the hunter who desires such sport being able generally to own more than one rifle or to provide himself with the heavy "bone-breaker" and "paralyzer" necessary for safety to himself in hunting such game. At the same time a gun was sought that would not be wholly non-effective even if by chance one had, for his own safety, to "tackle a grizzly," but that would have the power and number of shots to take care of a cool man in a tight place.

As the original proposer of this gun I am, of course, interested in its success, and all the discussion pro and con. that your paper has contained has been read with much interest. Now that the gun "has been born," and has been tested by so high an authority as Mr. Farrow with such favorable results, let us see what we have:

First—We have a gun whose range of game is greater than that of any .45-caliber rifle, its caliber and ball being small enough for small game and yet its killing power being great enough for elks or buffalo, as witness the favor of the .40-90 Sharps with a great many Western hunters on heavy game, and also witness the success of the .40-caliber military rifle now being experimented with by the British army, whose bore is heavier in foot pounds than the blow of similar rifles of .45-caliber.

Second—we have a gun whose trajectory is as flat as any rifle not especially made as an express—if not fully as flat as those—and one that will obviate the necessity for such close estimation of distances within hunting ranges up to 200 yards. There being but three inches drop at the 200-yard target, when fired with the 100-yard (point blank) sight (Farrow's letter in January 17 number), any game within 200 yards would probably be hit in a deadly spot with the use only of one and that the point blank sight. Or, in other words, we have a rifle whose "dangerous space" has been much prolonged beyond the same space for the general run of .45 or .50 caliber rifles.

Third—We have a gun whose accuracy of fire is as great, if not greater, than that of any other breechloader, one that will shoot where you hold it, and close to the same spot every time without cleaning and with a naked ball. Patched bullets may be used if desired in the same gun for accurate and close target shooting or for special shots in the field. It is true that I have not shot this gun as yet myself, and I therefore am not stating my own experience; but I for one am willing to take Farrow's shooting in preference to my own as a specimen of what the gun can do in the shooting line.

Fourth—We have a magazine gun, which, in spite of the experience of many, is undoubtedly the gun for hunting, and one that contains sufficient ammunition for almost any emergency, and from which shots can be thrown with almost incredible rapidity when necessary. Understand that I—no more than the advocates of the singleloader—do not believe in rapidity of fire as a necessity for the successful hunting and bagging of game. Cool and deliberate shooting from the singleloader will get away with rapid and wild shooting from the magazine gun every time; but times may come, and have come, in the experience of many, when the magazine rifle was a necessity to save one's life, or to bag game badly wounded, but not killed by the first shot, or to assist in the rapid but cool shooting necessary when one wishes to secure meat from a startled herd of elk, when perhaps meat and not fine sport was the question for a hungry crowd depending upon the success of the shooting.

In proper hands the magazine rifle no more conduces to rapid or wild shooting than the singleloader. With skillful hunting one or two shots would probably bag the unsuspicious game, and then the magazine would be at once filled again, to have the full amount in reserve for any emergency, virtually using the gun under such circumstances as a singleloader. In proper hands again no "dead locking" of cartridges in the magazine would ever result; such accidents only showing carelessness and inattention, if not downright stupidity, on the part of those permitting them, the first care of any sportsman, hunter, ranger or soldier being to keep his gun in thoroughly serviceable condition for any and all emergencies.

Fifth—We have a gun whose safety cannot be greatly doubted. It is true that accidents to magazines have happened, but the liability to such accidents has been reduced to a minimum. In this gun the bullet is flattened on the point, not enough to destroy its fine-shooting, but enough to keep the point of the bullet from resting on the primer of the cartridge in front of it in the magazine, and this, with the tight hold of the feeding spring, keeps the shock of the recoil from having any very great liability of producing an explosion in the magazine. Apart from the magazine we have a gun whose breech mechanism is more than amply strong to stand the force of the explosion of the cartridge. Its bolt is held in place by a heavy strut in rear which must break before the bolt can be driven back by any force in the cartridge, and this strut is amply strong to stand any shock to which it may be subjected.

I have the diagram of this mechanism before me, and from it I see that this strut is pivoted on the same screw as that upon which the hammer revolves. It is short and thick and, when the gun is closed, stands leaning slightly from the vertical, and in the right direction to stand the strain—under the rear of the heavy breech block that closes up in rear of the plunger or bolt containing the firing pin. In this this gun differs materially from the Winchester, for example: In the Winchester the whole strain is taken upon a pair of links upon each side of the gun (I have the Winchester diagrams also before me), which links are not in a straight line when the gun is closed, but depend for their stiffness upon their hold upon the pin in the head of the lever; they are held upon this pin by the position of the side plates of the breech frame, these side plates being held in place by screws passing through and through—and should these screws "strip" their threads, or become worn and loose—then the side plates and links may, as they already have done, blow out from the links, slipping off the pin in the lever head and exert side pressure enough to tear off the side plates and then allow the bolt to fly back.

Sixth—We have a gun whose weight and length are not excessive, but with sufficient weight to make the recoil of the 90 grains powder not unpleasant, and with the right length for a "handy" gun, either on foot or horseback, and still have sufficient length for good shooting for the distance required.

Seventh—We have a gun whose ammunition is not bulky or heavy or unreasonably long. Its powder and lead are about as 1 to 3; its bullet is 2½ calibers long, is naked, and has sufficient cannelures to hold lubricant and take the grooves of the rifle properly, and the 300 grains lead has sufficient "staying power" and "remaining velocity" to give a good account of itself at the distances for which it is intended. Being intended for only short or hunting distances proper—say up to 200 or 250 yards—its route, flight, etc., at longer ranges can only be determined after experiment.

It is true we have a "bottle-necked" shell, and this may be objectionable to some; but on the other hand we could not very well have the straight shell of .40-caliber without increasing its length beyond reason, and it also seems to be a fact that the bottle-necked shell gives more force, weight for weight of powder, than the straight shell, while it can be as readily extracted from a clean gun (by which I mean one free from rust or grit, and not one that has not been fired) as the "straight shell," which is not straight at all, but conical.

Having mentioned some of the things we have, let us see what we have not.

First—We have not a light gallery rifle, or one intended for the lightest of game, but it is believed that even this gun could "bark a squirrel" in skillful hands.

Second—We have not a "long-range" target or hunting rifle, but one intended purposely not to be long range, with the 90 powder and

300 lead, but also one perhaps that may be successfully used as such by the adaptation of less powder and more lead, as has already been proposed by me in former letters.

Third—We have not a rifle intended expressly for heavy game shooting, nor as a "bone-braker," "paralyzer," or for grizzlies, tigers or elephants, but a rifle that probably would be able to give a good account of itself even against heavy game, when any emergency arose to make it necessary for the hunter to defend his life.

And generally we have not a gun that is expected to fill all the requirements for a hunting gun against all kinds of game, but a "con promise" that fills the bill for as much as may be for the general hunter or target shot, leaving the specialists either on large or small game, and the long range target or hunting shots to select for themselves from the guns already on the market, or to "evolve" some new gun more suited to their requirements than either this gun or those to be now had elsewhere. And may success attend such "evolution." C. D.

Editor Forest and Stream:

The great length of the shell of course hinders its effective use in rifles like the Winchester or Kennedy, but could not the Spencer be used for that length of cartridge without using too much of the weight and losing too much of the strength, that it would in the Winchester. The only objection to the Spencer is its unhandy manner of loading by withdrawing the spring; now if that could be obviated by merely using an opening like the Winchester, it would, I think, make it the best of actions for the desired .40-90. HAWKEYE.

NORTH GRANVILLE, N. Y.

Editor Forest and Stream:

In September last I provided myself with a Hotchkiss (.45-70), sent it to the factory, had the triggers eased to 3½ pounds pull and put in clean condition generally, and on the 19th of the month started for Southwestern Colorado. I arrived at my son's cattle ranch about the 1st of October. Here I found two friends of the young men who had anticipated my coming and had come over to engage with us in the hunt. They were well skilled. One sported a .40-70 Marlin magazine, and the other a .40-90 (I think a Ballard single breechloader). Of course, I was a "tenderfoot." The glare of the sun so affected my eyes and the high altitude (7,000 feet) my breathing that for a few days I was not of much account. Soon, however, I began to get used to the situation and concluded to venture out, but from long want of experience with a rifle hardly dared then to trust my chances to that weapon. Game, especially deer, was very plenty. I had a good 10-bore, 10½-pound Parker, and cartridges loaded 4½ drams powder and 12 buckshot, 9 to the ounce.

The boys fixed me upon a gentle old mare (which was wonderfully corpulent with grass, and was nursing a four-months colt), the first time I had bestraddle of a horse in nineteen years. Two of the boys, also mounted, started off at the same time at right angles to my line of hunt, and left me to climb a mountain to a plateau about a mile away. On reaching the plateau I hunted around among the scrub oaks for some time without success, and finally concluded I would turn back. I had not proceeded on the back track far when, like a cotton-tail, up jumped a deer not forty yards, running straight away. I leveled the gun, got sight just below the flag and blazed away. The old mare may have dodged a little, but the first thing I knew I was wallowing in the brush, heels up, and a confusion of horse's feet and stirrup straps was disappearing among the scrub oaks. The fact was the old mare had taken in her dimensions to that degree that the cinches were all slack, and bearing a little harder on the off stirrup the saddle turned with me in getting up, adjusting my torn corduroys, and getting my gun in shape, I attempted to trail the mare, but soon lost track. My only course appeared to be to go back and report. I could see nothing but the destruction of the mare and saddle. On reaching the foot of the mountain I met my son and the man who had started with him at the time I did. We returned. I mounted on my son's horse, and in five minutes after getting the track the mare was found quietly picking the grass, without a scratch and nothing broken but one stirrup strap. Of course the saddle, lariats, etc., hung suspended from the emaciated belly of the beast. The deer was also as easily found dead not over fifty yards from where I last saw it. This was the only deer I killed with the shotgun.

I saw so many deer out of range of shot I concluded to go into practice with my Hotchkiss. The first shot I fired from it was at a hawk sitting on a tall pine 130 yards away. Standing on one knee and resting my elbow on the other, I let loose, and the hawk came tumbling down through the branches dead. The shot was a dead center.

The next day, going out with my .40-70 friend, he pointed out to me a large buck lying on an opposite hillside a distance of 80 yards. He gave me the shot. The ball struck in the throat at the point of the jaw, and passed up through the opposite side of the head, tearing out the eye. The next day I concluded to try it, as the fellow went to get married, "afoot and alone." On hunting around a while, I struck fresh tracks in the mud, and on ascending a slight rise, I looked up and before me saw the head of a deer, with ears erect and eyes bulged out from the stand point. I stopped a little, ran to the top of the rise and saw an old doe taking rather a wide circuit 80 yards off, while the tails of two well-grown fawns could be seen bobbing up closer under the hill. I opened fire and gave the old doe two shots, running to the right, when she tacked about and I got in three shots, running to the left when she dropped. I had hit her every time, and each shot was a fatal one. From this time my exhibition of nerve was not so good, scoring many misses, and I must say many good hits considering my long years of inexperience. Five of us in eight days hung up 36 deer, 1 grizzly (silver tip), 1 cinnamon, 2 turkeys and a number of sedge hens, prairie chickens, grouse, jack rabbits, etc., with little hunting, the deer sometimes running within two rods of the cabin door.

Let me now introduce our friend of the .40-90 R. B., who proved the angel of Leadville in the winter of 1878. That year the rush was great to that place, and winter setting in early, found the 6,000 or 8,000 inhabitants with little meat. In their distress R. B. descended on the town with a burro train of thirty asses at a time, loaded with elk. During the winter, he assured me, he killed with his own Sharps rifle 161 elk and many deer, and marketed them in Leadville. He informed me that in his eight years' experience as a Rocky Mountain hunter, he had owned several good guns, but his .40-90 was the strongest shooting gun he had ever seen; and it required the least adjusting of sights. He almost always made his own bullets and reloaded his shells. He assured me that lead alone would upset to about the form of an ordinary haystack and generally turn over, but that with 1-14 tin and well swaged, the balls would go as straight as a gimlet, and the trajectory was very small up to 300 yards, while with his habit of eyeing his sights his point blank was about 125 yards. He got his .40-90 in 1882; and that fall he killed the first seventeen deer he shot at without shooting a second shot at any one of them. While with us, he let us do the most of the shooting, and busied himself about the ranch. During my stay of five weeks he only shot six deer, but they were scored at consecutive shots, and the nearest he came to a miss was when he broke the back of one at 150 yards after sunset.

He thought we were killing too many deer and would not hunt, and soon we all thought so too. When I left, there were about fifty deer hung up to cure. The hams were cut out, then the shoulders, next the rump was severed, the tenderloins taken out and the carcass split. These were rubbed with salt and Mexican chilly. Our best. My opinion is that the missile which presents the largest surface to contact of equal weight, conveys the greatest shock and consequently kills the deadliest, consequently a truncate kills deader than a pointed missile, and a .45 caliber than a .40, provided the missile is driven with force enough to go through. M. R.

NEWARK, N. J.

Editor Forest and Stream:

In your issue of Jan. 24 the articles by J. W. Shurter and J. Duane are very near my ideas on the subject indorsed by my past experience. Mr. Shurter has made a "bullseye." There is a happy medium in all things, but in this world we poor mortals seem inclined to rush to one extreme or the other. It is within the memory of all probably who take any interest in these matters that originally the majority of breechloading rifles were of very large caliber, 50 and more. Now the fashion seems to be to rush to the other extreme, and many advocate .40 and .38 and even .32 caliber. Are we not going too fast? My experience has been that a .44 or .45 ball is superior to a .50-caliber with the same amount of powder. Yet I would not argue that the .50-caliber with enough powder to carry it would not be more destructive; but then there is increased weight, recoil, cost of ammunition, etc., to be considered, without any great gain, for if we can obtain all that is needed in power with an engine of certain horse power, why have a larger one? Therefore, why a large bore rifle if one smaller will do? Methinks I hear some advocate of small bores exclaim, "There, now, we've got him! Why he admits the small bore is best, and why a .44 or .45? Why not a .40?" Softly, my good friend, "too much of a good thing," etc., and too small a bore in a rifle likewise. I think this matter easily adjusted, and am bigoted enough to believe that others will think so, too, when they look at it in their right light.

We can sum up the requirements of those who shoot a rifle for game into two classes—those who want a rifle for grouse, squirrels, turkeys and the like, and those who, though they may not "tackle" anything larger than a deer, want to be prepared for anything they might "run on to." The majority of sportsmen, while they might not be eager to open hostilities with "Old Ephraim," would no doubt feel more contented if the arm they carried were capable of coping successfully with "Eph," if a good opportunity offered. Now, while I do not want to say that the .40-caliber is not the thing, I will ask its advocates if, for the purposes named above, would not a .38 or even a .32-caliber do just as well and cover all required points as regards lightness, slight recoil, handiness (as regards size and weight), ammunition and small cost of same? If such is the case, does not the .44 or .45-caliber more nearly fill the other requirements of a powerful missile than the smaller .40? If these two points are admitted, why the need of the intermediate caliber for all practical purposes? The point has been advanced that the length of the cartridge of the .40-90-500 is against it. I think it well taken, as, aside from the increased length of the action of the rifle, too long a cartridge would be unhandy. By increasing caliber we get increased powder capacity with less length of shell. Then, again, the ball. A 500-grain .40-caliber ball is too long for practical purposes, or at least some of your correspondents so prove; and there is no question but that a ball weighing from 350 to 405 grains (the government ball) would do as good work as the .40-caliber long ball, for what would be gained by length (unless we expect ball to strike sideways) in killing power and for hunting distances, will not the other ball be long enough to have a steady flight.

Let us have a .45-caliber repeater, with 90 to 120 grains of powder, and ball from 350 to 405 grains, straight shell. Then at a "pinch" the government shell could be used as a singleloader. And as most of our heavy game is shot in the West, this fact will cause the rifle to be popular in that section. With such an arm, with an action that will stand the "racket" and always work, the *ne plus ultra* of an all-round sporting rifle will be reached for the present. What the future has in store for us, judging by the improvements in the past, "We dinna ken." PRAIRIE DOG.

DETROIT, Mich.

Editor Forest and Stream:

The men of leisure and means want to have the inside track all the time. They are not satisfied with any reasonable battery, nor willing to take chances with the hunter who can only afford one gun. The cry is for a costlier and deadlier weapon that will kill every thing before it. The big-duck guns were seized and broken up, because forsooth they killed more ducks than the fine-haired city swell could with his Greener, sinkboats, decoys and all. Game protection is right and should have been thought of long ago; yet it should be in spirit what it pretends to be in form—for the preservation of the game, for the benefit of the masses, and not for the favored few. There seems to be an envious under-current in this matter of game protection. Sportsmen who only have a yearly vacation are, of course, anxious to kill all the game possible in a certain limited time. They are to some extent jealous of the gentleman sportsman of means and leisure alike unlimited; and he in turn of the backwoods hunter, who, with the faithful old muzzleloader, kills more than both of them. This is all wrong. The game is not confined by meets and bounds but falls to the man who can stand the toil of tramping day after day, or stand shivering on a runway for hours in the hope of one chance at a fleeing deer. The present hunting rifle is good enough, far too good for our supply of big game. Give the game a little show. Only a little while and game shooting will be a thing of the past. Manufacturers of guns are killing the "goose that lays the golden egg." What would you think of a man carrying a 4-bore, 10-drams powder, 3-ounce shot on quail? Explosive bullet, hollow express balls that cut a deer in two, extreme long-range rifles with "great smashing powers." Though carried on large game, should be classed in the same category as No. 4 on quail—murderous. We won't need guns much longer. 38-LONG.

Editor Forest and Stream:

Whether there is sufficient demand for a .40-90 repeater to justify its manufacture is a question yet to be determined. I, for one rifleman, doubt it.

I have mentioned before the advantages of using in our .45-caliber rifles more powder and less lead. In your issue of Jan. 17, your correspondents W. Milton Farrow and "C. D." mention this.

Mr. Farrow speaks of putting his shots thirty-two inches higher with a .45-85-295 shell than with a .45-70-405 shell from the same rifle.

The government shell can be loaded with 85 to 90 grains powder and a 300-grain ball, and will give about the same result, and for hunting purposes, deer especially, is much more satisfactory. It will catch a deer's back along midrange that the regular ammunition would overshoot. Most of the reloading tools for the government shell will seat a 300-grain ball just as perfectly as the regular ball. I know that the tool formerly manufactured by the Providence Tool Company will. Sportsmen who use the .45-75 bottled shell in their repeaters should by all means try a 300-grain naked ball with all the powder the shell will hold.

This ammunition is so much superior to the 75-350 load, that I believe no deer hunter will return to the latter. Make the balls tolerably hard and they will follow the grooves. By using a 24-inch loading tube, at least 90 grains of Hazard FG powder can be put in this shell, and you will find the balls do go down the range in a hurry. The recoil is but slight, and the blow-out-behind theory is all bosh. Would the shell hold it, I would not hesitate to use 150 grains in my repeater (the new Whitney Kennedy), and believe it would stand much more.

I also find the trajectory of this rifle a little flatter than others in which I have used the same ammunition. I prefer the solid ball, and believe 300 grains heavy enough for all game but buffalo and grizzly. Of the first we have no more, and but few hunters comparatively look after grizzly.

Then again, this ammunition is used in a 9 to 9½ pound gun, which is about as heavy as a man wants to carry all day. I would sight the rifle with the Van Dyke sight (described in his "Still-Hunter"), for 100 yards.

These sights are certainly worth a trial, and any one can make and put them on. BIG INJIN.

DELANA, ILL.

Editor Forest and Stream:

I read with pleasure the article by "Drocidep," in your issue of Jan. 17. I can heartily agree with him in thinking that a .25-caliber would be popular among those who hunt small game. I have been using a .32-caliber Remington, for some time back, but I have long thought that a smaller bullet would answer my purpose just as well, if not better. I think that a .22 is too small and that a .32 is larger than is necessary in hunting small game. H. J. R.

HAMILTON, N. Y.

Editor Forest and Stream:

As it now seems to be in order for sportsmen to express their preference for sporting rifles I wish to suggest still another pattern which, in my opinion, would become a great favorite among that class of sportsmen who have given some attention to glass-ball and wing-shooting with the rifle. I am a believer in the capabilities of many sportsmen to kill birds on the wing with a rifle, and for those who hunt for sport, recreation, and health, and not for "meat," one bird killed in that manner must certainly afford more satisfaction than a dozen killed with a shotgun. Of course considerable practice is required to hit rapidly moving objects with a rifle, but it has been done by hundreds, and can be by thousands more. Where game is plenty sufficient practice can be had with little inconvenience after one has acquired some proficiency at old oyster cans, glass balls, and the like.

The rifle best adapted to this style of shooting, or "snap" shooting as it is called, is the .22-caliber. Now the rifle I want to suggest is a .22-caliber magazine gun with underneath lever action similar to the Winchester or Marlin and shooting the rim fire cartridge, either the short or long will do.

The object is to get two or more shots at single or double balls, or as many as possible at flying or running game without removing the gun from the shoulder.

The .22-caliber rifle is pre-eminently the one for practice and for many kinds of work in the field, and for the following reasons preferable to the larger calibers: First, it is sufficiently accurate for all practical purposes; second, makes little or no report to frighten game; third, no smoke to obscure the vision when a second or third shot is necessary; fourth, does not tear the game into strings; fifth, can be used without danger or without disturbing any one near town, or even in a large city, for target shooting or snap shooting at stationary objects. Only a plank four or six inches thick and a foot square is necessary for a butt and a back yard is sufficient range.

Perhaps the most potent recommendation is the trivial cost of the ammunition, a thousand rounds of the short costing only about $2, the long about $3, while the .32 and .38 caliber center fire cost in the neighborhood of $12 and $15 per thousand respectively. For a person using one or two hundred a day this margin is an important item, unless his bank account is very plethoric. To become expert requires lots of practice, and a person practicing should never be haunted with the feeling that he cannot afford the expense.

In conclusion, the killing power is quite sufficient for all birds like quail, doves, grouse and ducas, and for such animals as squirrels, rabbits, muskrats, badgers, etc. I even know of one instance where a yearling buck, mule deer, was killed with a .22-caliber Remington rifle using the long cartridge. He was shot through the heart at about fifty yards, and, starting to run, received a second shot, which struck his backbone, bringing him to grass. Both bullets in this case passed clear through, making four holes through the skin.

I am very desirous of seeing such a rifle from some of our reliable makers placed on the market, which fact must be my apology for this intrusion on your own and readers' patience. PICTE.

FORT BIDWELL, Cal.

Editor Forest and Stream:

About five years ago I purchased a Sharps mid-range rifle .40 caliber, using the 2½-inches traight shell (65-330) mainly for use on the range, and having no other hunting rifle concluded to try this with the ordinary ammunition. I had no trouble hitting my game at the ordinary hunting distances, but did have about as much difficulty finding my game after being shot as I did to look it up in the first place. About this time the express system began to attract attention. It did not take me long to make up my mind to try the express bullet, and the first one was a 275 grains, which I used a season with good success, only the bullet jammed in cold weather when loading after two or three shots and sometimes I could not get it into the chamber without tearing off the patch. The trouble was that it was too much of a cylinder, and I resolved to have a new mould made, with the bullet tapering more, and of lighter weight. The first was 250 grains, which I afterward reduced to 240 grains, to take the small sized copper tube made by the U. M. C. Co., and I think it the best .40-caliber express bullet made. I use 70 grains powder and lubricating wad, would use 80 or 90 grains if the shells would hold it. With this ammunition I can get excellent targets at 300 yards, and the trajectory is comparatively flat; for a singleshot deer hunting rifle I don't think this can be beat much.

For some years back I have been wishing for a double express rifle, but on account of the heavy import duties kept putting it off till a more convenient season (when the duties would be lower). I happened to be in New York during the International Military Match of 1881 and became acquainted with some members of the British team, among others Mr. McVittie, with whom I had a talk about double express rifles and their makers. On account of his experience with sporting arms, I of course plied him with all manner of questions, pertaining to those arms, which he kindly answered. Among the different makers of repute, he recommended the Messrs. D. & J. Fraser, of Edinburgh, Scotland, very highly as makers of express rifles, and said they were using an improved kind of rifling that very much reduced recoil and fouling, and gave a very flat trajectory. I placed an order with them for a double express .45-caliber, using 110 grains C. & H. powder and 280-grain bullet, which in due time came to hand. They call it a double grip, un er lever, with extension rib, Damascus steel barrels, back action, rebounding locks. The barrels are twenty-eight inches, the whole gun weighing a little less than eight pounds, and when compared with our ten and eleven pound guns it is a seeming toy. The sighting is perfection, if such a thing can be. It seems just as easy to use it in the thickest hemlock woods as in the nicest gray light, and I have yet to see a sportsman who has handled it that was not at once captivated with the sights, and in fact the whole gun. I did not get the gun until late in October, and have not had a full season with it yet, and cannot report fully, but from the few deer I got this fall with it, I am satisfied it will prove a very superior weapon.

Now in regard to the choice of a hunting rifle, I am willing to admit there are some kinds of game where a solid bullet is better than an express, at least I judge so from the tone of many letters from Western correspondents, but for all-round hunting I consider the express system as far in advance of the solid bullet as the breech loader is ahead of the muzzleloader. I have used the solid bullet about ten years and the express about five, and am well convinced that the express system has only to be better understood to be more generally used. D. MCG.

HARRISVILLE, Mich.

Camp Fire Flickerings.

"That reminds me."

104.

FIVE of us went into camp in the Indian Territory, and we drew lots to see who should begin to cook. Dr. B. drew the black bean and cooked a very decent supper an hour after we located camp. Sitting around the fire before bedtime arranging plans for the coming three weeks of camp life, and swapping such glorious shooting and fishing lies as only honest sportsmen know how, the happy thought struck me (what would our lives be without the dear old "happy thought?") that one man should cook till some other fellow found fault, and then the faultfinder should cook till he in turn was found fault with. When I proposed it everybody consented, none more cheerfully than Dr. B., who knew too well what an abominable cook he was and felt sure of being relieved soon. Day after day passed and no word of complaint came from any of us, though the Doctor seemed to take a fiendish delight in serving up such fearful mixtures as made us leave camp sorrowing. Finally, getting desperate at the prospect of spending the rest of his days over the pots and kettles, and believing we had secretly banded together to keep him there till camp life ended, he dumped a quart of salt into the dough for the breakfast bread one morning, and when it came on the table smoking hot he sat back to watch the effect, with a diabolical gleam in his eye. Judge M. was the first man to help himself, and as he swallowed a piece of Dr. B.'s bait he heaved two or three times, and yelled out, "Je-ru-sa-lem crickets! that bread is salt; but, Doctor, its good, don't you forget it." J. W. M.

ST. LOUIS, Mo.

CRITICS' CORNER.

Editor Forest and Stream:

Now that we have a critics' corner and every one is doing a little growling and giving hints, I would like to do my share with the rest. Add to the *Index Expurgatorius* "yanked," or "taken in out of the wet." I also put in a plea for angler instead of fisherman. Though I know of no exact authority for this, yet we all recognize that a fisherman is one who gains his living by fishing and an angler one who fishes for sport. Who ever heard of the "Marblehead cod anglers." And I think we have all tired of such stereotyped expressions as "feathery lure" for fly, the "pliant rod" and others too numerous to mention, but which every reader of angling literature will recognize. Let us strive to attain a simpler, more condensed style and give more facts and less fancy.

If anglers in writing accounts of their trips would give accurate information, as to where they went (unless they wish to keep this a secret), how they got there, where they put up, what sort of accommodations and access to the water they had, what time of year, and what kind of weather it was, what sort of bait or flies they used, the condition, depth, etc., of the water, how many fish they took, and the approximate average weight, the kind of fish and any particular incidents or other details they can give, and necessary expenses, their accounts of their journey would not only be as interesting but very valuable and we would soon accumulate an invaluable mass of information on angling matters, which we now, to a great degree, lack.

PERCEVAL.

Professor Skeat notes in the London *Academy* that in Hoyt and Ward's "Cyclopædia of Practical Quotations" there is at least one which has found its way, with comical effect, into strange company. The words of Pistol in "Henry V." IV., 1.—"Trail'st thou the puissant pike"—are given under the head of "Angling."

Sea and River Fishing.

TROUTING ON THE BIGOSH.

WADING THE STREAM.

THE Colonel drew me to one side and said, "You do not intend to go with the Doctor and wade to-day, do you? I know that you care nothing for wading, more than I do, and I am surprised that you talked of doing it."

"Wading," said I, "is not real enjoyment for me, and perhaps I can do some bank fishing; you know that I agree with you that the height of pleasurable fishing for trout is on a lake or stream, where one can sit on a hard seat until his backbone gets kinked in five or nine different places, and the lower end of it blooms like a cavalryman's, and then to throw the fly near shore in the early season, or into the spring holes later. Yet a change may be a good thing in making one return to his first love. Some one has said that life would be endurable if it were not for its pleasures, and his remark is true in many cases. A coal miner would be happier if he never came out and took a sniff of fresh air, saw the blue sky, and heard the robins pipe, then he would think the mine was his natural place, and would know no better. The sailor after months of hard labor looks to port for a week's carouse as the summit of all human happiness, but must go to sea again."

"Then," interrupted the Colonel, "I may assert that you would be better off in the regular yearly round of your labors than to have a vacation and spend it in fishing with 'we three.'"

"Yes. There are men who claim that a vacation is not only enjoyed but that they return to the treadmill with a zest for it, but with me I confess to a feeling of regret at resuming the harness after a vacation, which passes quickly when in my opinion it should last forever. Therefore there is truth in the saying. Now wading a stream is not so disagreeable, it is a form of pleasure not quite up to boat fishing, but far preferable to no fishing, or to being shut up in an office, or a coal mine, besides our friend, the Doctor, wishes me to go, as you will not, and it would be selfish to deny him a day on the stream because I prefer the lake or the river. I have waded many streams in my younger days, and enjoyed it, my taste has changed in this, but I can still get some pleasure from it. Besides this, the Doctor is an accomplished stream fisher and I can learn from him; he is coming, draw him out and get him to talk on his favorite subject."

"There is no use in whipping a stream unless we can get off in the morning or be on it toward evening," said the Doctor, as he came into camp with his low wading shoes, ready for the fray, "the trout do not usually rise well at mid-day, and it is nearly five now, and will be an hour later before we wet our flies in the stream."

"Do you prefer to wade up or down stream?" asked the Colonel.

"It depends so much on the stream," answered the Doctor, as he sat upon the log upon which the Colonel was resting one foot as he smoked, "that it is impossible to give an intelligent answer in a few words. No doubt it is the most successful and scientific mode to fish up stream, but it is usually most pleasant to fish down. In up-stream fishing a short line only can be used, and as it continually comes back to you it necessitates constant casting. In this case the fish, which always lie with their heads up stream, do not see you so readily, nor are they alarmed by any stirring of the bottom by your boots. This is a question on which anglers are divided. For my part, I prefer to fish with the wind, let it be up or down, because it is discouraging to have a breeze strike you as you turn a bend and bring your line about your ears. In down-stream fishing the current carries your flies where you want them by governing their course with the rod, and there is less exertion. A longer line must be used because the fish can see you better, especially in shallow water, and are conscious of a disturbance in the water by the particles of sediment sent down as you wade. Of course I refer to fly-fishing. If I used a worm I would always fish down stream. If a stream has weedy margins and is swift in the middle, I always fish up stream."

"Why this invariable rule for a weedy stream?"

"Because the trout lie above the weed beds, and as you are effectually hidden from their sight and cast above them, they rise more readily. When hooked keep a taut line on him and keep him clear of the weeds, get the fish below you, into clear water, if possible, and fight it out there."

"Doctor," I interrupted, "it has seemed to me that when I have hooked a fish above me, and it starts down stream, it is a difficult matter to keep a taut line on the fish. With twenty feet of line at least, and the fish rushing down stream, past your legs, and possibly with branches overhead to entangle your tip, I have found this easier to talk about than to do."

"Exactly," acknowleged the Doctor, "I meant to keep the line as taut as you can. When the fish gets past you into a pool or into wider water below, bring the strain on it as soon as possible without tearing the hook from its mouth. A struggling fish in a weedy or snaggy place can often be led into safer water by slacking the strain so as to give him his head and follow, and gently direct his course, so that he thinks he has it all his own way for a while. The fish, when played up stream, plays much lighter and strains the tackle less, and it is most desirable to keep it above you when fishing up stream if you can. It is impossible to lay down inflexible rules for stream fishing, which is the most artistic of all fishing, and requires more knowledge of the habits of fish and changes of tactics to meet the varying moods of the weather. We never find exactly the same conditions on the same stream, and any one desiring to become a successful stream angler must fish at all proper seasons and in all weathers, no matter how disagreeable, for on the worst of days we have good sport. I prefer a clear, lively stream with occasional pools, as there can be found a variety of fishing, such as dapping the flies in the rapids and casting in the pools, but this stream which we propose to visit to-day, and which Jack has already christened the 'Little Bigosh,' promises from all accounts to be dark, sluggish, and overhung with bushes. Cedar logs will no doubt be plenty, and there are usually pools under them which are claimed by large trout which prefer solitude to the company of their own species, which they drive off. In such places a back-handed cast is often necessary in order to reach under the overhanging bushes."

"I should think," said the Colonel, "that it would be difficult to cast in the exact spot where a trout has risen when the water is moving rapidly and the bushes are low."

"The bushes are always to be watched, but the cast must be made a yard or more above the swirl of the trout," answered the Doctor, "for a fish is not so apt to rise to a fly that is behind it, he prefers to meet it. In coming to a deep pool I prefer to cast from the most favorable side to the lower edge at first, and so avoid disturbing the fish lying in the swift water above until I have picked up the stragglers."

During this conversation I had stood all ready for the start, and tried several times to stop the flow of information which the Doctor was pouring out; not that I differed with him, but because at school I had information pumped into me against my will when I would prefer to be fishing, and I have imbibed a dislike for all information.*

The Colonel started in with another question, which, no doubt, would have been followed by a dozen more, had I not pointed to the rising sun just showing above the eastern hills, and called his attention to it by quoting:

"* * * 'tis morn, and jocund day
Stands tiptoe on the misty mountain tops."

The Doctor saw the necessity of action and we started, leaving Jack untangling his line and the Colonel musing on the charms of wading as compared with lake fishing.

FRED MATHER.

* In this truthful narrative I have tried to restrain the Doctor from pouring out his knowledge which, in his case, is the acquirement of a life-time, but when he gets wound up he goes it until run down. I have cut down this chapter lest I be suspected of trying to smuggle in a dissertation on fishing in the guise of a chronicle of a fishing trip. I hope the reader will not suspect me of trying to slip a gilded pill down his gullet, that is peculiarly the province of the Doctor.

LUCK WITH THE LONGNOSES.

ONE fine day last September the Doctor and the writer drew up in front of the barn belonging to the owner of the picnic grounds on the beautiful lake in M. It was 1 o'clock and the horse stood heaving after a long drive. We quickly tumbled out, horse under shelter, traps overhauled, and in five minutes were making our way to the lake.

Arrived at the shore under the shade of a huge old hemlock, we took dinner, such a dinner as only hungry men can enjoy, and washed down with draughts of cold spring water, to take the dusts of the road away.

After dinner, while we discussed a glass of grog and our cigars, we laid out our plans. It was a beautiful day in early autumn. It was warm and fine after some cold rains and a light mist clouded the air, through which the sun shone with a soft light. A gentle breeze rippled the surface of the water. I prophesied luck. Looking at the lake the Doctor said:

"Up through this cove and across that point we used to take some fine bass with the fly in years gone by, when they were first put in."

"Well, we've got the tackle here now, and we will try it again," said I.

All being ready we got aboard our boat, and while the Doctor rowed, I made a number of casts with a whip made up of approved patterns. We also trolled them gently over some fine bass grounds, but never a leap did we see. At length the Doctor grew tired.

"Let us anchor in by that rocky bank and try still-fishing," said he.

By this time the breeze had freshened, and little dancing waves were plashing against the sides of our boat with a musical murmur. It required both anchors down to hold her. We now tried grasshoppers and crickets, and the Doctor amused himself by using a handline also, baited with a worm, in hopes of taking some perch. All was calm and still. The lake looked lonely and deserted; not a boat but our own, nor a human being but ourselves, to be seen. On the opposite side, a quarter of a mile away, where the lake narrowed, the mountains came down steeply to the shore. They were covered with a young growth of timber, whose leaves, mellowed by the heats of summer and touched by the first frost, showed the tints of autumn. Among them the purple red of the ash was conspicuous. Now and then the sweet wild bell-note of the bluejay floated across the lake through the soft mild air. Not another sound to be heard save that and the murmur of the water.

Soothed by the calm beauty of the scene I was fast falling into a drowsy, careless state, when I was roused by the voice of the Doctor, "This will never do. We must not go home without some fish, or we shall be laughed at as unsuccessful anglers."

"Then let us change our place once more. I have had one bite and you none. There are no hungry bass here that is certain," said I.

"We will cross over and anchor just inside that point where the rocks jut out. We will see if there are any bass or perch there. If we have no luck there we will try the pickerel at the upper end of the lake."

While the Doctor was speaking we had lifted our anchors and our little craft was skimming along. The Doctor had the oars and I was artistically trolling a grasshopper of mammoth size astern at the end of about seventy-five feet of line, more to kill time than in hopes of catching anything. Just as we stopped at the proposed place a fish took the grasshopper and struck out for deep water. "If he is a bass he is not very large," said the Doctor, who was putting down the anchor. My rod bent to the strain, but the run was short and I thought the same. I put on a vigorous strain, and in a moment he came alongside and was lifted in, a perch of about a pound's weight, and a very fair size for a perch, too, in that lake. "Well, we are after bigger game than perch, but if we don't catch anything more here, we have at least got the wherewithal to seduce the pickerel," said I.

An occasional perch came to hand, but an hour wore away and no bass. So we lifted anchor and rowed up the lake. We noticed as we went up that the lake had been much lowered by drawing off water for the mills, some ten miles away, to which this lake acted as reservoir. The further up we went the more apparent did this become, until at last we rounded a point, and the end of the lake and also a curious scene lay before us. The whole end of the lake which usually covered many acres and was of a shallow, weedy character, lay bare from the lowering of the water, save where a deep channel ran between the shore and the island. This channel opened up into many little shallow bays in which many gaunt stumps which had before been submerged, lifted their withered arms in the air. The whole extent of the old pickerel grounds had been contracted to a small body of water. The Doctor and I gazed at the scene in astonishment. It had never been so low before.

"Well, let us try it here for a moment, and see if there are any fish left," said the Doctor, dropping the anchor into one of the little bays. My rod was not well adapted to this sort of work, and I was afraid I would strain the tip, but nevertheless, I cut a thin strip of white belly from one of our perch and twined it around a light gang of hooks. Drawing out about thirty feet of line I cast the bait inshore, and in a minute the white lure slowly cut the waves. At the second cast a large pickerel took it savagely, making the water boil as he seized it. I struck, and in a moment he was alongside and trying to get under the boat. Before he could cut up any tricks he was jumping on the bottom of the boat. Meanwhile, the Doctor had a stick and was getting his captive alongside. I fixed my bait and cast again, and in a moment had another savage strike. Having snap tackle I struck him immediately, and the next moment he was in the air shaking his head wickedly, and then made a straight bolt for the boat. I went to lift him in, when he calmly opened his mouth and I only lifted the hooks out, while my friend swam off, looking over his shoulder, and no doubt feeling happy. And here I would like to say that I think an angler loses a larger number of pickerel for a given number of bites than any other fish. I consider a pickerel one of the wiliest fish that swims in the matter of getting off from a hook. He never wastes his time in hard pulling, trying to tear it out by main strength like a bass or trout, but calmly bids his time till he is alongside and you have hold of a short line when, with a sudden and desperate wrench and jump, away he goes. How in the world is it that so many pickerel which have been securely hooked manage to get off? I think it is their very calmness and "loginess," as many writers call it, that deceive you; one thinks that they are all exhausted and played out, and that they are coming tamely to hand, when in reality they are only waiting to get an opportunity to bolt. There is nothing more exciting in angling than the sudden, savage dash with which a large pickerel takes your minnow, and if to this and his craftiness he only added the steady, stubborn fight of the true game fish, he would be called a splendid game fish, and this in spite of his ugly looks and ignoble haunts and associates.

Well, we tried the bay a few moments and then rowed up and drifted down the channel, just far enough distant from the island to make a good cast inshore. The island used to be quite a curiosity. It was not over an acre in extent and made of driftwood, bushes, grasses, etc., held together by a rank growth of aquatic vegetation and used to drift up and down the lake under the influence of the wind. In the last few years it seems to have taken root at the upper end of the lake in the shallow water. Its sides, composed of the roots of bushes, afforded some fine lurking places for pickerel. As we passed along it they bit like mad. At every cast the water boiled with a fresh strike. My light 8-ounce fly-rod was being severely tested. Once as I made a cast an old veteran took the bait with a splash that made the Doctor jump. I struck with nervous energy and the next instant I saw his head and body coming out till he looked as long as my arm. Then with a vicious shake of his head he sent hooks and bait flying. We used up a number of gangs; their sharp teeth cut the lashings through and through till in a short time the gang was useless. We lost a great number, far more than we brought to creel. It seemed impossible to hook them securely. They seemed to "blow out" the bait, as Francis expresses it. It was very irritating, and one fish, a small one, aggravated his crime till I lost all patience and took summary vengeance in a way that made the Doctor shriek with laughter. I made a cast and this little wretch took the bait and allowed me to bring him alongside, when he calmly let go and swam off slowly. The bait was not injured, so I cast it over him as he went. He took it, turning quickly, and the same result followed. I grew provoked; cast again, and again he took it and escaped. I threw after him once more, and I could distinctly see him take the bait about fifteen feet away. This time I laid plans for revenge, if he escaped being hooked. I let him have the bait to gorge for awhile, and in the meantime I got a stretcher from the bottom of the boat. Then I struck him again and led him gently alongside and attempted to lift him quickly in with my left hand. As usual, the hooks and bait came but not the fish. But this time I was ready, and as soon as he let them come out of his mouth I hit him a most tremendous thwack with the stretcher in my right. No doubt he carried a sore spot for some time, and I hope it taught him not to fool with anglers who mean business. Meanwhile, the Doctor was taking it in with screams of delighted laughter.

Moral: Never forget your landing net when you go fishing or you'll be sorry for it.

But now the sinking sun threw long shadows of the neighboring hills upon the water and warned us our time was up and that we should be homeward going. Fain would we have staid for they bit as hard as ever, and we regretted the time we had wasted in the afternoon still-fishing. It seemed as if all the fish in the lake had gathered in that one narrow channel. Though we had been there but an hour, as I rowed homeward the Doctor strung sixteen goodly fish upon a stout cord, besides many we had used as bait and numbers of little ones thrown back as they came to hand.

There is nothing that makes an angler "wend his way homeward" with such self-complacency as a fair string of fish taken in a brief, exciting hour after a long day of unsuccessful fishing.

Rapidly we drove through the gathering dusk, and as the home lights shone out in the valley below us we felt we had ended our luck with the longnoses.

PERCYVAL.

ANGLING FOR CHARITY.

Editor Forest and Stream:

My attention has been drawn to a communication from Chicago in your issue of Jan. 3, entitled "Probable Trout Hoggishness," calling your attention to an extract from a Scottish paper, anent a Mr. George Wilson, M. A. I am sorry that your correspondent should use "bad words" against a gentleman who is an utter stranger to him. My long-time worthy friend, Mr. Wilson, now well on to seventy years of age, is a retired school teacher, who, after thirty years of active service in various parts of the world, finally settled in his native country and county, intending to follow his profession there; and with that intent studied and took out a certificate under the new school laws of Great Britain. Unfortunately for Mr. Wilson's active habits he has never been able to get a school, owing to the strong competition of younger men; and to prevent himself from being eaten up with ennui he fell back on his old pastime of angling. To show you what he does with the fish when caught I will just give an extract or two from one of his letters of January, 1880: "I undertook to supply eleven families with trout. Nine of these families I supplied once a week, the other two I supplied daily, reserving only as many as furnished my own supper." "I never made any charge for the fish which I freely gave away, even when I had not a sufficient supply to meet the demands of my own supper." "On

several occasions, when there was a deficiency, I had to content myself with bare potatoes." "Among the families there were seven old people, four males and three females, the oldest ninety, the youngest seventy-six." This giving away has been Mr. Wilson's constant practice since ever I became acquainted with him, I never knew him to sell a fish. Your correspondent seems to have a suspicion that he was wronging my friend when he prefixes the word "probable" to the offensive term, and I regret that it has found an entrance into your genial journal. T. P. D.

Cargill, Ontario.

THE DOWEL PIN IN FLY-RODS.

Editor Forest and Stream:

Mr. "Couples" has my thanks for his suggestions in reference to the article on "Leaders" in your issue of the 7th. It is hoped soon to give the results of further experiments in that direction, when his suggestions will be considered.

But now missionary labor is in hand.

A short time since a well-known rod maker, while admitting that the use of dowels on the joints of fly-rods, and the excessive length of ferrule necessitated thereby, was a disadvantage, declared that the fault lay not with the makers, but in the prejudice of the buyers, who would not purchase a rod otherwise made.

To combat this prejudice, if it exists, and to provoke that discussion which is the life of progress, are the purposes of this article.

Since the value of an opinion bears some relation to the experience and competency of him who gives it expression, it may not be out of place to say, that for the last twelve years I have made every article I use in fly-fishing, excepting lines and hooks, and including ferrules and rods of almost every attainable material, including 6-strip split bamboos. That I have also made ten quite protracted trips, armed with rods and ferrules so made, to the Rangeley region of Maine and beyond, and have handled therewith many vigorous trout from 7 pounds 2 ounces down.

First—It would seem an elementary principle of fishing lore, that a one-piece rod without any joints whatever, would be the most uniform in action and efficient in use. But convenience of transportation, since it is given to but few to cast the fly except at a distance from home, precludes such a rod. Nevertheless it is the ideal rod, and the nearer it is approached the better will be the result. So far there will be little difference of opinion.

Certainly the chief feature to which the merit of such a rod is due, is the absence of stiff and inelastic places therein. Its bend is uniform from one end to the other. This can be approached in a jointed rod only by reducing the inelastic portions to a minimum; or, in other words, by shortening the ferrules to the utmost extent consistent with safety. If this is so, it is conclusive that the dowelled ferrule is, in this, inferior to one without dowels, since not only must the ferrule itself be longer, but it must be capped at the junction of the ferrule and joint as well, thus further prolonging the unbendable portions of the rod.

Second—Though little complaint can now be made of the prices asked for good rods, considering the really elegant workmanship displayed and the great difficulty and expense of obtaining fit material—a difficulty and outlay not justly appreciated by the uninitiated—still the purchaser might with propriety wish the benefit of any diminution of cost, which neither impaired the value of the rod nor lessened the already reasonable profit of the maker.

The dowelled ferrule and its mate practically consist of two ferrules, one cap for female ferrule, metal dowel fitted to end of joint, wooden dowel within, and on which the metal dowel is fitted, boring out recess to receive dowel, and lining same with metal.

The simple ferrule and its mate are two pieces of plain tubing, one fitted to enter the other. As the male ferrule in either case may or may not be capped, such cap is not included in the above enumeration.

Therefore it is clear that as far as cheapness of production is concerned, the dowelled ferrule is at a disadvantage.

Third—It will not be questioned that a large majority of breakages take place at the ferrules. Nor will facility of repair be lightly valued by any one, who has once met with this accident when distant from the repairer, and after a considerable journey to his favorite stream.

To repair on the ground, in camp, or at such lodgings as trouting regions usually afford, presents these difficulties, If the break is above the male ferrule, it becomes necessary to shorten the rod by the length of both dowel and ferrule, to say nothing of extracting the broken wood from the metal parts, and the nice fitting required to make even a temporary success of the job. If the ferrule is secured by that abomination, a pin, the difficulty is increased. It must be borne in mind that not only must the wooden spike, upon which the metal dowel is to be placed, be made central and in line with the axis of the rod, but it must fill the metal nearly or quite its whole length and also fit tight therein. Otherwise, in the first case, the rod will not come together so as to be safe against that most disgusting mishap of throwing apart; while in the second case, when the rod is unjointed, the metal dowel will remain behind in its socket.

Again, shortening a favorite rod between the butt and second joints by two inches or more, will so change the action as to make its owner fairly sick at heart.

On the other hand, if the rod breaks below the ferrule, he is even more helpless; for aside from ridding the ferrule and cap from the broken portion, how is the tapered hole to be bored to receive the dowel? Yet unless this is done somehow, the dowel will strike against the end of the joint within the ferrule, and the male ferrule, if it enter at all, will not do so sufficiently to permit the rod to be used.

Again and again have I known the accident to occur, and never knew it to be remedied short of some kind of a shop; while, except in a few rare cases and with common rods of little value, it has been a case of immediate quarantine and subsequent hospital treatment by a professional rod doctor.

But if a rod provided with the simple ferrule is so broken, a few matches softens the cement which retains the ferrule in position, the broken piece is pushed out and the ferrule replaced with the very minimum loss in length, and that by the merest tyro in repairs. And in fifteen or twenty minutes he goes on his way, if not rejoicing, still not a fit candidate for a madhouse. Here surely the advantage is not with the dowelled ferrule.

Fourth—But it strengthens the rod:

A sane man would hardly anchor a 16-foot catboat with a frigate's best bower anchor, though that would undoubtedly strengthen that boat's hold on the bottom. And so, if without the dowel and its complications the requisite strength can be obtained, it would scarcely seem common sense to retain it for that reason alone.

Through ten trips in Maine I have used the plain ferrules. That on the end of the butt-joint is scant two and one-half inches long, and made from metal of the thickness of an ordinarily heavy visiting card, considerably thinner than any other make of ferrule that I have ever noticed on a flyrod. Yet I am unsparing in my demands upon a rod. When the September sun is just about to vanish behind the hills of Western Maine, there comes a time when all that gambling spirit which actuates enterprise in man, takes possession of that angler so fortunate as to be on the ground. He wants no third or fourth prize in the lottery. His casts are for the first, or at least a good second—five pounds, no less, will pass; while if beneath the water there is any sense whatever of the fitness of things, it is the plain duty of an eight or ten pounder to offer.

At such an appointed time, and it is brief at best, minutes are precious, and a two and a half or three pounder—anything which it is humanly possible to derrick with the tackle in use—is reeled in and got rid of without the slightest ceremony, and with the reverse of thanks for his attentions. I have done my share of this with ferrules, as described, and never yet has one bent or given way. It is to be borne in mind that before a tube will bend it must collapse, and if the rod is so put together that the ends of the joints within the metal are close together (say one-eighth to one-sixteenth of an inch, which is quite ample to allow for wear) it is plain that to bend the ferrule will require a power almost equal to the tensile strength of the metal itself, a strain to which, in use, no fly-rod is ever even approximately subject. It would, therefore, appear that in this particular the simple ferrule, properly constructed and applied, is practically quite the equal of its dowelled rival.

Fifth—It strengthens the rod! And this is the only assertion in its favor I have ever been able to elicit.

But is this assertion true?

I believe that it is not only false, but that the direct contrary is the truth. A ferrule may be able to endure any possible strain with impunity, while the rod to which it is applied may be as brittle as a pipe stem. Of course the weakest point in the rod measures the strength of the rod.

This is just the case in point.

A dowelled ferrule in itself is undoubtedly stronger than a simple ferrule, but the rod to which it is applied is weakened thereby, and is not as strong as it would be were a simple ferrule of proper construction substituted in its place. The strain brought on the unyielding metal is localized and concentrated at its extremities. The ferrule and its mate act as one single lever, in which the power is applied at one end, while the fulcrum is at the other. It is elementary and axiomatic that the longer the lever the greater will be its power. If the weight to which the lever transmits its effort (the timber beyond the ferrule), and that effort exceed the strength of the fulcrum, the latter will surely be crushed, *i. e.*; the rod will break at the ferrule.

This simple principle of natural philosophy seems to demonstrate that, other things being equal, the introduction of any ferrule weakens a rod, and that a longer ferrule weakens a rod more than a shorter; since with equal pull at the tip, more strain is concentrated at the end of a long ferrule (or lever) than at the end of a short ferrule (or lever).

It is a corollary to this that in all jointed rods the points where the ferrules terminate are subject to a degree of strain considerably in excess of the proportion due to their location—or in other words, in excess of the strain imposed at the same point under like conditions upon a like single-piece unjointed rod.

Therefore fracture at those points should be more common than at others; and that such is the fact every one knows, one theory tells us such should be the result—our experience shows such *is* the result. Therefore it would seem the theory has stood the regulation verification by experiment, and that it may be safely accepted as sound.

A dowelled ferrule must of necessity be long. A simple ferrule may and should be short. Wherefore it again appears the verdict must be against the dowel. How it first came into use I think I can understand. At the comparitively recent period, when the American rod maker ceased to be a mere imitator of the English, and allowed his individual ingenuity and brains fair play, each maker, of necessity, made his own ferrules, bending the plate metal over a mandrel, and soldering the seam himself. Then placing the tube so formed upon a tapered mandrel and the latter in his lathe, he forced a steel roller against the nascent ferrule while it revolved, and thus rolled it into shape and condensed and stiffened the metal at one operation. To accomplish this result it was requisite the ferrule should adhere to the mandrel and revolve with it. This necessitated the use of a tapered mandrel, so that the ferrule as it stretched and shaped itself under the pressure, should always fit snugly upon and receive its motion from the mandrel. A tapered ferrule was the result, one which, while it fitted its mate at the mouth, was too large within. Something therefore was required to steady the inner end of the inserted joint, and to accomplish this the dowel-pin was employed.

This was all very well in the then state of the art. But why it should still survive, when in any city tubing of any required size can be procured drawn inside and out; and that, if ordered in quantity, cheaper than it can be made by one not in the business, I am at a loss to conceive.

If any one knows of any advantage the dowelled ferrule possesses, I should be pleased to be instructed, for I can imagine none.

In conclusion I would suggest three points to the favorable consideration of those whose ideas and habits are not as yet formed beyond change—all tried in many a contest, and believed to be of value.

Use a handle with a ferrule immediately above it—or, better still, sunk into it—to receive the butt joint, the whole so arranged that while the handle remains still the butt joint can be turned readily so as to present the rings beneath or on top of the rod. One handle will thus do for all single-handed fly-rods, heavy or light. You can cast with the rings underneath or above, while the reel always remains in its normal and only convenient position—that below the hand and under the handle—and you can change from one to the other as your fancy dictates. You can play your fish in the same way, changing the direction of the strain in an instant and a dozen times on the same fish if you wish. Thus in ordering a new rod you will not only save the expense of a new handle and its furniture, but avoid the temptation to use strong language when you find your old reels will not fit. Again, your rod, even if of inferior material, will always remain straight and uniform in action.

Next to discarding the dowel pin, I believe this to be the most valuable improvement which can be applied to the fly-rod as at present made. I am aware this construction is not altogether new; but it is uncommon, while its great merit should make it universal. And even when employed, it is not unfrequently regarded either as a mere ornament or as a device to make possible a cheaper or lighter handle, while its most important function (the ability frequently to reverse the direction in which the strain is brought upon the rod) is altogether ignored. Let any gentleman have one of his rods (especially if it has already taken a set) cut immediately above the handle, and a short, well-fitted, simple ferrule inserted to reunite the divided portions, and then try it for one campaign.

Of course, to bring the rings above, but half a revolution of the butt joint in the handle-ferrule will be required, and the line will then wrap in a long spiral half way round the rod. Now if, in reversing the rings to underneath the rod, the precaution be taken always to reverse the motion as well (so that the line will lead straight to the rings and not wrap all the way around the rod), it—the line—will be found to render equally well in either position of the rings.

And, unless the teachings of ten years' practical experience are delusive, the more particular he who tries it is in regard to his tackle, the more certain he is to adhere to it ever after.

Second—Be liberal in the use of rings. If you seize a piece of wood of uniform strength by the ends and break it, it does not give way where it is grasped, but at some intermediate point. And thus with a fly-rod. By being liberal in the matter of rings you diffuse the strain, so that though its aggregate be great, yet at no place will it reach the breaking point.

Third—Place a ring close to each ferrule and its mate; *i.e.*, so that when the rod is jointed a ring will be both above and below the unyielding metal, for thus, for reasons before stated or implied, you lessen the danger of accident at those points.

I will throw in one more point for good measure and for the benefit of those who don't already know and use it: Always tallow or oil your ferrules and then wipe them as dry as you can before jointing your rod. You will then never be plagued by having the joints stick and refuse to separate. This is of especial importance when the handle hereinbefore recommended is used.

The truth is, Mr. Editor, us anglers have fallen, or are falling, into a rut, and are three-quarters asleep besides. Occasionally some book on our favorite pastime appears, and the fraternity is momentarily galvanized; but a speedy relapse follows. We cannot fairly expect aid from the professional class to wake us up; if for no other reason,, because if they tried it the effort would probably be misunderstood. Nor have they, as a general thing, time for that actual practical experience which teaches the defects of the old and discovers the new. We business and professional men, amateurs, whose only purpose is to share with others the benefit and pleasure we ourselves receive and enjoy, can do this. It is, and must be, a labor of love.

In a moment of impulse, perhaps of folly, I have thrown my feather-weight into the scale. So far the result has not been very encouraging, but hope is not yet quite dead.

Is it possible that the great fraternity of fly-fishermen are dumb, or are they ignorant, or is it because they show at the writing table a degree of indolence and selfishness they would blush to exhibit in the field?

A comparison of the correspondence in your paper in reference to the art and implements of the angler with that in reference to other sports is a standing shame and reproach to every man who handles a rod. Let us hope for a better future. Henry P. Wells.

New York City.

THE CHRONICLE OF THE "COMPLEAT ANGLER."*

THE scholarly fisherman is under many obligations to Mr. Satchell for the complete and beautiful manner in which he has reproduced the Library of Old Fishing Books. The volume before us is a chatty discourse on the many editions of Walton and Colton's famous book, and is evidently prepared by one who loves his task. The book is handsomely printed, bound in half leather, Roxburghe style, and is one that reading anglers will appreciate. In closing, it says: "Fishers have increased and fishing books have multiplied, but where is the fisher blest with such a 'heavenly memory' as our Izaak, and where is the fishing book so rich in honor and renown as his? On royal and noble shelves—the brown overcoat unscorned by the purple and splendor of courtiers and dramatists and poets—there do we find you, O little book 'of eighteen pence price.' Shakespeare looks kindly on you; Bacon eyes you with a kindly smile; Sir Philip Sidney and you are paired, in the pairing of pastorals; Elizabethian wisdom and Elizabethian quaintness and pathos own you for an equal."

*The chronicle of the "Compleat Angler" of Izaak Walton and Charles Colton. Being a Bibliographical Record of its various editions and mutations. By Thomas Westwood. A new edition, with some notes and additions, by Thomas Satchell. London: W. Satchell, 19 Tavistock street, Covent Garden, 1883. (Price, 10s. 6d.)

English Grayling for the St. Lawrence.—Mr. S. Maltby, of Montreal, writes to the *Star*, favoring the introduction of English grayling into the St. Lawrence River. We do not know wherein this fish is superior to the Michigan grayling, it is not as handsome. The letter says: "I attended the late meeting of the Montreal Fish and Game Protection Club, but my time being rather limited I did not have the opportunity of bringing before the meeting the importance of introducing the English grayling into our noble St. Lawrence. If this were done, it would be a great boon to thousands of our fishermen who have not the opportunity of spending a season in the Lower Provinces. The Old Country grayling is not to be equaled for pluck; it will rise at the fly after being pricked with the hook, not once but several times. In fact it may be considered a perfect bulldog, as it will hang on to the last, until it eventually succumbs to the net. The St. Lawrence is about the same temperature as the River Trent in England, with the exception that it is considerably colder in winter, but this would be no disadvantage, as the grayling generally selects the coldest streams and thrives better in them. Once introduced into the St. Lawrence, no fish would equal it as a delicacy of the table, unless we except salmon. Trout in the Old Country bring twenty-five cents per pound, the grayling thirty cents. The grayling season commences at the close of the season for trout, and we have in Canada three months of beautiful fall, and in the winter season even the grayling comes in within a few yards of the shore, thus affording the angler or fly-fisher a delight seldom excelled. The fish will rise at the fly when the ice is coming down the river. The grayling

is out of season in the latter part of April, when the noble bass comes in for its share of glory. Pressure of business prevents our fly-fishers from following up this sport except on Saturdays, when most of our business houses close at one o'clock, and I can say with certainty that the half holiday would be taken advantage of by hundreds of our young aspirants in fly-fishing. I hope the society will take note of this and endeavor to introduce the grayling into the St. Lawrence."

Fisheulture.

THE MENHADEN QUESTION.

Editor Forest and Stream:

Your correspondent "W. M. H." takes exceptions to my statements as published in your issue of Jan. 24, and refers me to the hook and line fishermen between Cape Cod and Sandy Hook, and also to some of the fresh fish dealers of Fulton Fish Market, New York City. In my opinion three-quarters of the hook and line fishermen on the coast he names would subscribe under oath to an opinion exactly opposite to his, and as to the Fulton Market fish dealers I should not want any better evidence than their books afford, that there is no scarcity of fish on our coast and never has been. He says he has been bass fishing for seventeen years, if so where has he fished, up the river among schools of menhaden or off the rocks in the surf of the open sea? If it was, as he and others state, that bass depended on menhaden for their daily food, they would be found in their company, but we know to the contrary, and have men with over forty years experience to prove it. I have yet to learn that a striped bass was ever caught in the Narragansett Bay in a purse seine, and as he does not seem to be posted as to their manner of working, I will state for his benefit that river purse seines are seventy-five feet deep, nine hundred feet long, and are as effective to take fish in six feet of water as in six fathoms. As to the parts of nine full grown menhaden he found in one bass, it only proves that they were thrown into the water as bait, for bass never masticate their food. Our menhaden boats always have the best of lookouts aloft, and it comes within their observation to know what feeds on menhaden, and they report that no fish known to our markets are ever seen feeding on them except bluefish and bonitas, and they not often, but sharks and whales and fish of like species are constantly preying upon them by wholesale, and it often happens that we can't save menhaden after we catch them, for the reason that sharks tear the seines and let them out, and if we inclose whales, which we occasionally do, a seine is no obstruction when they conclude to swim away. We estimated that our boats landed in one day during the season of 1883, over one hundred tons of sharks at our Rhode Island factory, and their average size was larger than a kerosene barrel, and there were over two hundred menhaden in the stomach of each shark.

His statement that no menhaden could be procured in this vicinity for love or money during 1883 fresh enough for bait, is not borne out by the facts, for there were plenty of menhaden in Narragansett Bay during the whole season. Capt. Charles Winslow, with a sail gear, took over 10,000 barrels, and John Brownell with a steamer took over 23,000 barrels, and it has been reported to me, although I know nothing of the truth of the report, that excellent bass fishing has prevailed at West Island during the season of 1883. It is my opinion, after twenty years or more experience as a hook and line, trap, pound and purse seine fisherman, and from what I have learned of others and read, that there are periods of flood and drought constantly occurring with salt-water fish, and man is no more responsible for the droughts than he is for the floods, and as an argument to prove my opinion I submit the following:

First—During the winter of 1856 and 1857 most of the tautog between Barnegat, N. J., and Plymouth, Mass., were destroyed by frost, and on that account that fishery was abandoned during the fishing season of 1857; but in four years they were as plenty as ever. The same disaster happened to the same fish during the winter of 1874 and 1875, and the fishery amounted to almost nothing during season of 1875, but during season of 1878 they were as plenty as ever before known.

Second—Squeteague were plentiful in the waters of Narragansett Bay fifty years or more ago, but they left before the days of traps, pounds, or purse seines, and were gone for many years. During 1870 a flood of that fish prevailed, and before 1878 we had a drought, and since the last date mentioned another flood has prevailed.

Third—Porgies, or scup, were unknown to our waters before the year 1800, and were called at first Jefferson fish, for the reason they made their appearance the year he was elected President of the United States. They remained in our waters until 1867. From this time to 1870 there was a drought, but during the last mentioned year there came on a flood, and while it prevailed there were days together that the traps were not lifted, although they were overflowing with fish. The reason of their not being lifted was, no market for the fish. I don't know as Mr. Rogers could have bought sixteen hundred barrels for sixteen cents per barrel, but I had ten times that amount offered me at twenty cents per barrel and did not buy them. The same state of things existed during the spring of 1882, although the heavy fishing was brought to a sudden close, for a heavy storm with a high sea tore up the traps and pounds, and stopped all fishing for several days. After it was over, it was found the scup had left the coast.

Fourth—Sheepshead used to be plenty in this vicinity many years ago, but left and have never come back, and in my experience I have never seen one east of Sandy Hook.

Fifth—There used to be on the coast of New England an abundance of Spanish mackerel, a different fish from our present Spanish mackerel, but not one of that species of fish has been seen in our waters for the last thirty years.

Sixth—During the mackerel flood of 1831, 335,559 barrels of mackerel were inspected in Massachusetts. During the drought of 1841 only 50,992 barrels were inspected in the same State. During the mackerel drought of 1877 about 100,000 barrels of mackerel were inspected in Massachusetts, and the cry went up that mackerel were gone forever, and a stringent law was called for to prevent their being taken with purse seines, for their scarcity was charged to them; but the mackerel flood of 1882 wiped out that delusion, for there were during that year 260,000 barrels inspected in Massachusetts, and the sum total for the three States of Massachusetts, New Hampshire and Maine was 378,592 barrels.

Seventh—During the year 1840 a flood of shad made their appearance on the coast of Cape Cod, extending west to Narragansett Bay. They disappeared during the fishing season of 1842, and have never been back.

Eighth—Zacheus Macy in his history says: Bluefish left the coast of New England during the year 1765, and we have no record of one being seen for seventy years. They made their appearance again during the year 1832.

Ninth—A flood of codfish prevailed between 1875 and 1878, and the wholesale price ruled as low as one cent per pound delivered in New York, Boston and Philadelphia. Since then there has been a drought, but at present there is another flood and the wholesale price in Boston is 1¼ cents per pound.

Tenth—Twenty-four years ago there was a flood of sea bass, and they were caught in such abundance that they could not be sold in market for enough to pay the expense of handling and transportation, and as a result thousands of barrels were sold for manure. This flood lasted for several years, and then a drought came on which lasted until two years ago, when all at once a flood of this fish made its appearance from Cape Malabar to Virginia. Said flood is now in existence, and from appearances there will be a surplus of sea bass for several years to come.

Eleventh—About forty years ago there was a drought of menhaden which we know extended from Sandy Hook to Cape Cod, and the fishery was abandoned by a large number of the fishermen, and it was almost the unanimous verdict that overfishing was the cause of the trouble, as a few sail gangs had been added to the menhaden fleet the year before. The old croakers figured up the millions of fish that had been destroyed, and their conclusion was that no fish could stand such wholesale destruction. Afterward they made their appearance, and the fishery has been prosecuted with varying success ever since. The most noticeable drought ever experienced has prevailed since 1878 on the best menhaden grounds ever known, situated between Cape Cod and Eastport, Me.

During 1882 there was a dearth of menhaden from Cape Cod to Sandy Hook, and it was the current opinion of those that believe that man is responsible for the absence of fish that overfishing had caused them to disappear north of Cape Cod, and that the same influence had driven them from the waters between Cape Cod and Sandy Hook, and if the depletion went on menhaden would disappear from our coast. The catch fell off nearly one-half, and fourteen steamers and seventy-six sail gangs were withdrawn from the business. But the results of the menhaden fishery for 1883 have confounded all the croakers, for it is a conceded fact that more menhaden were present on our coast during 1883 than were ever before observed, the catch, notwithstanding the large reduction in the menhaden fleet, being over 850,000 barrels larger than in 1882.

In conclusion, we will say that we have the most skillful fishermen, and, as it was proved at the London Fishery Exhibition last year, the most perfect fishing apparatus on earth, which bespeaks their pluck, energy and ability. They furnish to our farmers guano at a low price, equal in value to Peruvian; they are educating and disciplining young men to the knowledge and hardships of practical seamanship, who can, if necessity calls, fight on the ocean the battles of their country, or compete, when a chance is given them, for our part of the carrying trade of the world. Their calling at best, through the uncertainties of fish, dangers of storms, and perils of navigation, is hazardous and uncertain, and should be encouraged and fostered. Most every other business in the country is protected, but the Government of the United States affords none to its fisheries, but allows the importation of oils and fish duty free to our markets. DANIEL T. CHURCH.

TIVERTON, R. I.

CARP IN SOUTH CAROLINA.—The following note on making fish ponds in rice fields would suggest that the fish are more profitable than rice: "Columbia, Jan. 18.—The State Fish Commissioner expects to establish, about Feb. 1, a carp hatchery at Donaldson's plantation, on Winyah Bay, opposite Georgetown, the place recently so favorably reported on by Superintendent Huske. Twelve and a half acres of rice field will be flooded and converted into fish ponds, and it is expected that the ponds so formed will be admirably adapted to the breeding of carp. The ponds will be stocked with 150 four-year old and 400 two-year-old carp. The Commissioner expects to supply the young carp for the next season's distribution from these ponds. After the first year of carp culture in this State the number of fish distributed yearly has doubled annually until this year, when 18,000 carp were sent out, making a distribution four times as great as last year. It is expected that these Georgetown ponds will yield, at the lowest estimate, 10,000 young carp annually per acre, and if the anticipations of the Commissioner are fulfilled there will be 125,000 young carp ready for distribution next winter. When it is considered that a thousand ponds in the State were this winter stocked with carp, it will be seen that the raising of this fish must become a large industry in South Carolina."

AMERICAN FISHCULTURAL ASSOCIATION.—The date of the next annual meeting has been fixed for May 13, 14 and 15, in Washington. It is expected that there will be a good attendance and many valuable papers.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **869.** Volume I., bound in cloth, sent postpaid, $1.50.

ALMOST A DOUBLE.

Editor Forest and Stream:

A sentence in the letter of your West Virginia correspondent, in Jan. 17 issue, recalls a little incident in my own experience that, if not unusual, at least serves to point a moral.

"I don't like to hear a sportsman say that he shot a quail and partridge at one rise," and yet I came very near accomplishing that feat some years ago, and only failed through a severe attack of the quail "ague."

My old slow setter and I (he is mentioned first because he had more hunting sense than I shall ever be able to acquire) had been hunting for an hour or two in the afternoon, anxiously looking for quail and partridge, with fairly good success on his part, and the usual indifferent results on mine, when we came upon a small clump of trees and undergrowth, in the middle of a large salt meadow, which we had never explored, and as a forlorn hope I whistled to "old high head" and waved him toward it. Hardly had we stepped inside the fringe of shrubbery surrounding it, when the old dog "froze" with his head well twisted to the right, but as I neared him, his tail trembled a little and he very cautiously turned his head equally as far around to the left, and solidified again, remaining so for perhaps a quarter of a minute, he as carefully returned his head to its first position, and remained steadfast, true to his first love.

As no amount of coaxing or force could ever make the staunch old fellow go on, I stepped a few yards ahead of his nose, and up boomed an old cock partridge, which I surprised myself and the dog by stopping with the first barrel, and at the first boom of his wings away went a big bevy of quail at my left, startling me so that I shot the remaining barrel at the bunch and killed —— the usual number.

Perhaps many sportsmen can recall just such instances, but I pen this simply to call attention to what my old (dog) friend said to me at that time as plain as dog could speak: "I was broken on partridge and learned to love them when I was a little fellow, and although a big bunch of quail smell very nice to me I still like my oldest friends the best."

We afterward worked the place thoroughly, and got ten or eleven of the quails, so the bunch in the meadow proved quite a corral.

Moral: First, stick fast to your old friends; second, always break your dog on the game you most desire to hunt, as "Old Tom Buckley," once a noted duck and woodcock shooter of this city, used to say: "You git de woodcock snuff in his nose de fust bird he smells, and he'll neber forgit it if he lives a hundred years." SLOW DOG.

NEW HAVEN, CONN.

THE DOG TAX AND THE GAME LAWS.

Editor Forest and Stream:

I have long observed that while thousands of sportsmen are calling aloud for efficient game laws, and equitable dog laws, none seem to advance any practical plan for their execution were they enacted. Even the laws we have would do pretty well if enforced. I beg leave to submit a plan for the enforcement of such laws in the hope that a discussion may be aroused and the sportsmen led to fix on some one good plan and work together to carry it out.

The only way to get laws enforced is to pay somebody for doing it. Now, where is the money to come from? I say from ourselves mainly. Let the taxation of sportsmen pay for their protection. Let all money obtained from the taxation of dogs be devoted to the execution of dog and game laws. Dog laws should provide for the taxation of all dogs over six months old, at a given sum per head. It is improper to tax the bitches at a higher rate, because it is not right to legislate against dog breeding. Counties should be divided into districts of convenient, size and in each district a dog constable appointed who should also be game and fish warden. This constable should assess and collect the dog tax, and destroy all dogs for which no tax is paid, or in case such dogs are valuable, he might be permitted to sell them, in a manner to be prescribed by law, and turn in the proceeds to the dog tax fund. In case persons harbor dogs of which they deny the ownership, the constable should be required to procure from the justice of the peace or other judicial authority, a warrant empowering him to enter the premises of such person for the purpose of securing any untaxed dogs. The constable would, in the execution of the dog law, be enabled to have an eye on all persons who would be probable violators of the game law and thus be all the more efficient as a game warden.

The money arising from the rigid collection of the dog tax would be ample for the purpose in view. At present I do not believe that one-fifth of the possible yield of the dog tax is collected. I am aware that the claim of sheep-owners to payment from this fund for sheep destroyed by dogs is a difficulty to be overcome. But, in my opinion, the sportsmen will do best to admit that claim as the first to be paid from the fund, and avoid arousing opposition in that quarter. In the practical working of my plan it would be found that the horde of ill-bred curs owned by irresponsible parties, and who do more than nine-tenths of the sheep killing, would be exterminated, and dog owners paying taxes would be more careful to look after them. Again, the constable, in the course of his duties, would come to know which dogs were addicted to sheep killing, and would generally be able to fix the damages on their owners.

On the whole, we may conclude that the sheep damages would make but a slight inroad on the fund. I believe such a law could be passed in any State if sportsmen were to press it earnestly, and if passed it would put a different complexion on their interests. I hope my scheme will be carefully considered and amended in every desirable way. That my fundamental idea is the right one I do not believe can be denied.

In urging the passage of such laws we always meet the objection of the uninterested. "Why," say they, "should the class of sportsmen be allowed to burden us with laws for their benefit." Never have I seen or heard a satisfactory answer to this question, but I shall endeavor to give one. "Without game there would be no sportsmen, and sportsmen are absolutely necessary to the national defense. The introduction of breechloading and repeating long-range rifles has changed the art of war. The lines of battle and the massive columns, and the field artillery of a few years ago are no longer to be used. The rapid fire and long range of the rifle forbids it. Dynamite torpedoes with electric batteries are coming in to augment the difficulty of maneuvering soldiers in any sort of approach to a close formation when in the vicinity of the enemy. It will become well nigh impossible to maneuver a large force at all. As Skobeleff said: "Batteries must now be fought by skirmish lines, and the reserves must be a tremendous distance to the rear to avoid destruction, by reason of the target they present." Now the skirmish line is nearly impossible to control, as the men are so far apart; therefore, men of intelligence, nerve and skill enough to act a good deal for themselves are necessary for this work.

What is the difference in efficiency between a thoroughly skillful and courageous man, and an average man, both armed with repeating rifles? The history of the James boys, "Wild Bill," "Billy the Kid," Rande, and a good many similar characters, is most instructive on this point, as also the various recent Indian wars. It appears that a man who is a crack shot and is versed in field craft, *i. e.*, can find his way anywhere, and take advantage of the nature of the ground he is passing over, if courageous and well supplied with ammunition, can defy almost any number of ordinary men similarly armed. It is not for nothing that the hardy people of our frontier towns often submit to the rule of a mere handful of desperadoes. The power of a Slade or "Billy the Kid," or other such worthy is as real as any that ever was, and people submit because they must. The disparity between the power of the desperado to kill and that of the citizen, is as great as was that between the mail-clad knight of the Middle Ages and the burghers he was wont to plunder. We have got back to something very like the conditions that existed in the days of Hector and Achilles. Battles will be decided by the skill and courage of individual soldiers. We shall see armies of ten to thirty thousand men instead of hundreds of thousands.

A small army of intelligent, highly skilled men, to whom handsome salaries will be paid, and whose social position will be so good as to make the service an object of ambition, such is what we will see in the future.

To-day, by reason of the prevalent interests in field sports, the United States could raise such an army more easily than any other nation.

But twenty years hence, when the game shall have been exterminated, we shall be at the mercy of any nation wise enough to preserve its game and encourage field sports. Our isolated position will not save us, for with the small armies required and steam navigation the transportation of troops will be a bagatelle. Let nobody imagine that military drill of any kind can educate men to the proper degree. Shooting quail and woodcock, still-hunting deer, etc., give one an alertness, the power to take advantage of the unexpected, and the great art of finding one's way and a close habit of observation, all of which are to the full as necessary as marksmanship for the soldier of the future, and these can only be obtained by field sports. Again, were it even possible for this to

be effected by military drill, is it not better to get it done without cost to government?

I hope none of the readers of FOREST AND STREAM are so foolish as to think war is soon to be abolished, or that the habit of nations conquering others whenever they are able has fallen into the least disuse. We have but to look at the changes in the map of the world wrought within the last twenty years to show us that the only way to get or keep liberty is by force of arms.

Oh! But some one will say, "This is only an artist, a dreamer." True enough, but the artist has heard the whistle and felt the sting of bullets, and the vision is inspired by the haunting memory of battlefields where, with his own eyes, he has seen the breechloader do its awful work.

J. M. TRACY.

FOX HUNTING ON CAPE COD IN 1884.

Editor Forest and Stream:

I take the liberty of sending to you herewith an account of a fox hunt which took place at the close of last month within the limits of the old Bay State.

Of course I would not compare our sport here with the more delightful method of enjoying this pastime in "merrie" England. I am too familiar with the music of the Warwickshire and North Warwickshire hounds, and with the top and width respectively, of the hedges and ditches which skirt the hunting grounds about Leamington to draw the comparison, albeit ten years have passed since I joined with the members of the hunt there in the run 'cross country.

Now the scene is changed, and the beautiful pasture lands of Warwick give place to the sandy pine-growing hills of Cape Cod, with acres of scrub oak, dotted with ponds and intersected by little streams. Here a sportsman could not follow on horseback, and we who love to hear our foxhounds "sing the news" must enjoy the sport on foot.

It happened that on a day peculiarly adapted to fox hunting a party consisting of Mr. C. H. Nye, the agreeable superintendent of the Cape Cod divison of the Old Colony Railroad, Mr. James Taylor, an old fox hunter of West Barnstable, Mr. G. L. Bassett, of Hyannis, and others, together with Mr. Wm. D. King, of Newport, R. I. (who took with him to the cape Mr. George A. Strange, of Berkley, Mass.) assembled for a New England fox hunt. So motionless was every tree and shrub, that but for the hunt, nothing would have broken the stillnes of nature, save the shrill whistle of the passing locomotive, the noise of the wood-carts, the song of the woodman or the sound of his laboring axe. A thin sheet of snow which covered the ground made the scent of the fox most favorable for the sagacious dogs.

After driving two miles to the scene of our sport, we hastily tied our horses in woody lanes, and took our stands at points properly distant from one another, leaving our dogs to do their work. Nor did they betray this trust. In a few moments we heard them, and their first occasional notes were very soon followed by that thrilling burst, which always greets our ears when reynard is up and away. Probably each one of the party, when, in the early morning hour, he heard the dogs give out their measured and unbroken tongue, mentally ejaculated, "that is a start," for so it proved. In the language of our fox hunters, reynard "played well," and we listened for two hours to the entrancing sounds which came from the lips of each of our "favorites." happy when they were far away, carrying the responsibility of the shot elsewhere, still and almost breathless when they were near, lest a chance movement of ours should turn the quarry, and forfeit the brush. At about half past 9 o'clock the fox crossed within thirty yards of Mr. King's view, when a shot from his Parker gun ended the run, and for a short time silenced the music in the air.

It was the work of but a few moments to place fox No. 1 in a wagon, divide into two parties within good hearing distance of one another, and attempt another "start." Mr. Bassett soon discovered the track of an old "settler," and at once placed his splendid animal Alto upon the trail. In a few moments she drove the veteran upon his feet, and away she went alone and unattended to wait upon this fox which had so long baffled the hunters of the locality. One of the party now sought the railroad near by, having learned that it was the custom of this particular fox to go and run the rail, thus throwing the dogs off the scent. Though he failed to place himself in a position to get a shot, Mr. Bumpus, however, saw the fox come upon the track, witnessed the running of the iron for some distance, and watched the animal as he slipped off the rail and hopped up the hill, pausing there for a moment to look behind. Soon along came Alto, in full cry until she reached the iron rail, there all scent was lost, of course, and so running over, and back and forth, the intelligent beast, unable to rectify the fault, submitted to the call of Mr. Bumpus, who placed her where the fox had left the iron, when away she flew carrying her beautiful head well in the air and uttering the language, "this time you are mine," clothed with all the melody of a fox hound's tongue. At noonday Mr. Strange succeeded in crippling, at long range, the sly old fox, which Alto finally brought to bay, and then it was that a charge from Mr. Taylor's 10-bore relieved the dog of any further duty in that direction, and stretched a handsome twelve-pound fox at his feet.

About the time that Alto had started the second fox, and but a short distance away, Mr. Nye's beautiful spotted dog aroused another from his morning nap, and began a run which lasted nearly the remainder of the day, through a partially burned district, the scene of our hunt. She was at once joined by Mr. Taylor's pet (the hero of many a day's sport) and by Mr. King's white dog Dick (celebrated in Sullivan county, N. H., especially in the vicinity of Newport, and who to-day was hunting away from his native hills for the first time). The second fox having been dispatched, Alto entered with the others upon the race for the third, and now came the grandest chorus of the day.

Brother fox hunters, old and young, who love the woodlands and the cry of hounds, listen, with your ears of memory and experience, to the music of those hours which were passing, alas all too quickly, by.

Until late in the afternoon the dulcet tones of Alto, mingling in glorious harmony with the clarion voice of Dick (ever in the van of the chase), were echoed back by the combined melody of the slower but none the less true four-footed followers belonging to Mr. Nye and Mr. Taylor. Once I caught a glimpse of them, and again I saw them as they crossed the lane in the distance; first the flash of yellow fur, then, with superb dash and ringing chorus, Alto with the white dog, followed by the rest, and all pointing to the fleeing fox with the accuracy of the needle to the pole.

This was rapture itself, and could the English bard have been in the midst of us perhaps he might have qualified his verse:

> "In thee alone, fair land of liberty,
> Is bred the perfect hound, in scent and speed
> As yet unrivalled; while in other climes
> Their virtues fail a weak degenerate race."

With the declining day, the crack of Mr. King's breechloader secured to him a second brush, and ended the song notes which had so long marked the devious path over which the fox had been leading. The fatal shots alone had interrupted the incessant cry of the hounds from morning until nightfall.

On our way to the wagons the indefatigable Alto, familiar as she was with every part of the hunting ground, stole away from us and started another fox, which we were reluctantly obliged to leave. Thus we had secured three foxes, in runs occupying nearly the entire day, and had started a fourth fox, and these were full grown foxes and not early cubs.

By the participants in this fox hunt the 30th of January, 1884, will be counted as a red-letter day in the annals of their fox hunting, and such, I think, it will be considered by your readers, who may be interested in this kind of sport. K.

BERKLEY, Mass., Feb. 11, 1884.

CINCINNATI BENCH SHOW.

Editor Forest and Stream:

Numerous have been the inquiries as to whether the flood here would stop the holding of the bench show. I am glad to be able to state that the river is receding fast, so that by next week the railroads will be all right and the show will be given as advertised, 4th, 5th, 6th and 7th of March. The entries close Feb. 25. CHAS. LINCOLN, Supt.

CINCINNATI, Feb. 16.

BEAGLES FOR FOX HUNTING.

Editor Forest and Stream:

I am a New England man, and fond of fox hunting. To me it seems that the foxhound of to-day is a degenerated dog. Am I right, or is it only that I am growing old, and the notes of the old-time dogs came to me more mellow and musical in memory than they really were? Whatever be the true cause of my discontent, one thing is certain, I am looking about for a successor worthy of the hound I knew when a couple of decades younger than I am now.

Your columns have recently had much about the beagle. Is he the coming dog? And how would the beagle do for fox hunting? Is he too slow? Will some of your readers who are conversant with the qualities of the beagle give, through your columns, their views on the points referred to? BUGLE.

VERMONT.

THE BEAGLE CLUB.

PRESS of business has prevented me from expressing sooner my thanks for the honors conferred upon me and the confidence shown in me, by members of this club, to most of whom I am a stranger. I shall faithfully serve the club and its interests, and do all in my power to make it a successful and strong organization.

The present condition of our club is flattering indeed, and beyond our most sanguine expectations. Its membership is growing from day to day, and I hope, at no distant day, to be enabled to report a membership of five hundred, as you, dear editor, think we ought to have.

Let me once more call upon all, not only breeders and owners of beagles, but all those who take an interest in the beautiful and useful little hounds, to enroll themselves with us, in this, our mutual cause, and send in their name at an early date. A. C. KRUEGER, Sec'y and Treas.

WRIGHTSVILLE, Pa.

THE POINTING INSTINCT.

Editor Forest and Stream:

I am the possessor of a dachshund puppy now some four months old, the mother of which was imported last summer from the celebrated kennel of the Duke of Saxe-Coburg, in Germany, said to be the finest strain of black and tan dachshunde in that country, she giving birth soon after her arrival here to four puppies, all of which, except one, have since died. I am told in olden times they were used for birds as well as rabbits, badgers, foxes, etc. The mother this last fall came across a bevy of quail and stood them as staunch as any old setter or pointer. Is it in the blood or an exception? My dog is a perfect beauty and house pet, and quick as lightning and very intelligent. YORICK.

[It is not uncommon for individuals of many of the different breeds of sporting dogs to imitate the point of the setter and pointer. We have shot a ruffed grouse over a foxhound, who pointed it as staunchly as a setter. We have also seen a half-bred rough-haired terrier frequently point sparrows in the street, remaining perfectly rigid until the bird flew.]

THE CLUMBER SPANIEL.

[*Concluded from page 34.*]

THE Earl of Arundel, at Wardour Castle, has or had some ten years ago a nice strain of the breed; but those I have seen have been rather on the small side, and resembled very much in appearance Prince Albert's strain. I have seen several of them at work, and nothing certainly could be better; and although the Clumber spaniel should be large and heavy, I think, if this strain is purely bred, which there is no reason whatever to doubt, though, as I have stated before, of a different character to the Duke of Newcastle's, his lordship's keeper, Adams, who took great pains in breeding them, erred on the right side, as far as a sporting spaniel is concerned, in encouraging the stamp of dog which I have seen there and at Mr. Bevan's, at Weston Grove, Southampton, who was particularly partial to them; and he is no mean judge of what is required in the field, whether it be setter, spaniel, or retriever.

The Earl Spencer has long cultivated the genuine breed of Clumber spaniels at Apethorpe, Northamptonshire; and so thorough a sportsman is likely to have the best, though I have never had the pleasure of seeing his kennel. Mr. Foljambe's breed was long held in high and just repute, but whether it is still kept up I do not know; his blood is justly prized in most of the best Clumber kennels of the day.

"Stonehenge" says the Clumber is invariably long, low, and heavy; but I have, I believe, shown that this is not so, and that a slight divergence from this rule in the Prince Consort's and Lord Arundel's breed seems to point very strongly to the theory which I have propounded that there may have been an original breed of Clumbers in this country before that imported by the Duke of Newcastle from France. The weight of the Clumber varies, but he averages about 40 lbs. or 45 lbs., though many dogs will weigh from 60 lbs. to 68 lbs. I think the prize dog, Duke, which I sold to Mr. Sam Lang, of Baldwin street, Bristol, for fifty guineas, was over 56 lbs.; he was a fine dog, and had beautiful feather, coat, and color, but he was too short in the back, and carried his stern high, two very bad faults in a Clumber, and when I took him to Mr. Holford's kennel and compared him with his team these faults were very manifest. The Clumber spaniel must be white and lemon; for many years the judges wavered about orange markings, which are decidedly wrong, and the less color about him the better. He should have great bone and very short legs, and they should be straight; he should be well feathered, and his coat should be perfectly straight and silky in texture, and it can hardly be too thick. The eyes should not be large, and should be deeply set in the head, and in mature dogs the haw is often shown as in the bloodhound; a cherry-colored nose is, in my opinion, fatal to any chance of being considered of pure blood. The ears should not be lobe-shaped or long, and they should have little fringe to them and lie close to the head. The loin should not be arched, but the back must be straight; above all the stern must be set and carried low when in work, though he generally carries it gaily when he is not, and should not be docked too short, and be well covered with hair, having a good flag. Jock, the dog whose dimensions were given in "Dogs of the British Islands," and which were taken by myself, was perhaps the best Clumber spaniel ever seen, and he was considered so by Garland, who sent him to Birmingham Show in my name as an experiment. I told him he would be beaten by Duke, who was then in my possession; and so he was, though Duke was not to be mentioned in the same twelvemonth with Jock.

The worst fault a Clumber can have is to give tongue, and no one who values his kennel would keep one who did. There are very few really good Clumbers now being exhibited, and the champion, Looby, is, in my opinion, not worthy of his position; he is too leggy, his eye is wrong, and he has not a Clumber head. The dog Bruce, which is the dog given to illustrate the breed in "Dogs of the British Islands," was not a Clumber spaniel; he was admittedly cross-bred; he was a very fine dog, and had, perhaps, the best feather ever seen.

I measured it on his forelegs at over eight inches, but his head was far too long and pointed, his forelegs very crooked, his color too deep, and his eye large and full. How so astute a judge as Stonehenge could have selected him to illustrate such an important work, I am at a loss to conceive; he was, moreover, pig-mouthed; that is to say, his under jaw was very short, and receded from the upper. Bruce was largely bred from at the time, and, in my opinion, did more harm to the breed of Clumber spaniels than any other dog I have ever known.

As I have before said, the Clumber spaniel is an aristocratic dog, and requires to be treated as such; he is a difficult dog to rear to begin with; but, when once reared, he is very hardy, and will stand a good deal of work, and when once broken is a very valuable dog; but, although he is hardy, and will last for many years, I do not think he is the dog to stand the general wear and tear we require of a spaniel. He is not fit for every kind of covert; and when you have to work all day in a rough, wild country, thinly stocked with game, the Clumber spaniel is not the dog; the kind of ground he should be worked over is that where game is tolerably plentiful, and not too rough, and he should be always worked in a team. Take, for example, hedgerow shooting where you expect to meet with a few brace of pheasants, a hare or two, and plenty of rabbits. He is decidedly not cut out for that kind of thing. He is too big for the rough woodcock shooting in the large, straggling coverts of Wales and Devon. He is not at home there, as a more active and quicker working dog is required. In a recent book on the dog I was rather amused in the article on this dog by its being laid down that a team of Clumbers should consist of nine. I do not know what magic there is in this number, or why it should be neither more nor less. At all events, a couple of Clumbers is of very little use for ordinary shooting. They are too heavy, and cannot force themselves into places where a smaller and more active dog can, though they are by no means deficient in pluck, as I have seen a team of Clumbers come out after working a thick piece of gorse with their eyes all torn and their ears covered with blood. Nobody ever thinks of shooting to spaniels of any kind in covert now where game is heavily preserved, as the pheasants and hares are all reserved for a grand day or two near Christmas; but I prefer a team of good, well-broken Clumbers, and a brush through the coverts half a dozen times in the season for sport before all the battues in the world. I know well that this is impossible where a large head of game is to be kept up; I only say what I like best; but it is only in outside coverts or where game is not very thick that the Clumber is made use of. In commenting on the Islington dog show of 1862, the writer of the article called "The Omnibus" in the new *Sporting Magazine* of that date says: "The eyes and general style of Earl Spencer's Clumbers place them quite beyond Mr. Holford's, and in both classes Western Birt bowed to Althorp." Just before this he says: "The sweet dish heads of the Irish setters attracted many a visitor." Now, with all due deference to such an authority, if in nothing else, this was a point in which Mr. Holford's dogs were certainly a long way superior to Lord Spencer's. I remember examining all the dogs thoroughly, and have no hesitation in declaring the award a mistake. Mr. Holford's dogs had the correct eye, whereas those of Lord Spencer's were too full. Mr. A. W. Langdale, who has bred and shown many Clumber spaniels, thinks the weight of dogs should be from 60lbs. to 70lbs. I cannot help thinking this latter weight excessive, and do not recollect seeing more than one or two dogs of the latter weight, though I have not known many over 60lbs. Mrs. Smale's dog Wynn, of Lyonsdown, New Barnet, weighs 60lbs. or over. I have not seen him, but Leatherhead spoke highly of him when he won first over John o' Gaunt, Tower and other good ones at Alexandra Palace last year. Mr. Langdale's bitch Libnah, weighed 50lbs. I never remember seeing this bitch, but she must have been a large one. I never saw a Clumber bitch who reached that weight; they are generally much lighter than the dogs.

The champion Psycho, belonging to Mr. Charles Frucn, is a very good stamp of Clumber, but much too dark in color, and I should not care to breed from him.

Mr. Homes's John o' Gaunt is a good dog, showing many good points of the Clumber in perfection; but unfortunately his pedigree is unknown. Notwithstanding this I should not fear to breed from him, as I feel convinced that he is a really well bred one.

Mr. Herbert Moser's Bachelor is a fine dog, but bad in his hind quarters. His young dog Baronet I liked much, and I think must have grown into a fine dog when he finished. The same gentleman's bitches, Lance and Loll, have been frequent winners at most of the leading shows. I have not had an opportunity of attending any show for over a year, but I believe there are several good candidates for fame.

The breed of Clumbers is still kept at Clumber Park, where they have some remarkably good bitches; and the kennel would have been much strengthened and improved last season if they had succeeded in breeding from them, but unfortunately they, strange to say, all failed to produce whelps. I do not know what dog was used, but I should say most decidedly that the fault was on the side of the sire.

The Earl of Cawdor has a strong kennel of Clumbers, and shoots a great deal to them. He has a good deal of Mr. Foljamb's and Sir Vincent Corbett's blood in the kennel. His bitches perhaps are rather lighter in the head than is exactly in accordance with the accepted form of the Clumber, but are a rare working sort, with capital coats and good legs and feet. I do not think they are ever exhibited. His lordship's keeper told me that, contrary to what is usually the case, he finds no difficulty in rearing the puppies, rarely losing one from distemper. The Clumber when once reared is not at all a delicate dog, and will last and keep fresh for many years. This is perhaps to be accounted for by the slowness of his pace. This spaniel does not show to full advantage when tied up on the show bench, and they should always be shown as a team, which is certainly an attractive sight at a show to sportsmen, and the dogs having more room and liberty show themselves off to the best advantage. The well-known spaniel breeder, Mr. P. Bullock, exhibited a very good Clumber, Nabob, for many years. He was by Foljambe's Beau, and was own brother to his Duke by Bang, out of Lord Foley's Fan. I think this dog must have been a bad stock-getter, as I have no recollection of seeing any of his progeny, though he was at the stud for years.

Lord Foley was at one time celebrated for his kennel of Clumbers, and his blood was much sought; but I am not aware whether the kennel is still kept up or not. Clumbers always have and always will command a good price, as they are comparatively scarce, and likely to remain so.

I came across, the other day, an original engraving from the picture of the Duke of Newcastle and his spaniels, which I have before referred to. A part of this picture appeared in an engraving in the old *Sporting Magazine* many years ago, but this contained the keeper and the spaniels only. This original engraving represents the Duke of Newcastle and a friend returning from shooting, both on horseback; and Mansell, the keeper is examining a woodcock, several others with pheasants and other game are lying about, and three spaniels are surrounding him. If this is a correct representation of the duke's spaniels, I think we have improved them; the character of the head is slightly different, being short, but not so square as the modern dictum requires; they do not appear to be so large as the modern dog, in fact I should say they are about 35 to 40-pound dogs; they are not quite so low on the

eg, or so long in the body, and, although their coats are flat, there is more curl in the feather, particularly on the stern, than is now approved of. The dogs altogether resemble very much the breeds I have referred to as belonging to Prince Albert, the Earl of Arundel and Mr. Bevan; but they look like workmen all over.

One great characteristic of the Clumber spaniel when pure is his fondness for the scent of feather in preference to fur; in fact, he seems to despise the latter, and takes very little notice of hares and rabbits when winged game is present. This is a faculty to be cultivated in all spaniels, as most of them take to fur fast enough when allowed; and I have, I believe, before advocated entering young spaniels to winged game, instead, as is generally the case, of their being first entered to rabbits. —*An Old Judge of Spaniels in Land and Water.*

CLEVELAND DOG SHOW.

FOLLOWING is the premium list of the bench show to be held at Cleveland, O., April 2, 4 and 5; Champion English setter dogs $20, bitches the same; open, dogs $20, $10 and silver medal, bitches the same; puppies, dogs $7 and $3, bitches the same. Champion Irish setter dogs $20, bitches the same; open, dogs $20 and $10, bitches the same; puppies $7 and $3. Black and tan setters, same as Irish setters. Champion pointer dogs, over 55lbs., $20, bitches, over 50lbs. the same; open, dogs $20 and $10, small pointers the same; puppies, dogs, $7 and $3, bitches the same. Champion Irish water spaniels $10, open $10 and $5. Champion field spaniels (any color) $10; open, $10 and $5. Champion cocker spaniels (any color) $10; open (other than black) $10 and $5, black the same; puppies (any color) $5 and silver medal. Champion foxhounds, silver medal; open, dogs $10 and $5. Champion beagles, silver medal; open, dogs $10 and $5, bitches the same; puppies, silver medal. Dachshunde $10 and silver medal. Champion fox-terriers, dogs silver medal, bitches the same; open, dogs $10 and $5, bitches the same; puppies $7 and $3. Greyhounds $10 and $5. Deerhounds, $10. Champion mastiffs, dogs champion medal, bitches the same; open, dogs $15 and $5, bitches the same; puppies $5 and silver medal. Champion rough-coated St. Bernards, dogs, champion medal, bitches the same; open, dogs $15 and $5, bitches the same; smooth-coated St. Bernards the same. Newfoundlands, $10 and silver medal. Champion collie dogs, champion medal, bitches the same; open, dogs $15 and $5, bitches the same; puppies, dogs silver medal, bitches the same. Champion bull, champion medal; open, dogs $10 and $5, bitches the same. Champion bull-terriers over 25lbs., champion medal; open $10 and $5; under 25lbs., the same. Wire-haired or Scotch terriers $10 and silver medal; black and tan terriers over 7lbs., Dandy Dinmont and Irish terriers the same; champion Skye terriers (drop-eared) champion medal, open $10 and $5; prick-eared the same. Champion pug dogs, champion medal; bitches the same; open, dogs $10 and $5, bitches the same, puppies silver medal. Champion Yorkshire terriers, silver medal, open (over 5lbs.) $10 and $5; under 5lbs. the same. Toy terriers under 5lbs., $10 and silver medal; King Charles or Blenheim spaniels, Japanese spaniels and Italian greyhounds the same. Poodles $10 and $5. Miscellaneous $10, $5 and silver medal. In addition to the above there will be a large number of specials given which will be duly announced.

Major J. M. Taylor will judge the setters, Mr. J. M. Munson the pointers, and Mr. J. F. Kirk the remaining classes.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Bang. By Mr. J. R. Oughton, Dwight, Ill., for blue belton English setter dog, whelped November, 1883, by Dashing Lion (Dash II.—Leda) out of Queen Anna (Zanzibar—Lady Elgin).

Chiefley. By Mr. H. C. Miller, Hudson, N. Y., for red Irish setter dog, whelped Nov. 13, 1883, by Chief (A.K.R. 231) out of Doe.

Adam and Eve. By Mr. H. C. Miller, Hudson, N. Y., for black and white pointers, dog and bitch, whelped Sept. 26, 1883, by St. John (Snapshot—Belle) out of Folly (Rock—Sleaford's Fan).

Carter, Dan, Pint, Irish Dan, Irish Dick, Mike Carter, Nelly Carter and Fannie Carter. By Major Lovejoy, Bethel, Me., for red Irish setters, whelped Jan. 1, 1884, by his Trim (Ned Elcho—Ruby) out of his Roxie (Ned Elcho—Bridget O'More).

Countess Ringwood and Duchess Ringwood. By Mr. E. S. Hawks, Ashfield, Mass., for black, white and tan beagle bitches, whelped Nov. 21, 1883, by imported Ringwood (Ranter—Beauty) out of Music III. (Flute—Victress).

Burt, Scott, Crisp, Bro nie, Dan, Aberdeen, Lassie and Jennie. By Major Lovejoy, Bethel, Me., for Irish water spaniels, six dogs and two bitches, whelped Jan. 11, by Irish Bob out of his Irish Bess.

NAMES CHANGED.

☞ *See instructions at head of this column.*

Peg to Peg Peg. Liver pointer bitch, whelped Sept. 12, 1882 (Snipe—Ruby), owned by Mr. H. C. Miller, Hudson, N. Y.

BRED.

☞ *See instructions at head of this column.*

Jolly Daisy—Buckellew. Mr. W. A. Coster's (Flatbush, L. I.) English setter bitch Jolly Daisy (Druid—Jolly May) to his Buckellew (A.K.R. 30), Jan. 6.

Jolie—Buckellew. Mr. Theo. A. Gill's (West Park, N. Y.) English setter bitch Jolie (Lathrop's Dick—Gen. Ely's Sylph) to Mr. W. A. Coster's Buckellew (A.K.R. 30), Feb. 3.

Dinah II.—Master Wade. Mr. W. Wade's (Pittsburgh, Pa.) mastiff bitch Dinah II. (A.K.R. 13) to Mr. W. L. Jones's Master Wade (A.K.R. 157), Feb. 5.

Peg Peg—Knickerbocker. Mr. H. C. Miller's (Hudson, N. Y.) liver pointer bitch Peg Peg (Snipe—Ruby) to the Knickerbocker Kennel Club's Knickerbocker (A.K.R. 15), Feb. 13.

Sal—Bob. Mr. G. W. Amory's (Boston, Mass.) imported pointer bitch Sal to his imported Bob (Price's Bang—Princess Kate), Jan. 20.

Shoo Fly—Hector. Mr. Dan Storrs's (Lebanon, N. H.) beagle bitch Shoo Fly (Victor—Bess) to Hector (Victor—Beauty).

Syren II.—Arlington. Mr. A. S. Guild's (Lowell, Mass.) red Irish setter bitch Syren II. (Elcho III.—Mag) to Mr. C. Fred. Crawford's Arlington (Sam—Ruby), Feb. 14.

Red Lassie—Glencho. Mr. Thos. D. Husted's (Peekskill, N. Y.) imported red Irish setter bitch Red Lassie (Rory O'More—Queen Elfie) to Glencho (Elcho—Norcen), Feb. 13.

Franzelle—Fritz. Mr. Samuel Scranton's (Olneyville, R. I.) dachshund bitch Franzelle to Major Lovejoy's Fritz, Dec. 20, 1883.

Bridget O'More—Ned Elcho. Major Lovejoy's (Bethel, Me.) red Irish setter bitch Bridget O'More (Rory O'More—Lotta) to his Ned Elcho (Elcho—Stella), Jan. 1.

Lorna Doone—Prince. Dr. Spencer M. Nash's (New York) English setter bitch Lorna Doone (A.K.R. 39) to Mr. J. H. Goodsell's Prince (Pride of the Border—Petrel), Jan. 29.

WHELPS.

☞ *See instructions at head of this column.*

Gipsy Queen. Mr. H. P. Dortch's (Goldsboro, N. C.) English setter bitch Gipsy Queen (Gladstone—Clip), Feb. 11, fourteen (nine dogs), by Mr. J. C. Higgins's Dashing Monarch; eight dogs living.

Hornell Ruby. The Hornell Spaniel Club's (Hornellsville, N. Y.) cocker spaniel bitch Hornell Ruby (A.K.R. 67), Feb. 4, eight, by Obo II. (A.K.R. 432).

Irish Bess. Major Lovejoy's (Bethel, Me.) imported Irish water spaniel Irish Bess, Jan. 11, eight (six dogs), by Irish Bob.

Roxie. Major Lovejoy's (Bethel, Me.) red Irish setter bitch Roxie, Jan. 1, eight (six dogs), by his Trim (Ned Elcho—Ruby).

Kitty Mac. Mr. Jas. Lindsay's (Jersey City, N. J.) collie bitch Kitty Mac (A.K.R. 539), Jan. 2, seven (six dogs), by his Rex (A.K.R. 149).

Josephine. Mr. John E. Thayer's (Lancaster, Mass.) bull-bitch Josephine (A.K.R. 388), Feb. 7, six (three dogs), by his Tippoo (A.K.R. 390).

Bellissima. Mr. John E. Thayer's (Lancaster, Mass.) imported bull-bitch Bellissima (E.K.C.S.B. 11,931), Feb. 4, two dogs, by Slendermau (E.K.C.S.B. 6,553).

Dashing Lion—Jessie Turner whelps. English setters, whelped November, 1883, by Mr. G. W. Ballantine, Washingtonville, O., a black and white dog to Mr. T. C. Eldridge, Knoxville, Tenn.; a black and white dog to Mr. J. W. Slocum, Knoxville, Tenn.; a black, white and tan dog to Mr. J. E. Campbell, Knoxville, Tenn.; a black and white dog to Mr. A. E. Burche, Washington, D. C.; a black and white bitch to Mr. R. B. Johnston, Bellefontaine, O., and an orange and white bitch to Mr. Russell West, Washington, D. C.

Dashing Lion—Queen Anna whelps. English setters, whelped November, 1883, by Mr. G. W. Ballantine, Washingtonville, O., a black and white dog to Mr. J. R. Oughton, Dwight, Ill.; a black, white and tan bitch to Mr. C. Valentine, Edinburg, Ind.; a black, white and tan bitch to Mr. J. S. Vannatta, Shelbyville, Ind., and an orange and white bitch to Mr. B. F. Jones, Akron, O.

Maud Muller. Black and white English setter bitch (Rob Roy—Pocahontas), by Mr. G. W. Ballantine, Washingtonville, O., to Mr. Hugh Hill, New York.

Duke. Black and tan Gordon setter dog, whelped Oct. 22, 1883, by Dinks (Nat—Bess) out of Flirt (Cap—Gipsy), by Mr. J. F. Hartwell, Providence, R. I., to Mr. G. H. Dean, Jr., same place.

Dan. Black and tan Gordon setter dog, whelped Oct. 22, 1883, by Dinks (Nat—Bess) out of Flirt (Cap—Gipsy), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. H. B. Whitman, Providence, R. I.

Rad. Black and tan Gordon setter dog, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. Wm. Ayers, Providence, R. I.

Guess. Black and tan Gordon setter dog, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. C. N. Radborn, Bloomington, Ill.

Jennie. Black and tan Gordon setter bitch, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. F. Quintard, New Haven, Ct.

Jessie. Black and tan Gordon setter bitch, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. H. L. Hartwell, Providence, R. I.

Trim. Black and tan Gordon setter dog, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. E. H. Simmons, Erie, Pa.

Dexter. Black and tan Gordon setter dog, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. J. McGee, Worcester, Mass.

Dash. Black and tan Gordon setter dog, whelped Oct. 22, 1883 (Dinks—Flirt), by Mr. Geo. A. Ayers, Pawtucket, R. I., to Mr. M. J. Flaherty, Boston, Mass.

Weland Dick. Red Irish setter dog, whelped March 29, 1883 (Ned Elcho—Bridget O'More), by Major Lovejoy, Bethel, Me., to Mr. Chas. B. Lancaster, Boston, Mass.

Jack. Imported liver and white field spaniel dog, 2½ years old, by Major Lovejoy, Bethel, Me., to Mr. Elmer Brady, New York.

Dick. Imported liver field spaniel dog, 3 years old, by Major Lovejoy, Bethel Me., to Mr. Chas. Wing, Philadelphia, Pa.

Nick. Brown setter dog, age and pedigree not given, by Major Lovejoy, Bethel, Me., to Mr. Chas. Thomas, Brooklyn, N. Y.

Jim. English setter dog, age and pedigree not given, by Major Lovejoy, Bethel, Me., to Mr. W. White, St. Louis, Mo.

Ringwood—Music III. whelps. Black, white and tan beagles, whelped Nov. 21, 1883, by Mr. E. S. Hawks, Ashfield, Mass., a dog to Mr. Joseph Brady, Fall River, Mass.; a dog to Mr. L. S. Farrer, Bath, Me.; a dog and bitch to Mr. N. Elmore, Granby, Ct.; a bitch to Mr. Haven Doe, Salmon Falls, N. H., and a bitch to Mr. C. P. Ferguson, Springvale, Me.

Skipper. Liver spaniel dog, 2 years old (Dash—Bess), by Major Lovejoy, Bethel, Me., to Mr. Geo. Blanchard, Waterville, Me.

Wycliffe. Red Irish setter dog (A.K.R. 724), by Miss Ida F. Warren, Leicester, Mass., to Mr. Ewin Brown, Worcester, Mass.

Elcho—Meg whelp. Red Irish setter bitch, whelped July 21, 1883, by Elcho (A.K.R. 22) out of Meg (A.K.K. 425), by Mr. Benj. F. Clark, Manchester, N. H., to Mr. Frank Prendergast, Boston, Mass.

Nigger Tom. Black greyhound dog, whelped Aug. 5, 1883 (Charcoal—Queen Bess), by Major Lovejoy, Bethel, Me., to Mr. H. Savage, Brocton, Mass.

Joe. Fawn English pug dog, 4 years old (Jumbo—Topsy), by Mr. Jas. Mortimer, New York, to Mr. Geo. H. Hill, Cincinnati, O.

Echo. Red Irish setter dog, age not given (Elcho—Stella), by Mr. H. D. Ogden, Chatham, N. J., to Mr. Wm. DeLand, Fairport, N. Y.

Wallace. Red Irish setter dog, whelped June 5, 1883 (Kit—Bixby's Ruby), by Mr. J. H. Grimes, Somerville, Mass., to Miss Ida F. Warren, Leicester, Mass.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Annie Laurie. Black, tan and white collie bitch, whelped Aug. 28, 1882 (champion Marcus—Isle), by Mr. J. C. Faxon, Boston, Mass., to Mr. Wm. A. Faxon, same place.

DEATHS.

☞ *See instructions at head of this column.*

Chipps. Liver pointer dog, 7 years old (Cæsar—Moll), owned by Mr. Geo. Goodhue, Danville, Canada, Jan. 15.

Blackie. Imported black spaniel bitch, whelped Oct. 1, 1877 (E.K.C.S.B. 9,288), owned by Mr. F. F. Pitcher, Claremont, N. H., Feb. 15, in parturition.

NEW HAVEN DOG SHOW.—A large number of special prizes have already been offered for the New Haven dog show, and more are promised. Many of them are cash prizes varying in amount from $5 to $15, and include nearly all of the different breeds. There will undoubtedly be a large entry, and we would suggest to the management that many of the classes in which no distinction as to sex is now made, be divided into dog and bitch classes, or at least that they announce that this will be done in all cases where the number of entries will warrant.

ST. LOUIS DOG SHOW.—It is rumored that there will be a bench show at St. Louis this spring.

KENNEL MANAGEMENT.

☞ **No Notice Taken of Anonymous Correspondents.**

C. R. H., Manchester.—Select the one with the most courage.

C. M. S., Bethel, Conn.—From your description we should say that the ball will do no harm. Show him to your family physician, he will probably be able to inform you.

C. F. H., Clarksville, Mich.—Your dog has canker of the ear. Carefully wash out the ears and fill with the following mixture, gently kneading the base of the ear for a short time: Bromo chloralum and laudanum, equal parts, diluted with six times their bulk of water. If the case is not of too long standing one or two applications of this will effect a cure. We should not advise the use of kerosene.

THIRTY CENTS A WEEK, at age 25, buys a life policy for $1,000 in the Travelers, of Hartford, Conn. Cheapest first class goods in the market. Apply to any agent, or the home office at Hartford.—*Adv.*

MONTHLY LIST OF PATENTS.

For Inventions Relating to Sporting Interests, Bearing Date Jan. 22, 1884. Reported expressly for this paper by Louis Bagger & Co., Mechanical Experts and Solicitors of Patents, Washington, D. C.

291,533. Manufacture of Boats from Celluloid, etc.—C. P. Pitman, of Freehold, and H. Allaire, Allaire, N. J.

291,043. Ball Trap.—J. C. Parmalee, Pedalia, Mo.

291,891. Metallic Patch for Bullets.—G. V. Fosbery and Henry Pieper, Liege, Belgium.

291,123. Live-box for Fish.—Richard A. Lindsay, Baltimore, Md.

PUBLISHER'S DEPARTMENT.

FARNHAM'S AUTOMATIC TROMBONE WHISTLE is a handy little knick-knack which is growing in favor among sportsmen.

BETTER late than never get a box of Esterbrook's superior and standard steel pens. Are furnished in all the popular styles. Stationers have them.—*Adv.*

The ostriches of the Anaheim farm in California laid 305 eggs during the season from the 1st of May last until the 1st of October. The birds have been plucked twice since their arrival. The first clip in May last yielded $500. The clip in December yielded 2,500 quills of all kinds from eighteen birds, and is valued at $1,000.

SOME RIFLE QUERIES.

Editor Forest and Stream:

With your consent, I would propound a few questions for the consideration of the many amateurs and professionals, who eagerly scan all intelligent discussions in your columns of whatever relates to nice points of rifle manufacture and shooting. My object is to draw forth opinions and explanations, all the more stimulating to further investigation if they should be conflicting.

1. Who of your readers will furnish the most lucid and convincing answer to the question which may be put in this form. Shooting at 200yds., if the moving of the wind-gauge sight one-one-hundreth of an inch will vary the striking of the bullet in the target two and one-half inches, how much elevation or depression of the bullet will be caused by the raising or lowering of the peep-sight an equal distance? If the variation in shots, under the supposed conditions, would not be the same, up, down or lateral, let it be explained why. No off-hand, random speculation will solve this enigmatical problem. The rear sight is believed, from some cause, change of trajectory or other, to be the most sensitive in actual practice.

2. What reason for a positive opinion can be furnished, that the pushing of a bullet ahead of a cartridge, say one-eighth of an inch, will increase or lessen its upset when fired? Or, in other words, what effect on the expansion of a bullet into the grooves in the rifle, and its course after it leaves the barrel, may be attributed to a small air-space between the powder charge and the bullet?

3. Can the maximum and most uniform power of a 50-grain cartridge be obtained from the use of a No. 1 Winchester primer, or others of like size and force? Is not more fulminate required to penetrate and fully ignite the charge?

4. Using a paper-patched bullet, what condition of the barrel is more uniform and favorable to close shooting than that it be clean and dry? Is not lubrication unnecessary and objectionable because extremely liable to be variable, with however much painstaking?

5. Why are short and mid-range target rifles better or more easily manipulated with the wind-gauge sight at the muzzle rather than at the breech?

6. On the supposition that a paper-patched bullet should fit the rifling so that it can be pushed through with a gentle pressure, and not be deformed by the upsetting, how can it be placed beyond the shoulder of the chamber so its axis shall be exactly the same as that of the bore of the rifle? Or will the Gordian knot be cut by the authoritative assertion that the position of the bullet does not call for any such nice adjustment, but will right itself on the discharge of the gun?

7. Of the two, is not the sure and instantaneous shedding of a paper patch when a rifle is fired of more consequence than the exact proportion of tin to lead in the composition of bullets, never varying much from a medium standard? Patched bullets, I think, are largely of home manufacture, for economical considerations, if no other. But the saving will not be justified unless a process is followed which will insure accurate shooting. Stripping, and adhesion of paper beyond the muzzle, it is of the first importance to avoid. But by what precautions? When the bullet is in direct contact with the powder, no wad being used, is it not more certain to be discharged from the confining twist of the patch at its base?

8. Change of light being regarded as the most deceptive adverse condition with which the marksman has to contend, what concise practical directions can be given for mastering it? Careful observation would be safe general advice; but who that has profited by long and sharp watching will volunteer to part with any precious secret he has discovered, and lay down some simple rules for novices?

9. Is there no dissent in the high court of experts from what general use shows to be the prevailing opinion, that for short and mid-range target-shooting, with rifles of .38-caliber or upward, the most desirable powder is of the grade of Hazard's or Oriental FG, or Laflin & Rand's Creedmoor No. 5, these being of suitable grain, slow-burning, sufficiently strong, and of moderate cost? Leaving the cost out of the question, and balancing remaining advantages and disadvantages, is there no valid plea to be urged for the use of higher grades of powder for increased accuracy in rifle practice, such, for instance, as Hazard's No. 3, duck shooting? It may be that the final word has not been said on this matter, and that time will change the popular choice.

There are readers of the FOREST AND STREAM who are competent to handle the foregoing topics with skillful familiarity, and let it be hoped that they will respond to this call to elucidate what is too dimly apprehended by the great body of the rifle-shooting fraternity. If the oracles should be found to disagree, the fact may justify this communication as not having been dictated by stupidity. Something is reserved for a later day, when the result of this venture will have been disclosed. J. J. P.

WORCESTER, Mass., February, 1884.

Editor Forest and Stream:

From all these discussions does it not seem that the choice of a hunting rifle cannot be limited to one style of arm? To build a rifle for all round work is like building a yacht on a like plan. You can't do it for all conditions and uses. So let us have as great a variety as may be, and then every one can take his choice and blame himself if not satisfied.

But will some expert tell us which is best in loading a cartridge, to compress the powder or to leave it loose as possible?

Another thing, and more important it seems to me, is this: Place a sheet of paper close to the muzzle of a gun and fire through it, and the paper will show the marks of powder grains unburnt before they leave the gun. Light as well as heavy charges of powder will show this. Or, if fired in the dark the flame bursting in sight is a sign of powder burning outside the gun. What causes this? The powder is ignited at the bottom of the shell and, before all is burned, the expansion of part of it has forced the ball and some unburned powder out of the gun. Power is lost, you may get more power by putting in more powder, because more proportionately will be burned; but you won't get all the power of the powder. Is there any remedy for this?

Suppose you could ignite the powder just at the base of the ball, on the top of the cartridge, what would be the effect? G. F. W.

RANGE AND GALLERY.

THE ZETTLER RIFLE CLUB held its regular shoot on Feb. 12, 12-ring target, possible 120: P. Fenning 116, C. G. Zettler 116, V. Steinback 115, A. Lober 114, M. Dorrler 113, M. B. Engel, 112, D. Miller 111, C. Judson 111, H. Holges 110, B. Zettler 109, R. Zimmerman 108, T. C. Noone 108, H. Schutt 103, H. Fuckhaber 98, J. Adrian 92. Feb. 5, 12-ring target: M. B. Engel 115, J. H. Brown 115, M. Dorrler 113, T. Fitz 106, H. Holges 115, B. Zettler 107, C. Judson 115, A. Lober 112, C. G. Zettler 111, T. C. Noone 104, R. Zimmerman 110, H. Schutt 100, J. Adrian 104.—A. D. WARD, Sec.

NEWARK.—The match between the Zettler Rifle Club, of New York city, and the Frelinghuysen Club, of Newark, will take place on Monday evening, Feb. 25, at the range of the former. The conditions are: Ballard rifle, .22-caliber, 3lbs. pull, 10 men per team, 10 shots to a man, distance 85ft., Massachusetts ring target, possible 120 points. The return match will be shot on the Frelinghuysen range.

The fourth match of the Newark Rifle Association commenced on Monday evening, Feb. 11, at the Domestic range. The next match to be shot will be decided at the meeting of the N. R. A., the Warren and Plymouth Clubs having tied on score—420. The scores made last week were as follows:

Celluloid—W. A. Vreeland 42, C. E. Coe 42, H. Babbit 44, S. T. Simmonds 43, Wilzey 44, Brant 44, A. Erhard 47, Jackson 43, Puder 41, W. Coe 43—433.

Frelinghuysen—G. Williams 49, William McLeod 49, A. C. Neumann 49, S. Shackelford 48, R. Westerman 45, G. Zimmer 47, F. W. Lynn 47, G. Weigman 47, E. O. Chase 44, J. L. Tobin 43—468.

Warren—G. L. Freche 43, Theo. Miller 44, Wm. Nunley 43, Charles Waag 42, J. Schaeffer 38, Wm. Alexander 44, J. Wolf 44, L. Meyer 39, P. Keenan 38. Ed. Burns 45—420.

Domestic—J. E. Velsor 45, T. Porter 43, F. A. Valentine 41, J. Long 43, Wadams 43, Reynolds 44, Dainty 48, Wm. Connell 42, Jeffreys 43, Leitz 46—446.

Plymouth—J. L. Sommers 44, A. A. Baldwin 45, J. A. Fosters 38, H. L. Leibe 38, P. L. Sommers 44, C. H. Townsend 47, H. Grewe 42, G. M. Townsend 40, E. Pollard 44, J. B. McCullum 38—420.

The National Shooting Festival will be held in this city from June 9 to June 12 of this year.

BOSTON, Feb. 16.—There was the best attendance of shooters at Walnut Hill for a long time past, and the shooting was fine. In the early part of the day the flags hung motionless and limp, but about noon a light air sprung up from the east, but not enough of it to spo

the shooting. All that was necessary to get a bull was to hold on and the white disc was sure to be shown. On Friday next, Feb. 22, there will be shooting all day, and if the conditions are at all favorable there is sure to be a good crowd. All the current matches will be on, and as there are so many all can be sure of being satisfied. The following are to-day's scores:

Creedmoor Practice Match.

D Kirkwood	5555545445—47	J Payson (mil)	5445444544—43
C E Berry	5455445545—46	C O Reed	4444545341—42

SPLITTING CARDS turned edgewise to the shooter is considered one of the most difficult feats in pistol shooting. The mark presented is a hair line, and if the card is placed perfectly true the bullet cuts it into two pieces as cleanly as if the shears had been used. In some instances when the bullet just grazes the card, its path is marked by a lead line. At Conlin's Rifle, Pistol and Record Gallery, Broadway and Thirty-first street, this city, a playing card is exhibited in the record room, which has been grazed by two consecutive shots, showing the leaden lines in both cases running entirely across the card. This is a good illustration of the accuracy requisite for cutting the card. The bullet must not deviate either to the right or to the left the thickness of the playing card—but a "line" shot has more boundary, as a hit at any point counts equally well. The following are a few of the records kept at Conlin's gallery: Splitting cards, with rifle—E. E. Tiffany, 7 in 10 shots; George Bird, 7 in 10; Frederick Sands, 5 in 10; Geo. E. Rogers, 5 in 10; Maynard Bixby, 5 in 7; J. B. Blydenburgh, 6 in 10; H. H. Bishop, 4 in 7; W. B. Young, 2 in 3. With pistol—H. W. Wickham, 5 in 6 shots; W. M. Chase, 4 in 5; E. T. T. Marsh, 7 in 10; J. B. Miller, 5 in 10; H. W. Wickham, 3 in 5 shots at the word; Col. J. J. Dunne, 3 in 5; A. L. Caldwel, 2 in 4; Dr. E. T. T. Marsh, one card on second shot at rifle range. Dr. Marsh, 2 cards in 4 shots with ducking pistol; Mr. Wickham, 2 in 5. Dr. Marsh and Mr. Wickham both split 3 cards in 5 shots with .32-cal., Smith & Wesson revolver.

JAMESTOWN, N. Y., Feb. 16—Score of C. S. A. medal match, Creedmoor target, 200yds., possible 50; wind light at 7 o'clock; light, very bright. S. N. Ayres 45, N. J. Forster 45, A. F. Ward 43, W. H. Sprague 43, A. F. Warner 42, J. Haycock 41, R. H. Burns 41, J. R. Moore 40, O. H. Lilly 40, E. Mayhew 35, C. Salisbury w.—R. H. B.

A BIG PRIZE—Carlisle, Pa.—The Cumberland Valley Rifle Association of this place have decided on a contest in which they will offer as first prize a Steinway piano, H style 1, 7½ octave, price $700. Seven additional prizes will be offered amounting to $150. The shooting is to be at 100yds., the date in the near future not yet determined. The match will be open to all.—W. E. M.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE CLAY-PIGEON TOURNAMENT.

Editor Forest and Stream:

Any changes in or exceptions to the programme as printed and rules indicated thereon can hereafter only be made by the Executive Committee when they meet in Chicago. In answer to a few specific questions we desire now to explain existing rules as follows:

First—The traps must all be loaded after each shot.

Second—To determine which trap shall be pulled the trap judge or assistant will use the ordinary pool balls and bottle, drawing one ball for single and two balls for doubles, which he will show to the puller only, or a patent automatic pulling apparatus will be used. In double-bird shooting, therefore, any two of the five traps may be sprung.

Third—The direction (horizontal angle) of each trap shall be changed whenever it is reloaded.

Fourth—Ties between teams to be shot at 5 singles, 21yds. rise, and 2 doubles, 18yds. rise, all from 5 traps.

Fifth—A sportsman residing in a county in which there is no club, and desiring to shoot in the championship match with a club from some other county of which he is a member, can apply to the Executive Committee through us for authority to do so.

Sixth—Note this error in programme: Charge of shot "1¼ drams" should be "1¼ ounces".

THE LIGOWSKY C. P. Co.

PROPOSED NEW ENGLAND ASSOCIATION.—Providence, Feb. 1. —*Editor Forest and Stream:* At a meeting of the Narraganset Gun Club it was voted to issue a challenge to any or all gun clubs in New England, to shoot a friendly match at clay-pigeons, our object being to create a friendly rivalry between the shooters of the different States, and if possible to result in the forming of a New England Association. We should be pleased to join with other clubs in procuring a medal or trophy emblematic of the New England championship, and would prefer to shoot for some such prize. The conditions of the present match to be a team shoot, five or ten men on a side, as twenty clay-pigeons each man, the birds to be sprung from five traps, placed five yards apart, traps set on fourth notch, and the rise to be either 15 or 18yds., use of one barrel only. We would be pleased to have the first match take place on our grounds, when we shall hold ourselves in readiness to shoot a return match, if desired, at as early a date as possible. I hope some of the many clubs in New England will accept the above challenge in the spirit in which it is given, that of increasing the interest of trap-shooting in the New England States, and if we are defeated we shall have accomplished this, equally as well as if victorious. We are now enlarging our club house by raising it another story, making two comfortable rooms 24x12 with a balcony 6ft. wide extending the length of the building, so we shall not lack for accommodations for our visitors. Our grounds are very pleasantly located on Broad street, and the horse cars pass the building every hour (half hourly in the summer) it being about a half hour's ride from the center of the city. All challenges or acceptances may be addressed to C. F. Baldwin, Secretary Narraganset Gun Club, No. 2 College street, Providence, R. I., or to that best of all mediums for sportsmen, the FOREST AND STREAM.—W. H. SHELDON.

A NATIONAL ASSOCIATION.—Mr. J. E. Bloom recently said to a reporter of the Evansville (Ind.) *Argus*, speaking of the diversity of trap-shooting rules: "This is a subject that has given us great annoyance and labor. We have no national association in this country, to whose standard we might have reference. To-day Illinois shoots under one set of rules, New York another, Massachusetts a third, and so on. It has been our endeavor to establish a set of rules which would please all; rather, a majority—for there are always a series of chronic grumblers whom it would be impossible to satisfy under any circumstances. We announced this tournament last August, since which time we have been receiving suggestions from numerous clubs and individuals, many of which have been adopted. It will be our endeaver during the tournament to organize a national sportsmen's association, whose main functions shall be the framing of national sporting rules for each species of shooting, and the organizing of future annual tournaments. The rule that members of a team entered for the principal champion contest must be residents of the county from which the team is entered," was adopted at the suggestion of a Cleveland sportsman, and is intended to prevent the combination of the best shots of a State or section, in one team (which must be composed of five members of at least two months' good standing as such). Take the State of Illinois for example; it would be an easy matter to pick out five of her best shots from all parts of the State, and form a team which would be practically invincible, this would deter dozens of teams from country towns or local clubs from participating in the tournament. The rule is adopted to avoid this contingency. We organized this tournament not for the benefit of the few best shots of the several States, but for the delectation of hundreds of local amateurs throughout the country. We do not wish this to be a tournament for a dozen clubs—but rather for a hundred. I am confident that with this rule there will be over one hundred teams entered for this match. We already have entries from Florida, Missisippi, Massachusetts, Wisconsin, Ohio, Kentucky, Pennsylvania, New York, etc. Let the 'kickers' organize a club in their respective counties. How much more pleasure will result to all sportsmen, if local gun clubs were started in every county in the Union. There is a certain *bon comradeship* between devotees of the gun which only needs a feature of this kind, joined to a national organization to fully develop same, and which would result in establishing a 'body of men' scattered throughout the country, with whom thousands would take pride in co operating for any worthy purpose or emergency which might arise. A number of parties have endeavored to infringe upon our patents, but thus far unsuccessfully. By means of our patent process we are selling clay-pigeons cheaper at retail, than ordinary potters could manufacture them at wholesale. True, we sank $20,000 in devising this process and we have the same amount on hand with which to fight any parties who might try to infringe our patents. Moreover, we have the good will of the sportsmen of the country who now realize that while working for ourselves we at the same time cater to their sport—that we are doing more to foster tournaments than any set of men have ever done—or would do, were our patents overthrown."

FOUNTAIN GUN CLUB.—There was a fair attendance at the Prospect Park Fair Grounds, Brooklyn, at the monthly club contest. The birds were the strongest fliers we have had for a year, and it was quick work to stop them. The weather was fine and the shooting, with a few exceptions, remarkably good. Appended is the score:

Regular Monthly Badge, 7 birds. 5 traps, both barrels.

Class.

B—John Rathgen, 25yds.	1	1	1	1	1	1	1—7
A—W. McLaughlin, 27yds	1	1	1	1	1	1	1—7
B—C. R. Weed, 25yds	1	1	1	1	*	1	1—6

C—H. Altenbrand, 23yds	1	*	1	1	0	0	*—3
C—J. Fried, 21yds	1	0	0	0	0	0	1—2

Winners: Class A, Mr. McLaughlin, 7; B, Mr. J. Rathgen, 7; C, Mr. O. Sarony, 5.

*Dead out of bounds.

Sweepstakes, 25yds. rise, 3 birds

C R Weed	1	1	1	1	1	1	1—7
John Rathgen	1	1	1	1	1	1	1—7
T Livington	1	1	1	1	0	1	1—6
Dithifson	1	1	1	1	1	1	1—7
Place	1	1	0				—3
W Cherry	1	1	0				—3
A Eddy	1	0					2
H Hoermans	1	0					2
W Hughes	1	0					—2
O Sarony	1	0					—1
E Brown	1	0					—1

B. McVaughlin, C. Fisher and H. Altenbrand missed first. Dr. Weed and John Rathgen divided; Mr. Ditifson won 3d money.

RAMBLER.

BLACK VS. WHITE.—I must record a great event in the sporting annals of 1884, being no less than a match for the championship of Flatbush and a sister burg—Flatlands Neck. The former was represented by four white gentlemen, and the latter by four colored gentlemen, the arrangements being to shoot with four men on a side, 30 glass balls apiece, 18yds. rise, Bogardus trap, one colored and one white judge, ditto scorers. Stakes—Championship and a keg of lager. Below I give the detailed summary:

Flatlands Neck Team.

T Powers, M L	1	0	1	0	0	1	0	1	0	1	0	1	1	0	0	1	1	1	0	0	1	0	1	—15
John Powell, B L	1	1	1	0	1	0	0	1	1	0	1	1	1	1	1	1	1	1	0	1	1	0	1	—21
T Jackson, M L	1	0	1	0	1	0	1	1	0	1	1	0	0	0	0	1	1	0	1	1	0	1	1	—15
S Anderson, M L	0	1	1	0	0	0	1	0	1	1	0	0	1	0	1	0	0	1	1	1	1	0	0	—16—67

Flatbush Team.

Skidmore, M L	0	1	1	1	0	0	0	1	1	1	0	1	1	1	1	1	0	1	1	1	0	0	0	—15
H Cook, B L	0	1	1	1	0	0	1	1	1	0	1	1	0	1	1	1	1	1	0	0	0	0	0	—20
D Rumph, B L	0	0	0	1	1	1	0	0	1	1	1	0	1	0	1	0	1	0	0	1	1	0	0	—15
Hagaman, M L	0	0	1	0	1	0	1	0	1	1	1	0	1	0	1	0	0	0	1	1	0	1	0	—15—65

The best of feeling prevailed even after the announcement of the result, and the outcome of this good-fellowship is a return match at an early day. Will report.—SEAWANHAKA.

KNOXVILLE GUN CLUB, Feb. 15.—The first regular match for the Ligowsky Champion Medal this season, resulted as follows. There was a strong wind and the birds flew with unusual velocity from the fourth notch at 18yds. rise:

C Hebbard	1 0 1 0 1 1 1 1 1 1 1 0 1—12	A E Mead	0 1 1 0 0 0 1 0 1 1 1 0—7
T Armstrong	1 1 1 1 1 0 1 0 1 1 0—10	M O French	0 0 1 1 0 0 0 1 1 1 0 0 1 1—7
J C Duncan	0 1 1 1 0 1 1 1 1 0 1 0—10	J W Slocum	0 0 1 1 0 0 1 1 1 1 0 0 0 1—7
T C Eldridge	1 1 1 1 1 0 0 1 0 1 0 1 0—10	C Deaderick	1 0 1 1 1 0 0 0 0 0 0 0 1—6
S B Dow	0 1 1 1 1 0 1 0 1 0 0 1—9	C Woodbury	0 0 0 0 0 0 1 0 0 1 0 1 0 1—4
W Jenkins	1 1 0 1 1 1 1 0 1 0 0 0—9	M McClung	1 1 0 0 0 0 1 0 0 0 0 0 0 0—3
H Worsham	0 1 0 1 0 0 0 0 1 1 1 1 1—8		

EAST PROVIDENCE, R. I., Feb. 12.—There was a very large attendence at the meeting of the Watchemoket Gun Club, many being present from Providence, Pawtucket and other places. The following was the score for the clay-pigeon cup, best out of a possible 20, from five traps:

E S Luther	1 1 1 0 0 1 1 1 1 1	10	10	10	11	01—13
E W Tinker	1 1 1 1 1 1 1 1 1 1	10	11	11	10	11—18
O Payne	1 1 1 1 1 1 1 1 1 0	11	10	11	10	00—15
George Barney	1 1 0 1 1 1 1 0 0 0	10	10	00	00	11—18
Mr Saulsbury	1 1 0 1 1 1 0 1 0 0	10	10	10	10	10—11
Isaiah Barney	0 1 1 1 1 0 0 0 0 1	10	01	11	11	10—13
T W Penney	1 0 0 1 0 0 1 0 0 0	withdrawn.				

The cup goes to Mr. Tinker for the first time.

This cup has been won by Mr. Luther four times in succession, and as it is almost impossible for any one member to win it five times in succession, it is thought advisable at the next regular meeting of the club to have it shot for in the same manner as the Ligowsky State badge, now held by the Narraganset Gun Club of Providence.

For the glass-ball cup the following was the score, best out of a possible 20:

E S Luther	1	0	1	0	1	1	1	0	1	1	0	0	0	1	0	0	0	0	1	1	0			—10
George Barney	1	1	1	0	1	0	1	1	0	1	1	1	1	1	1	1	0	1	0	1	0			—15
Isaiah Barney	0	0	1	1	1	1	0	1	0	1	0	1	1	1	0	0	0	1	1	0	0			—11
T W Penney	1	0	1	1	1	0	0	0	1	1	1	1	1	1	1	1	0	1	1	0	1			—15
E W Tinker	0	1	1	1	1	withdrawn.																		
C Payne	1	1	0	1	1	withdrawn.																		

This being for resident members only, it was awarded to George Barney, for the first time.

There was then a sweepstakes shoot, five clay-pigeons being used by each contestant. S. E. Smith took first money, E. W. Tinker second and George Barney third. Except for the fog, the day was very favorable for the practice.—O. J. R.

YONKERS, N. Y.—Following are the officers of the Terrace City Sportsman's Club: John E. Rockwell, President; John Hien, Vice-President; John L. O'Brien, Secretary; Simon Belzel, Treasurer. Executive Committee—John Dearman, William Gormley, James Thompson.

SHOT FOR CLAY-PIGEONS.—Buffalo, O., Jan. 26.—In this week's issue you invite your readers to send their opinions as to the best size shot to use in clay-pigeon shooting. I have shot at them considerably, and I should say that good results can be obtained by using either 6s, 7s, or 8s. It depends something as to when they are shot at, too. The shooter who catches them quick can safely shoot smaller shot than he who lets them get further off before shooting. My experience with my gun (an 8¾ chokebore) is that with 4 drams good powder and an ounce of No. 6 shot, I make better scores than when loaded any other way. In our opinions here the clay-pigeons make the best trap-shooting, far surpassing glass or puff balls, and fully as hard to hit as live pigeons, without being open to the objections against live pigeon shooting.—F. S.

THE NARRAGANSETT GUN CLUB, of Providence, R. I., will raise their club house one story, making a spacious dining hall above, while the lower part of the house will be used as before for the accommodation of the shooters. The club intends holding a series of tournaments as soon as it is completed. The treasurer's report shows a flourishing condition of the club as we are out of all debt, besides having quite a handsome balance in the treasury. There is also much enthusiasm among the members, and the season of 1884 promises to be the liveliest we have had here for a long number of years. The club will be pleased to arrange a friendly match with any New England club, five or ten men on a side, to shoot clay-pigeons.—W. H. S.

Yachting.

FIXTURES.

May 24.—Boston Y. C., Opening Cruise.
May 30.—Knickerbocker Y. C., Spring Matches.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.
June 10.—Atlantic Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Hull Y. C., Club Meet.
June 28.—Boston Y. C., Ladies' Day.
July 12.—Hull Y. C., Club Meet.
July 12.—Boston Y. C., Second Club Match.
Aug. 9.—Hull Y. C., Club Meet.
Aug. 9.—Boston Y. C., Open Matches, all clubs.
Aug. 23.—Boston Y. C., Third Club Match.
Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

SHARPIE RUDDERS.

Editor Forest and Stream:

It seems to me plain why sharpies carry their peculiar rudders. A shoal boat, not being able to have its rudder go deep down in the water, in order to get a grip, must have it reach out aft. Now any one who has handled a shoal skiff boat, with a big wide rudder, and has afterward handled the tiller to a balance rudder, can testify to the ease with which the latter works in comparison. The strain on the rudder stock and tiller head is also less, and consequently allows a smaller and neater rudder stock. Many also claim that a boat works quicker with a balance rudder; in giving a cant to a boat which has sternway on it is very effective, and it also will almost instantly stop a boat when shooting up to a wharf or buoy, with too much headway on. On one boat at least, that I know of, the dropping the rudder down lower, as allowed by pins through the stock, helps greatly in a light breeze. I think these qualities explain why "sharpies have always" used them. It is not the absence of a skag, for I know three sharpies which have skags and still use the balance rudder because of its good points, and with a skag there is no hitting bottom, catching snags, etc. L.

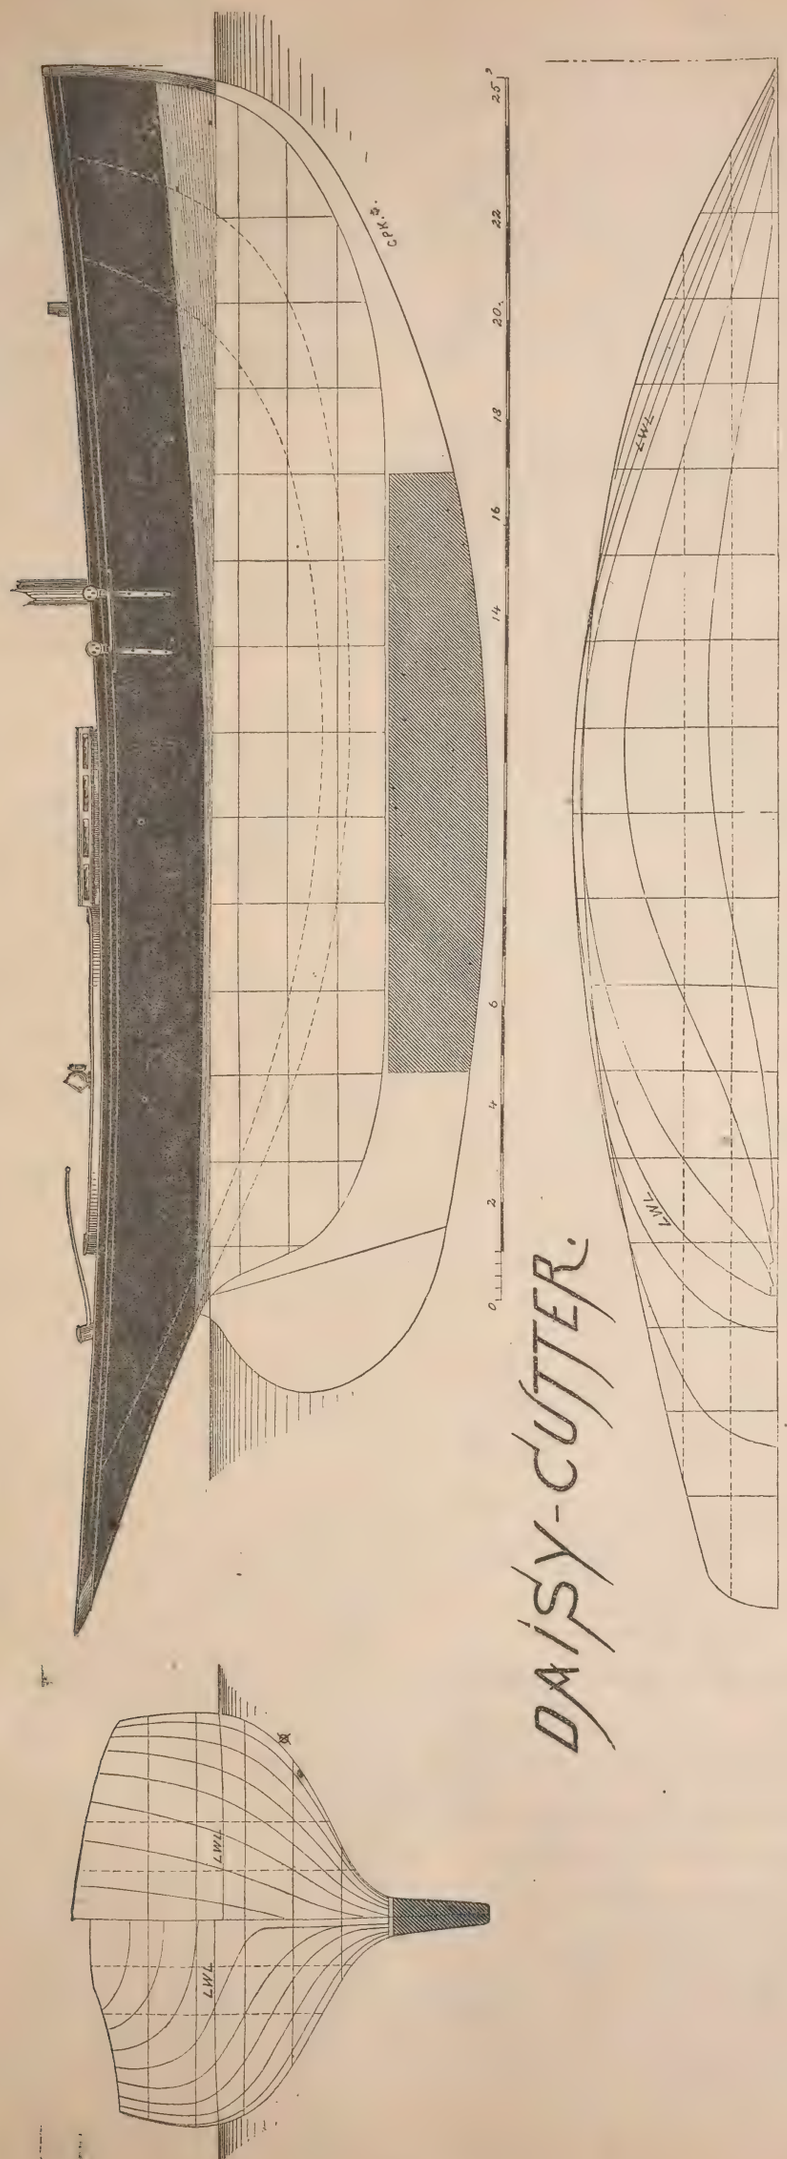
NEW ENGLAND YACHTING ASSOCIATION.

AT a preliminary general meeting, Feb. 7, Parker House, Boston, organization was effected as follows: Clubs represented—Bunker Hill, Beverly, Boston, Dorchester, Eastern, Jeffries, Hull, Lynn, Portland, Salem Bay, South Boston and West Lynn. Mr. Charles F. Loring, Boston Y. C., was elected chairman and Mr. Peleg Aborn, Hull Y. C., secretary. The committee on plans reported as under: First. The name shall be the New England Yachting Association. Second. That the association be governed by suitable by-laws providing for its permanent officers and their election. Third. That a system of uniform measurements and time allowances for yachts belonging to the several clubs represented in the association shall be adopted, such rules to apply only to union regattas. Fourth. Recommending a uniform code of signals for the use of the yachts of the clubs belonging to the association. Fifth. Providing for the continued membership of clubs in the association and the admission of new clubs to membership therein.

Officers were selected for the present as follows: President, Chas. F. Loring, Boston, Y. C.; Vice-President, J. P. Phinney, Boston Y. C.; Treasurer, B. W. Rowell, West Lynn Y. C. A committee to draw up by-laws was appointed, comprising the following gentlemen: W. Lloyd Jeffries, Bev. Y. C.; C. A. Perkins, H. Y. C.; L. M. Clark, D. Y. C.; Parkman Dexter, D. Y. C., and Dr. John Bryant, E. Y. C., to which the chairman, C. F. Loring, B. Y. C., was added *ex-officio*. Another committee to recommend sailing rules and time allowance was selected by the chairman, to report at next meeting, Feb. 21, at same place. This committee is composed of: D. H. Rice, S. B. Y. C.; P. M. Bond, B. H. Y. C.; Sidney Burgess, E. Y. C.; Thomas Dean B. Y. C.; E. C. Neal, L. Y. C.; C. F. Loring, B. Y. C., *ex-officio*.

SMALL YACHTS.

Editor Forest and Stream:



I read with great interest your advice to single-handed yachtsmen, and will give you the figures of a 23ft. catboat I now sail, and which has proved in three years' actual experience to be what I consider the kind of a craft needed for comfort and safety. She is 3ft. 6in. deep and draws 3ft. 3in. without centerboard, will work well in a heavy sea without board. I use it only in racing. The box makes the table, leaves to turn up when used as such. Cabin is 8ft. long, 6ft. wide, 4ft. 3in. high. Transoms 7×2ft.; lockers for stores and dunnage; cockpit, 6×5ft., tight and with scuppers. Doors to cabin made to shut watertight. House is 4in. high and 6ft. wide, leaving 2ft. gangway each side. One thousand pounds lead are fitted to the skin and 2,000 trim on top, all being well below water line. Spars for cruising are mast 22ft. deck to hounds, 15ft. gaff and 26ft. boom. Head of sail peaks to an angle of 75 degrees. For reefing the tack earing reeves through a sheave on the goose neck of the boom and leads to a cleat. The clue pennant reeves through the cringle on leach and down again through cheek sheave on boom, so that the sail can be hauled down to first or second reef while the boat is in stays. Her floor is quite sharp, which makes her easy in a seaway. At anchor an awning is stretched over the boom and stopped tent fashion to sides of cockpit, making a space for berthing two in moderate weather. She is much the same style of boat I commenced my yachting with some fifty years ago, and although I have built many large yachts during that time I am now more than ever satisfied that there is more pleasure and sport in being actual master of a small boat than being under the guardianship of a professional skipper and steward. I would recommend all young persons who wish to enjoy a week's cruise on their own hook to build a staunch, deep-draft and well-ballasted boat with snug rig and take comfort. The danger of driving your boom under water in a cat can be obviated by making the topping lift fast to the outer end of boom, reeving it through a block at masthead and leading it through a sheave on deck to cockpit. You then can set taut without trouble and lift the boom as desired. BALLAST.

Editor Forest and Stream:

My idea of a single-hand yacht is a cabin large enough to eat, sleep, cook and dress in comfortably, in a hull which will combine the greatest possible speed and safety. The question is, What is the best form of hull? Is this small yacht of the future to be a cutter or a catamaran, or what modification of these extreme types? SERANG.

[We know of no boat which meets the wants of the single hand for best average work and regular yachting purposes better than the small cutter or yawl of 18, 20 or 22ft. loadline, with about 6ft. beam, with nearly all the ballast on the keel. Such boats combine the most room, safety and greatest ability on a small draft from 4 to 5ft. Attempts are frequently made to save some of the draft and displacement. All such attempts only rob the boat of just what you seek, and it is not good policy to save a few dollars at the spiggot and lose at the bung what is most worth having in a small boat, power and ability with permanent habitation on board. We have published a number of suitable designs, not to be followed strictly, but to afford a cue to the chief points which should be given prominence in such boats. Catamarans on a small scale are of no account, being thrown out of trim and lacking in power, as well as without accommodation].

ANNA.—This Baltic cutter, hailing from Kiel, designed by Constructor Saefkow, of the German navy, has already been noticed in this journal. Her lines appear in the London *Field* for Feb. 5. She is a handsome, fair yacht all through, and although but 7.43ft. beam on 41ft. loadline, is described as a specially stiff, able and dry boat of superb seagoing qualities. Displacement 18.7 tons, of which 0.620 is represented by 11.5 tons of lead ballast, 10 tons thereof being on the keel. Draft 8.2ft. Lower sail area 1,333ft., which is considered rather snug. Center of gravity of boat and equipment 1.75ft. below center of buoyancy, and meta-center 1.1 above C.B. Statical stability at 35 degrees is 29.8 foot-tons. Maximum stability at 130 degrees. Ballast on keel is 18in. thick, 28in. deep and 14ft. long, or say one-third loadline. This concentration accounts for her extreme dryness in a sea. Least freeboard to plankSheer is 2ft. 9in.

THE DAISY.

THE lines of this English-built yacht, soon to show her number on this side of the Atlantic, will prove of great interest in comparison with the keel sloops which have of late come into such general favor in our own waters. The Daisy was built to sail under the loadline rule temporarily enforced in Southampton waters and immediate neighborhood. The influence which that rule has upon modelling is at once detected in the close resemblance existing between the cutter Daisy and the most approved keel sloops of the East. Considerable beam and depth, with a deep keel and great displacement to act as a counterpoise to the beam and a large rig to correspond, are the principal features of all such boats. The Daisy has, however, much the advantage in point of style, as appears from her graceful sheer, straightish topsides and long fantail. With her rocker keel, flush deck, free from encumbering house and full cutter rig, she is a much smarter and more ship-shape craft than the roundish sloops of the East, which are all of a heap and stubby, as well as cheap in rig and equipment.

The fact that small boats on a given length are at a disadvantage with large boats in respect to power and general ability quickly forced itself upon the conviction of builders abroad, and they were not slow to take advantage of the weak spot in the rule by adding to the size, weight, draft and rig of boats in succession until the maximum bulk on the length was attained by experiment. Up to this maximum every racer must be built and in face of the prejudice for bulky boats shown by the length rule, all forms of more moderate proportions are driven out of existence. To meet the peculiar exigencies of the length rule the Daisy was designed by Mr. Joseph M. Soper, whose artistic eye and practical proficiency materially promote the good fortunes of the famous yard of John G. Fay & Co., of Southampton, where scores of handsome yachts have risen in frame to give excellent accounts of themselves in later days.

Daisy was built in 1882, and in the Solent matches won for herself an enviable record. She is certain to receive popular indorsement on this side of the pond, for she has all any one can ask on 25ft. loadline. It is possible she will be raced now and then in the Seawanhaka Corinthian matches and we also hope to see her voyage East and try on some of her own breed of American origin. Her principal occupation, however, will be knocking about the coast anywhere between Halifax and the West Indies. The spars of the Daisy are necessarily of the most liberal proportion, so that to mitigate their influence in pitching, the mast has been stepped well amidships. As we propose to publish cabin plans, building section and rig, it will be enough here to add the chief dimensions and elements.

Length over all	32ft.
Length on loadline	25ft.
Beam loadline	8ft. 6in.
Least freeboard to plankshear	2ft.
Greatest draft	5ft. 9in.
Displacement, long tons	7.86 tons.
Coefficient fineness to rabbet	0.26
Ballast on keel, lead	4.38 tons.
Ballast inside, lead	0.25 tons.
Ratio of ballast to displacement	0.59
Area loadline plane	149sq. ft.
Area midship section	20.75sq. ft.
Area longitudinal section, with rudder	120sq. ft.
Area wet surface, with rudder	328 sq. ft.
Area three lower sails	862sq. ft.
Center of sails abaft middle L.W.L.	1ft.
Center of lateral resistance ditto.	1ft. 5in.
Lower sail per sq. ft. wet surface	2.69sq. ft.
Wet surface per long ton displacement	40.7sq. ft.

AROUND LAKE ONTARIO IN THE KATIE GRAY.

THE first cold winds of fall bring to the yachtsman's mind the many pleasing memories of summer's visit, and hasten him to his pen, that in the savage blows of winter and in the seasons to come the cruise may lose none of its happy recollections. Cruises in all kinds of yachts are composed of incidents and day to day life, similar one to the other, but as we think we had about the jolliest crew afloat, harmonious in all things, and the famous record of our sloop for speed, our trip around Lake Ontario and down the St. Lawrence River may interest some of our salt-water brother yachtsmen as well.

A four days' blow, commencing on the night of the 2d of August, drove us back pell mell from about eight miles up the lake. G. D. and the Major, strong fellows constitutionally, "went over the side of the ship and heaved their lives away."

For three days our only communication with the shore was by signal code. At daylight, Aug. 7, we were off, and with a heavy sea and wind dead ahead, we made Fair Haven, fifteen miles, in one stretch. We could have fetched ten miles further, but we were hungry, so we ran in and cooked a square dinner. At daylight next morning we were still working to windward, having thrashed fifty-one miles. All night we were just able to keep a tow abreast of us, which we found in the morning to consist of the tug C. P. Morey, Capt. Fred. Papa, drawing three coal barges. The wheelman on the last barge caught our towline, and at 7 A. M. we were in Charlotte, seven miles from where we lowered our canvas.

Aug. 8.—A hasty change from our heavy clothing into our yachting uniforms, a rush for the train, and with the first mate missing, Rochester was soon reached. Dined at the Powers Hotel. The evening paper mailed to us at Toronto read, The Rochester *Post-Express* contained the following: "The yacht Katie Gray, of the Oswego Y. C., arrived at Charlotte this morning at 7 o'clock from Oswego. The captain of the Katie Gray is Vice-Com. W. B. Phelps, Jr., and the crew is composed of G. D. Hart, J. D. Henderson, R. G. Majorossy, and J. P. Phelps. They are passing the day in Rochester, calling on their friends and making hosts of new acquaintances. Their yacht is a very fine and handsome craft, and manned by genial, pleasant gentlemen." At 3 P. M. we were standing out into the lake; dropped Capt. John Parsons at the lighthouse. Wind fell when a few miles out. Becalmed all night, not a breath of air. Our little clock rang the bells through four watches before our bow cut the water.

Aug. 9.—A more beautiful day or favorable breeze could not be wished. As the dishes were being cleared away a N. E. breeze set in, and steadily increased to a lively air, and held its own all day. We were heading W. by S.; spinnaker did good service. Passed Oak Orchard 9 A. M.; Thirty Mile Point 11:45 A. M.; Olcott 1:35 P. M.; Wilson 2:35; Niagara River at 4. After passing Niagara the wind gradually fell until it reached a calm, leaving us unmanageable half a mile from Port Dalhousie. This was quite a disappointment, as we had "slicked up" and blacked our boots, etc., and it looked as though the night was to be spent afloat. In the course of an hour all hands gave a slue to their trousers, and the Major skipped a trialaloo on the cabin top as a light air swept us into the piers at 7:30. Two hours later the schooner Preston came in. We beat her eight hours in the 140 miles. Chartered an old springless democrat and drove three miles to St. Catherine's. The firemen were having a big celebration. Companies from both sides were in the long torchlight procession. The "ons" of the country folk and the "ahs" of the city fry were intermingled with howling brass bands as the rockets bursted in air, and flaming Niagara spread her volume of colored fire. We were taken for firemen by the uninitiated, and had the freedom of the grounds. As we drove back, the colored lights on the bridges and banks of the new Welland Canal presented a very striking picture.

Aug. 10.—Under way at eight bells; wind S.W. We could just squeeze on our course. Breakfast was scarcely partaken of when the breeze hauled a little more southerly, so that our jibtopsail pulled nicely. Met steamer Hastings with large party aboard. The day was warm and the wind very fickle, leaving us entirely when a few miles from Burlington Piers. The skipper pulled away a mile ahead in the dingey. The Major slept. J. D. took the polish and scoured the brass work. It was 5 o'clock as the great railroad bridge swung to let us through, and 6 as Capt. Monck, of the yacht Coquette, rowed out and boarded us and piloted us into moorings. Our snug uniforms were speedily rifled out of our satchels, the yacht was put in complete order, and under the wings of Capt. Monck and Mr. Charles Goodeve the Hotel Royal dining room was taken possession of, and right royally we enjoyed our meal. At this hotel we found everybody obliging and alive to the wants of the visiting strangers. A merry time we had ashore, and we feel under obligations to Messrs. Monck and Goodeve for their kind attention.

Aug. 11.—Market day. If you have been up early in the morning in a Canadian city, and witnessed the uncovering and locating of the thousand and one articles, you have seen something that will enhance the flavor of your morning coffee. It is Fulton and Washington Market on wheels. The plump little cackling chickens, the big fresh eggs, the rosy complexions of the pretty farmers' daughters proved such an interesting scene that cold breakfasts awaited two of our crew. Our skipper had a narrow shave from total annihilation. He was presented to Hamilton's fairest belle, and for many miles at sea he could be discovered gazing into Ontario's blue depths, silent and sad. After dinner at the hotel, we took the street car to the yacht, bade our friends good bye, and with a head wind, 6 o'clock found us going through the draw at Burlington Beach. In the evening we gave a display of fireworks in front of the hotel. Midnight we let go with three Hamilton gentlemen aboard, who were to join us in the run to Toronto. A light air carried us about six miles and there dropped us for the night, a repetition of our previous experience off Charlotte.

Aug. 12.—At eight bells a light breeze sprang up from the eastward

dead ahead, and held all day. A flat-sitting gafftopsail was spread, and we began to knock the miles off between Toronto and Hamilton. As we sighted Oakville a fleet of nine sails was coming out. We soon found ourselves working through the Toronto Y. C. squadron bound for Hamilton. The leading yacht was a small one, and appeared to be doing more miles than the large ones. A salute was exchanged, and after signaling the Guinevere with our code signals to heave to and dine with us, we received signals in return stating that time was pressing and position in the line enviable. Our attention was directed to the large yachts as weather-gage of us six or seven miles, the Verve and Alarm. We hauled sheets a bit flatter and went for them. During the next four or five hours they were hidden from our sight by a misty atmosphere. We gave them a long chase, and in the afternoon when we made them out they were well to leeward of us. The American shore was sighted as the air cleared. We came about and had an attack of calm, but drifted into Toronto Bay, and made fast to the Queen's wharf for the night.

AUG. 13.—At daybreak the mainsail was hoisted, and we shot along the city front until opposite the Union Station, where we dropped anchor. Registered at the Queen's Hotel and inspected our mail. It was quickly noised about among our friends that the Katie Gray was in—so we were soon in good and hospitable hands. Hanlan's Island was visited among many other points of interest. We met a great many members of the Royal Canadian and Toronto yacht clubs. All were very hearty in their greeting.

AUG. 14.—At 3:30 P. M., after sailing the yacht clear of the fairway for passing steamers into which she had dragged, we put everything in seagoing order and shaped a course for Coburg, 65 miles distant; wind W. One of our crew was too much taken up with Toronto to sail with us. He remained behind, with the understanding that the night train would overtake us at Whitby or Coburg. At dusk the wind came around E. E. by N., making close work for us to hold our course. The moon was out in a clear sky, the night was perfect, and at 7 A. M.

AUG. 15.—We were abreast of Port Hope. The wind hauled E. and in a short time a heavy chop sea drove the Major from the stove, where he was using three different languages to induce the coffee-pot to remain on the fire. As we shot into Coburg piers our lost messmate was discovered astride of a lumber pile. He said we looked very pretty as we tossed the caps off the waves, rushing along under reefed canvas. By the way, our sails were brand new bent the day before we left home. They were made by Sawyer, of New York, and were remarked in every port as being the best sitting sails seen on the lake. Coburg is advancing to the dignified title of a summer resort. Many Americans, mostly Southerners, were at the hotels. The Arlington is a good hotel in the distance. At the Dunham House the genial "William" provided everything in a satisfactory manner. A dog-cart was procured, and a drive of seven miles, in which we all went to sleep, took us to Port Hope. The "Sons of England" were celebrating some anniversary on the fair grounds, where we proceeded. One of the crew stole the dog-cart and, with two of Port Hope's fairest daughters, drove into town. The skipper was discovered emerging from St. Lawrence Hall, and was soon under full sail behind the steppers. One train after another bore the crew to Coburg leaving G. D. and the skipper in full possession of dog-cart and young ladies. In the somber hour of midnight two youths might have been seen leisurely walking their horses down the smooth country road which they supposed was leading them into Coburg town. Alas, it measured many a crooked mile ere the lights of the town were discerned. The yacht Cygnet had arrived in port from a cruise to the St. Lawrence.

AUG. 16.—In the morning Mr. Hugh C. Dennis, of the Cygnet, called on board and invited our party to dine at Strathmore, the beautiful country seat of his father-in-law, Judge Clark. After a pleasant drive of a mile along the shores of the lake, we were presented to the captain's family, and as agreeable an afternoon is not often logged. In the early evening a large party assembled on the lawn of the rector's residence with music and brilliant illumination. At 2 o'clock we boarded the yacht and found the wind, which had been ahead all day, had hauled to the westward, and although the sky looked dark and threatening, we prepared to get underway.

AUG. 17.—Daylight we were under full sail rapidly skimming along down the Canadian shore. Sighted Scotch Bonnet at four bells. The wind veered to the southward and freshened to a blow. Two reefs in mainsail put us in shape to stand it. For half an hour it was a question whether we would weather the Bonnet or run for Presque Isle. G. D., who was in the watch below was awakened by a green sea crashing in through the forward deadlight upon his slumbering form. It was a hard struggle to hold up to weather the Bonnet, but we did it, and starting our sheets, with the heavy sea after us and the wind S.W., we knew we were booked for a fast run. Passed Salmon Point at 9:30. Point Peter at 10:10. Passed close to a schooner ashore. Passed South Bay point at 12:30 noon. Such a sail as we were enjoying would not be met with once in years, the wind and sea seemed to have a perfect understanding, for in spite of the heavy rollers and two-reef breeze there was no yawing, no sliding down a sea and fetching up, except on the part of the Major. Kingston, at the mouth of the St Lawrence, was reached at 4 in the afternoon watch. After a stop of half an hour for ice and mail we headed down the river. The wind had now let up considerable, gafftopsail and balloon jib were set. A mile above Wolf Island light we passed the Gracie, Mr. Roy, bound for Belleville. We hauled up and the skipper took the dingy and made a short call aboard the Gracie. Both yachts were in a hurry to reach their destinations before dark. At eight bells we were slowly drifting by Clayton. At 9 o'clock we fired a rocket over the Hub House, having traveled 120 miles since daylight. Took part in a hop in the hotel dining-room.

AUG. 18.—Made sail for Alexander Bay at 10 A. M. As we rounded to under the Crossmon House, a gun from the decks of the steam yacht Sport echoed among the islands and announced our arrival. The Sport is a handsome side-wheeler, and although she was beaten in a match race for $1,000 by the Ranger of Ogdensburg, she is a very fast steamer. The Thousand Island House did not seem as homelike as in former years, as our accommodating landlord, Staples, had gone from the scene of six years' triumph to preside over the destiny of Willard's. At midnight a steamer came alongside and towed us to the Hub House, seven miles, against the swift current. We spoke the watch on the revenue cutter Bibb as we swept along under the Wellesley caravansery.

AUG. 19.—Sail was made in the morning, and boarding the revenue cutter a pleasant hour was spent with her officers. After dinner the guests of the Hub House were invited by the proprietor to board the steam yacht Van Horne for a trip among the islands. The steamer proved too small to accommodate all, so we volunteered the services of our yacht. A large number of ladies and gentlemen were comfortably and cosily stowed. We passed through the narrows and steamed down the Lost Channel. Our hoist of bunting, our white sails snugly furled, the pretty and gaily dressed ladies under the shade of the awnings produced a yachting picture which brought smoke from the guns of the camps and steam from the whistles of passing vessels. Turned the foot of Wells's Island, touched at Alexander Bay for a half hour and then reached the Hub in time for supper. The evening was a grand one on the old St. Lawrence—full moon and perfectly calm.

AUG. 20.—At 9 o'clock a number of our friends came on board, and in tow of the Van Horne, we reached Clayton in a few minutes. A rain set in and for the first time on the cruise our Cape Anns were donned. Made fast at the railroad dock long enough to ice up and hoist our canvas. The wind dead ahead. At 10:30, when opposite Clayton, the wind increased, compelling a single reef all round, and fifteen minutes later a second. The rain ceased, the wind blew strong and puffy W. by S. We were soon down to solid sailing and took the north side of Carleton Island. Arrived at Cape Vincent at 3 P. M. Too much sea for us to undertake to cross Ontario that night. Barometer falling, told us that the morrow would be a continuation of the blow. Took the steamer Maud and visited Carleton Island, where the Salvation Army of Kingston, Ont., were picnicing. The steamer Island Belle ran alongside of the island on her down trip. J. B. D. and the skipper shouted to their friends that they would be up on the first boat in the morning, and steamed back to the Hub.

AUG. 21.—On return to the cape, the skipper found his first mate saying good-bye, an important law suit requiring him to leave at once. A pleasant hotel we found the Rathbun; its guests were mostly New Yorkers.

AUG. 22.—Early in the morning we made sail and beat out into the rough waters of Ontario, where we found the wind S. W. Lunched on deck as we cleared the head of Grenadier Island and stood for the Ducks. The wind was a little more westerly, and knocked us off to Yorkshire. We were making good time and getting the best of a schooner which was making for the False Ducks. At one bell in the afternoon watch, while asleep forward, I was awakened by the yacht's sudden lighting up from sailing on her side. Looking about, I found we were passing through the passage between the Ducks and Yorkshire. The narrow channel, the deep clear water, and the inviting shores almost induced us to come to, but as we were short of time, we slipped along past, and stood on for the south shore. The wind hauled to its customary evening berth from the southward. As the Galloo beacon was lighted, we were about five miles due south, on the starboard tack. Put about soon after and stood to the westward. A faint coloring on the horizon now and then told us that a storm was coming our way. The breeze freshened, the moon threw a light which enabled us to see to set gafftopsail and soon after jibtopsail, as we saw it was to be a race for the north shore. Every point was strained to work out from under the clouds as we flew along S. W. by S. The lightning danced into and out of the water, but not a halyard was slacked. We awaited a peal of thunder before preparations were to commence for a squall. The scene was grand and appalling, the lake smooth, and to the eastward sparkling in the moonlight. The westward was shrouded in inky darkness, except as flash upon flash, with scarce a second intervening, darted in every direction. It seemed as though the engines of the Nautilus (Jules Verne) were at work. The water showed no ripple from the breeze which was sending us along seven or eight knots. There was no sleep in the hour as they passed by. Galloo light was dropped, and once, in a quick glance between the flashes of lightning, we thought we caught Oswego light. When about twelve miles from the American shore we suddenly ran into a close and stifling atmosphere. The breeze died without a last breath, and that deadness in the atmosphere which preludes a coming burst, caused rattling of sheaves and double gaskets around canvas. Everything was made snug; not a square inch of cloth was shown to the elements save the head of the staysail to pay her off before it. Oilskins were tightly buttoned, pipes filled, and we stood ready and eager for the fray. The roar of the water told us it was close. With a distinct sound like escaping steam, it passed to the northward of us and swept toward the St. Lawrence. The suction caused the wind to languidly follow. All sail was spread once more and at 6 A. M., Aug. 23, we swung to our own buoy opposite the club house, having spent sixteen days on the cruise and viewing the country around the shores of Lake Ontario and down the St. Lawrence River. Air line about 500 miles. Our crew separated, after the photographic man had taken an impression of our weatherbeaten countenances, with many regrets, and so terminated a successful cruise that will live in memory long after our yachting days are over. K. G.

NUMBER THIRTEEN.—The thirteenth cutter building this season has been turned out by Wallin & Gorman for Dr. E. G. Loring of this city. The model was furnished by Keating, of Marblehead, and is an improved Carmita, being somewhat narrower and deeper. The builders have made a splendid job all through, and we expect many similar boats will be the consequence. She is what we would call a "sensible boat" in her elements, being safe, roomy and smart, fit for any kind of work. We will soon publish complete plans and specifications. This cutter is 25ft. 10in. over all, 20ft. 10in. water line. 7ft. 9in. beam, draft 4ft., least freeboard 20in. Ballast on keel 1,500lbs., ballast cast to fit floors inside 2,000lbs. Rigged as a cutter, sails of 10oz. double bighted duck. Two shrouds a side and housing topmast. Mainsail 18ft. 6in. on foot, 14ft. luff, 12ft. head and 25ft. 6in. leech. Mast steps 8ft. 6in. from stem, large foresail 18ft. luff, 11ft. foot, 18ft. leech, lugging 8ft. about the mast. Large jib 22ft. 6in. luff, 12ft. foot, 16ft. leech. Bowsprit 10ft. outboard, mast 19ft., sheet to hounds, topmast 10ft. above cap. Cabin 8ft. long, with 4ft. 8in. headroom under a 12in. house, cockpit 6x3ft. Steers with tiller; plumb stem and bowsprit parallel to water line.

QUAKER CITY Y. C.—*Editor Forest and Stream:* The following officers were elected for the year 1884, at the annual meeting of the Quaker City Y. C., of Philadelphia, held Wednesday evening, Feb. 13, at the club house, foot of Market street, Camden, N. J.: Commodore, William H. Vallette; Vice-Commodore, J. Aimer Dittrich; Rear-Commodore, John Hanigan; President, William J. Thorman; Treasurer, Samuel P. Wright; Secretary, Samuel B. S. Barth; Assistant Secretary, William S. Hoffman; Measurer, Rufus G. Wilkins; Board of Trustees—Samuel A. Wood, David C. Walker, A. F. Bancroft, Charles W. Lyon. Regatta Committee—A. F. Bancroft, Lawrence Coleman, David C. Walker, Benjamin F. Murphy, Charles W. Lyon. The thirty-three yachts, comprising the fleet, are classified as follows: First class, cabin sloops over 38ft. Second class, cabin sloops between 32ft. and 38ft. Third class, cabin sloops between 27ft. and 32ft. Fourth class, open yachts between 24ft. and 27ft. Fifth class, open yachts between 20ft. and 24ft. All measurements are on the waterline.—MARLIN.

BUILDING IN BOSTON.—Wood Bros., of East Boston, have finished two steam launches for high speed—one 50ft., the other 55ft. long—for Boston owners. Steam launching is becoming popular in the East, and is being pursued on the English plan by gentlemen living along the coast during the summer months. Same builders have also completed a yacht on the Caprice's lines for a New York owner. She has, however, more weight on the keel—1,228 pounds in all. Keel, stem and post of oak, hackmatack knees, and oak floors for frame, planked with 1in. cedar; deck of bright white pine; cockpit and companion in mahogany. Steers with a wheel. The cuddy forward is 6ft. long with a berth on each side, and air tanks under cockpit to prevent sinking. The lines of the Caprice were published in our issue for Oct. 4. This new boat will be quite a revelation to New Yorkers, and ought to squander local craft in a blow and in light airs.

FOOLISH COURSE.—When the *Herald* questions the truth of a scrub trial last fall, of which there were many witnesses, it is simply allowing itself to be used as a catspaw to persons interested in covering up the facts. We will take care that the truth is not obscured by the one-sided "inspired" denials of the *Herald*. It is a matter of common report that Aneto thrashed the Gleam out of Larchmont harbor in an impromptu trial on a breezy day last fall. If this be denied over any responsible name, witnesses enough will be forth coming. The *Herald* should not permit the wool to be pulled over its eyes in such fashion.

NEW YARD.—Henry Piepgrasshas added to his yard a complete plant for building iron and steel vessels. This includes a 25 H. P. engine and boiler, planers, sheers, punches, and bending furnaces for sheets and angles, all under good shedding. Work on some new contracts is likely soon to begin. He has been getting out complete lots of iron fittings for new yachts in his blacksmith shop from the best brands of iron, all worked up under personal supervision, so that he will be prepared for anything that may come along. Figures have been given for a number of large cutters, but so far no papers have been signed.

EARLY SPRING.—Don't wait till spring is upon us and then wish you had fitted out sooner. Now is the time to overhaul. All live New York yachtsmen ought to fly colors by April 1 for an early turn outside, and perhaps a spring "dash" to the warmer latitudes of Hampton Roads and the Chesapeake. Who will make his number first off the Hygeia?

ATLANTIC Y. C.—Makes a good showing this year with 199 members and 92 yachts, thus putting the club third on the list among New York organizations. Annual match set for June 10. Second and third prizes are to be offered.

NEW DESIGNS.—Mr. G. L. Watson, of Glasgow, has furnished a design for a 20-ton racing cutter to Senator McPherson, of New Jersey, and a 7-ton cutter for others of this city.

NAMOUNA.—This steamer, now flagship of the N. Y. Y. C., is receiving new decks at Day, Summers & Co., Southampton.

GITANA.—Mr. Weld's schooner arrived off Gibraltar Jan. 19, eight days from Madeira, and sailed Jan. 24 for Malaga.

OUTSIDE WEIGHT.—Dr. Henry Griswold will put about 1,000lbs. outside ballast on his little 20ft. sloop this spring.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

H., Pittsburgh, Pa.—Turk is by Rajah and out of Brenda.

A. H. P., Wilkesbarre, Pa.—For cricket goods apply to Peck & Snyder, Nassau street, New York.

MERGUS, East Wareham, Mass.—The bird you describe was undoubtedly a pine grosbeak (*Pinicola enucleator*). See answer to H. L. P.

E. E. A.—Send your name to Dr. C. A. Neidé, Secretary A. C. A., Schuylerville, N. Y., with $1 initiation fee and $1 for dues for this year, 1884.

J. R. H., Watsontown, Pa.—Red Rival was by imported Ranger (Barton's Larry—Lill II.) and out of Rose (Rufus—Duchess) Duchess was a Gordon.

READER.—The French yachting journal *Le Yacht* is published weekly at 50 Saint Lazare, Paris, $5 post-paid. Send post-office order or get through International News Co., Beekman street, New York.

S. B., Circleville, O.—For worm and fly-fishing get Scott's "Fishing in American Waters;" price $3. We can furnish it. For answer to other question see Kennel department. For instructions in canoe building read the series of papers which we are now publishing in our canoe columns.

J. F. D., Seville, O.—The *Tribune* account of the bear and cub was a canard, and was wholly without foundation in fact. We cannot say from personal knowledge that the half-grown cub remains with the mother bear through the winter. The books say that it is left to look out for itself at the age of six months or thereabouts.

W. L. C., Boston, Mass.—The ferret muzzle was described on page 292 of Volume XVII. The directions there given are: "Take a piece of coarse waxed-end, about two feet long. Pass it through the mouth directly back of the fangs. Pass it down under the lower jaw, and tie with a close knot. Now carry it back up through the mouth and across; then up over the upper jaw in form of figure 8, and tie firmly. Carry the two ends up the forehead back of the ears and tie again. Next carry the ends down the two sides of the neck and tie again firmly. The muzzle is now complete. There is no cumbersome weight to carry, nor any pain; and when the animal is let loose, if he has been kept properly, he will go to work with a rim. When the hunt is over remove the muzzle with a knife."

W. O. A.—As near as we know, the sustained speed with normal pressure of steam yacht Yosemite is 12½ knots. Namouna 13½ knots, Atalanta and Stranger 12 to 12¾, Rhada 13. On a spurt they may have done 1 to 1½ knots more. Higher speeds are doubtful and due to tide and wind. For land miles multiply by 6,000 and divide by 5,280. The Herreshoff launch No. 100 was capable of steaming faster than any of the foregoing yachts. Probably 16 knots on a spurt and 14 for a long pull.

H. L. P., Stockbridge, Mass.—A small flock of birds (a sample I send by mail with this letter) appears in our village almost every winter. There appear to be various opinions of the kind. The male birds are beautiful, marked with crimson neck or dark red color. Will you inform me of their species? Ans. The bird is the pine grosbeak (*Pinicola enucleator*), a northern species which occurs pretty regularly in New England in severe winter weather. For very full accounts of this bird, see FOREST AND STREAM Vol. XIX., pp. 264, 284, 323, and elsewhere.

INFORMATION WANTED.

BRASSEUR LAKE, Me.—A correspondent wishes to know about the fishing and hotel accommodations at Brasseur Lake, in Maine.

J. M., Philadelphia, wishes to know of game locality in Georgia or Tennessee where he can settle, raise fruit and shoot game.

Canoeing.

FIXTURES.

Winter Camp-fire.—Wednesday, March 13, 8 P. M., No. 23 East Fourteenth street, Room 16.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

ST. LAWLENCE CANOE CLUB.

CANTON, St. Lawrence County, N. Y.—Organized December, 1883. Commodore, J. H. Rushton; Vice Commodore, M. D. Packard; Secretary and Treasurer, L. P. Hale; Measurer, J. W. Rushton. Eleven active members.

LARGE OR SMALL CANOES.

Editor Forest and Stream:

I have been reading Mr. Neilson's letter on "Large vs. Small Canoes," and partial reply to mine. I am glad to hear the opinions of different canoeists regarding their particular craft, and as I believe Mr. Neilson has had a good deal of experience and hails from a city where large canoes are in vogue, he is as fit as any to speak of their merits.

Now, in my last letter, you pitched into me roundly. I am glad of it, and hope all who wish to will do the same, for, perhaps, a discussion will bring out the respective merits of the different types, and will throw some light upon the methods conformed to by men who use different craft. I think both you and Mr. N. misjudged my letter. Perhaps some of it might be obviated by a more careful reading. You say that "the fears of our correspondent that racing machines will displace the craft now in use are entirely groundless." I have no fears that they will displace the craft now in use. I said I thought they would hurt canoeing, and I do, for many men who used to have small canoes and cruise in them seem now to pay more attention to beating their neighbors, and many points which were quite important to general cruising were given over because they were detrimental to high speed.

Now, by general cruising I mean cruising on rivers, lakes and rapids as well as on the open ocean and bays, and where one may be so placed that he will have to ride out a heavy sea or, perhaps, a storm; and, again, where he may find some insurmountable obstacle around which he will have to carry his canoe alone; such things often happen in real general cruising. Again you say, "there is hardly any limit to what can be done in a 27in. canoe, but that it is safe and dry in rough water, or suitable for coast work is yet to be proven." I have proven it perfectly satisfactorily to myself, and I have tried to be as broad and unbigoted in my canoeing opinions as possible.

You also say that the small canoes were not intended for open water; perhaps they were not originally, but I had mine built mainly for that kind of cruising, and it has risen in my estimation above my most sanguine expectations. I cannot compare it with the Princess and Pearls as a rough water boat, for I have never seen either of those types at sea. Perhaps they are faster under sail, so is a large yacht faster than a small one. Mr. Neilson says I mentioned the Stella Maris as a compromise type; I did not mean to, I said that I believed in a compromise type, and then cited what I had done in my little Stella Maris, only 27in. beam, meaning that it was under the compromise, which I think is about 14x30.

Mr. N. also says that I am unfortunate in my reference to the cruise of the Maria Theresa, as Mr. Bishop used oars most of the time. I do not exactly understand what he means by that, for I never said anything about paddling; and in regard to those long cruises, I said most of our long cruises had been made in smaller boats, and cited that of the Maria Theresa. I have also read both of Mr. Bishop's books, though some time ago, and know perfectly well why he made his change. Mr. N. says he can get his canoe in and out of the boat house alone. But getting a canoe in and out of a boat house is a very different thing from hauling on a rocky shore. I should like to ask Mr. N. if he has done much cruising in the Boreas on tide water, and if he knows how hard it is to land a canoe on seaweed-covered rocks at low tide, with a heavy sea running? In cruising anywhere from Labrador to Cape Cod, one is liable to have to land in bad places, or else lay to over night in perhaps a heavy fog or storm. I have come nearer getting drowned that way than any other, when it would have taken but a little more weight to have pulled me off as my boat slid back on the receding wave.

I say these things as Mr. Neilson did, at the risk of being thought egotistical, but, nevertheless, shall put them as they are. Now in my last letter some may have thought me sarcastical in regard to my questions concerning rigging, but they were asked in all sincerity, with the pure object of being enlightened. I never have used a lug so I cannot tell much about it. I did not write to defend the lateen, but the small canoe. I am perfectly willing to show the faults in my canoe and rig as well as the merits, the only fault I can find with the boat is its low vertical coaming, over which every swash will break. The faults in the sails are more, the worst one is that the mainsail cannot be lowered when running free, yet they are so simple and handy to stow that I cannot help liking them: I think I shall take Mr. N.'s advice and have a lug mainsail made of about 45 or 50ft. area.

The plans of all I have seen have seemed to be rather complicated, but that of the Boreas seems quite simple by description.

I shall try to be at the meet next summer, but I don't think his proposition is exactly fair for I am quite sure I can beat him with the conditions reversed, and any boat with a heavy wind and sea under sail ought to beat one under paddle going to windward and returning. However, I thank him for the invitation. WIDGEON.

[Many canoeists who have used them differ from "Widgeon" in his assertion that a canoe of 27in. with the proportion usually given them, are either dry, safe or comfortable in rough water, added to which, they will not carry the weight of stores, etc., needed in open-water cruises. That many long cruises have been made in small

canoes is due to the fact that all of the early canoes, from the published descriptions of which the first canoes in this country were built, were of 26 to 27in. beam. Since the introduction of the 14x30 canoes, they have largely displaced the smaller ones for cruising, as is shown by Dr. Neidé's Aurora, 15x31, Captain Kendall's Solid Comfort, 16x36, Mr. Gardner's canoe, 14x31, Mr. Eckman's, 14x30, all of which have lately been down the Mississippi, and many other cruising boats. The idea that one boat can do well all varieties of work has been long since rejected by canoeists, and it is admitted that several varieties are desirable, broadly speaking, a 14x27 canoe for river work, a 14x30 for general cruising, and the Pearl type for open waters. If "Widgeon" will describe a boat that can paddle easily against a head wind and heavy sea, can be portaged or carried on the back by a man of ordinary strength, and will go to windward under sail in a heavy sea, he will solve the question that has so long vexed canoeists. The assertion that "many points which were quite important to general cruising were given over because they were detrimental to speed" is very indefinite. Will "Widgeon" mention some of those which have been sacrificed in the leading boats of the last three seasons?]

AMATEUR CANOE BUILDING.

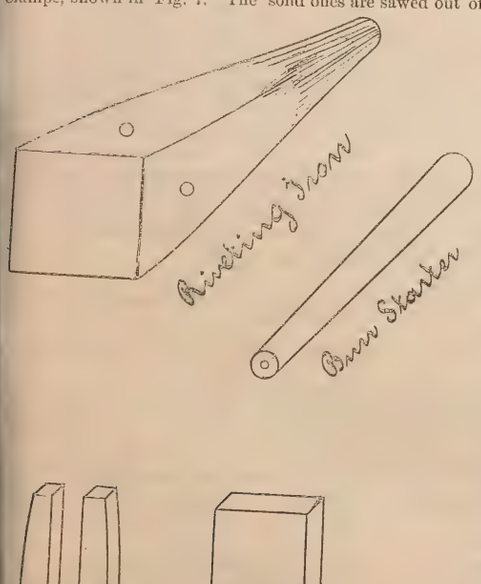
Seventh Paper.

TOOLS AND APPARATUS.

THE excellence of amateur work depends not, as many imagine, on the number of tools at hand, but on the care and perseverance devoted to it. The best work may be done with very few tools; but, on the other side, it can be done much more quickly with a larger number.

If the amateur desires to build but one boat, at as small an outlay for tools as possible, he will find the following sufficient:

Panel saw, 16in., 8 teeth to the inch	$1 00
Rip saw, 28in., 5 teeth to the inch	2 00
Compass saw, 12in	40
Jack plane, double iron	1 00
Smoothing plane, double iron	85
Thumb plane	25
Claw hammer	75
Riveting hammer	40
Cutting pliers, Stubbs's or Hall's	85c. to 1 25
Small screwdriver	50
Three gimlets, 1-16, ⅛, ¼in	50
Three brad awls	25
Six-inch try-square	35
Spokeshave	50
Marking gauge	10
Chisels, ⅛, ½, 1in	75
Two foot rule	25
Gauges, ⅛–1in., inside bevel	50
Oilstone	1 00
Compasses, 5in	40
Four iron clamps, 4in	2 00
Chalk line and scratch awl	25
	$15 25



The above are about the prices of the best quality tools, cheap ones not being worth buying, and with them any kind of small boat can be built, but the addition of the following tools will save some time and trouble:

Eight-inch ratchet brace	$1 85
Center and German bits, various sizes	1 50
Countersink	25
Rabbet plane	65
Bead plane, one-quarter inch	50
Draw knife, nine-inch wide blade	1 50
Screwdriver, ten-inch	65
Twenty-six-inch hand saw (Instead of sixteen-inch panel saw)	1 75
Eight-inch back saw (Instead of sixteen-inch panel saw)	1 10

These will be all that are needed, except a few files, and two or three drills to fit the brace, for the brasswork, such as the stemband, but there are some others that are very useful, though by no means indispensable, as follows:

Two-foot steel square.
Bench axe.
Expansion bit, seven-eighths to three-inch.
Level.
Convex spokeshave, for oars and paddles.
Mortise gauge.
Adze, for larger boats.
Small hand-drill stock with drills.
Two or three round sole planes for spars.

Besides these tools there will be needed a small block of iron called a "set," used to hold against the head of a nail in riveting, a "burr starter," which is a piece of iron or brass rod ⅜in. in diameter and 3in. long, with a small hole in one end, used to drive the burrs on to the nails, and some wooden clamps, shown in Fig. 7. The solid ones are sawed out of

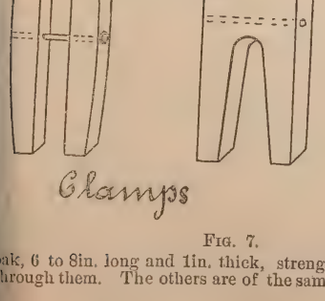


FIG. 7.

oak, 6 to 8in. long and 1in. thick, strengthened by a rivet through them. The others are of the same size, but in two pieces, joined by a bolt or rivet. In use a wedge is driven in the back, closing the other ends of the jaws.

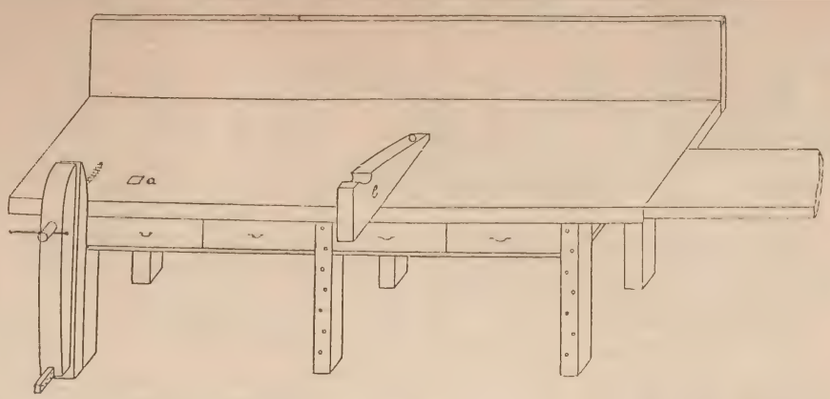

FIG. 8.

FIG. 9.

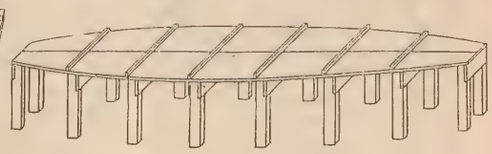

FIG. 10.

A work bench of some kind must be had, the simplest form being a plank 2in. thick, 10in. wide, and, if possible, several feet longer than the intended boat, so as to allow room for a vise on one end, as well as space to plane up long boards. This plank should be securely fastened along a wall, 2ft. 8in. above the floor and with its outer edge 20in. from the wall, the space at the back being filled in with 1in. boards, making a bench 20in. wide, the top being level and smooth, as the material to be planed on it will be very thin. A vise of some kind must be placed near the left hand end, an iron one being the best, but the common wooden one will answer, and is much cheaper.

Fig. 8 shows a permanent bench fastened to the wall. The top is 3in. thick, of oak, and should be 24in. wide, and at least 10ft. long, a piece of 2in. plank being fastened at the right hand end by way of an extension for planing long stuff. A series of ¾in. holes about 3in. apart are bored in each leg, a peg being inserted in one of them to support long boards, in planing the edges. A bench hook (*a*) is placed near the vise; the bracket (*b*) is cut out of 2in. stuff and is bolted to the bench, being used to support spars, paddles and similar pieces, one end being held in the vise, and the other resting on the bracket.

Drawers are provided under the bench for tools, nails, screws, etc. At the back of the bench an upright board 12in. wide, carries a rack for the chisels, gouges, gimlets and small tools, above it, on the wall, the saws, draw-knife, spokeshave, brace, etc., are hung, a rack for the small planes, and another for sandpaper is fastened, also small boxes for such nails and screws as are most frequently required.

Two saw horses or benches are also necessary, the tops being 3in. thick, 6in. wide and 3ft. long, and the legs 2ft. long. Two pins of hard wood 1in. in diameter are driven tightly into holes about 1½in. apart in one of the benches. When not in use they are driven down flush with the top, but in slitting long boards, they are driven up and the board wedged between them.

Another useful piece of furniture is a stool about 1ft. x 18in. on top and 18in. high, one-half of the top being a seat and the other half, the right hand side, making a tray to hold nails, screws, hammer, pliers, and other small tools used in fastening the plank, thus avoiding the necessity of stooping over the work, and also keeping the tools off the floor.

A framework of some description is always necessary to support the boat or vessel in building. If a ship or yacht, the keel is laid on blocks a short distance apart, but in boat work, the "stocks," as they are called, are usually a plank set on edge, at such a height above the floor as will bring the boat in a convenient position (Fig. 9). The piece (*a*) is a common pine or spruce board, 1in. thick, 8 or 10in. wide and 13ft. long, the upper edge being cut to the rocker of the keel, as taken from the drawing. This board is supported on three legs and securely braced in all directions, the top being 20in. from the floor, so as to give room to work on the garboards.

Another style of stocks is shown in Fig. 10, a table being built about 13ft. long and 30in. wide, somewhat like a canoe in breadth; the top, which is 20in. from the floor, is perfectly level. A line is drawn down the center, while across the board, battens, 1in. wide and 1½in. deep, are nailed, 2ft. apart, to each of which a mould is screwed, the boat, of course, being built keel upward.

This method of building (similar to that employed for shell boats) is the easiest and best, but involves more labor in the construction of the table or stocks; however, if several boats are to be built, it will pay to make a strong level table, as when once a set of moulds are made and each fitted to the screw-holes in its respective crosspiece, they may be set in place in a few minutes with every certainty that they are correctly placed, and that they must remain so, while the table makes a convenient place to lay tools.

Finally a steam box of some kind is necessary, its size depending on the work to be done. Usually all the steaming required for a canoe is the timbers, perhaps ⅜ or 7/16in. thick, which may be done with care in a trough of boiling water, but if anything larger is to be bent, a kettle, holding a couple of pails of water, should be arranged over a stove, or roughly bricked in if out of doors, a top of 2in. plank being fitted closely to it with a pipe leading from the top to the steam-box, which is of 1½ or even 1in. boards, and may be 3x6in. inside and 7ft. long, supported on trestles or legs near the kettle, and fitted on one end with a hinged door to close tightly, or the end may be closed with a bundle of rags.

AMSTERDAM C. C.—*Editor Forest and Stream:* The ice has gone out of the Mohawk River, and a view of open water once more has revived the Amsterdam C. C., and they wish to claim a club flag. A pointed burgee, 10×15in., white ground with a blue maltese cross. The club trusts to have their members at the Newburgh meet.—C. H. WARRING (Canoe La Polka).

THE LOG BOOK.

V.—DOWN THE MISSISSIPPI.

[*Continued from page 56.*]

ABOUT 10 o'clock the fog disappeared, and we started out to see what the chances were for getting off, and finding the chute about 200yds. wide, with quite a current, and no skiff in sight, we concluded that it was "raft" or swim. We didn't exactly like the idea of swimming in that cold water and carrying our clothes besides, so after calling to some negroes who happened to come along on the bank, and learning from them that there were no skiffs on that side of the river nearer than two and a half miles, we decided that we needed a raft in our business, and started about making it.

There were quite a number of trees and saplings which had been left on the bar in high water, and we picked out a log about 1ft. in diameter and 20ft. long, and two willow saplings 9in. in diameter, besides some smaller stuff for braces, and carried them down to the water. The big log was partially rotten, but it had to go. We put the big log in the middle, the willow saplings on either side, and the smaller saplings inside of them, and bound them all together with willow poles spiked down laterally and obliquely. She worked first rate, being quite buoyant; but you had to straddle the whole business, and throw all your weight on the two large saplings, for if you stepped on the rotton log it would let you through into the drink, as we didn't have nails enough to make it fast.

I mounted the old craft and started her off, and after a few minutes' paddling lafided her on the opposite side of the river. It was a great satisfaction to be able to get to "dry land" once more, and I stepped out for the nearest landing on the "double quick." We had spent nearly all our money at Vicksburg, but had a sufficient amount of provisions to last us to Baton Rouge, where a supply of funds awaited us. I had therefore to make a bargain with the negroes whereby we were to pay them in camp truck for taking us and our tent, etc., down the river to Ellis's Cliff, about five miles from our bar.

They borrowed a skiff from the storekeeper, and we started for the bar, which was soon reached, and after loading our goods we set out for the "Cliffs," landing at nightfall. On the way down we were very much amused by the talk and actions of the two specimens of "nigger" which constituted the crew. Their rowing in particular was most ludicrous, and reminded me very forcibly of the little mechanical rowers which we see in the toy shops. We camped at the landing that night, and the next day learned that the steamer Ed. Richardson would be along about 2 A. M. Sunday.

In the afternoon we learned that our boat had been picked up about ten miles down the river, and carried back into the country about one-fourth of a mile, so B. started out to walk down and look for it. As he could not get back in time to catch the steamer I got all our things together and put them in shape for shipping, and bunked that night in the hut of an old negro fisherman, and got aboard the steamer all right. Being absolutely "dead broke" I had to make arrangements for our transportation to New Orleans, "standing them off" until we could reach our funds. B. came aboard when we reached his landing, and reported "no boat," so I guess that she's "up a hollow stump."

We had a very pleasant time on board the Ed. Richardson, and I must confess that it was very agreeable to think that one was not dependent upon his own exertions for either meals or lodging. Captain Campbell, who, by the way, commanded the R. E. Lee in her famous race with the Natchez, took a great deal of interest in our cruise, and expressed himself as being very sorry that we had been unable to finish it; but whenever I sat down to the table and filled up with a square meal, stowing away such quantities of grub that the waiters seemed to wonder where it went to, I wasn't so very sorry, you know, as I wanted folks to think. We reached New Orleans Monday afternoon at 1:30, having had to lay up Sunday morning from the time I got on until about 9 o'clock, and all Sunday night on account of dense fog. From about Baton Rouge to New Orleans, 130 miles, the whole river is navigable, and steamers can make a landing anywhere. The canoeist will therefore be compelled to take the bank for his camping ground, and trust to luck for dry wood.

The country along here presents the appearance of one large village, as it is built up the whole distance to New Orleans, the houses being at no time perhaps more than a quarter of a mile apart, and most of the time about 100 yards. It is called the Sugar Coast, and is quite a surprise to any one coming from the upper river, as we did. We stayed in New Orleans a week, taking in most of the town, and arrived in Chicago Dec. 2, just eleven weeks from the day of starting on the cruise. I had intended to come back by steamer to St. Louis, reviewing the old scenes, but my brother was ill, and the family telegraphed me to return at once, so I was unable to carry out my intentions. At Cairo, however, I saw that the point where we had camped had eight feet of water on it, and the old scow was gone, as was also our ancient friend.

From my experience on this trip I don't think that I want to take as long a one again under similar circumstances. A cruise of a month or six weeks is as long as the thing continues to be thoroughly enjoyable, especially when you have camp to pitch, grub to cook, etc. Above all, a person wants company. Two persons in one boat cease very soon to be entertaining to each other, and such a cruise should be made by at least three, and they ought each to have a boat. Even two persons in separate canoes could have a good time, as the races which they could have would enliven proceedings and chase away the "blues"; but no more "one boat for two" for me. There was an article in the *Canoeist* last spring to the same effect, and that article recurred to my mind several times on our cruise. J. W. KEOGH.

CANOE OR SNEAKBOX.

Editor Forest and Stream:

In reply to "A. H. A.'s" question as to whether he should procure a "canoe or sneakbox," I would say, let him get a canoe first, and then, if he is not satisfied with it he can readily exchange it for the heavy, unwieldy, hard-rowing and slow to windward sneakbox.

As to the durability of the canoe, both as to hard knocks and as a sleeping apartment, let me say that, on my recent cruise from Lake George, N. Y., to Pensacola, Fla., I believe my canoe had the roughest kind of usage. Heavily laden, she was portaged for 70 miles by rail, and many more in a springless wagon over rough roads; was jumped over dams, tracked over the stony bed of the Alleghany River, banged against snags on the Mississippi, and dashed on the hard sand beaches of the Gulf of Mexico by the powerful force of the surf.

I used her as a sleeping apartment for more than five months, simply pulling her out on the shore, using a little care to see that she rested on an even keel, blocked her bilges with a stick or two of drift wood and with her forward and after compartments filled with stores and duffel, her decks loaded with the contents of the cockpit, I stretched myself at full length and took the usual "roll over" during

the night. Yet this canoe, Rushton-built, Princess model, 15ft. by 31 inches, built of white and red cedar, never leaked a drop during the entire voyage of nearly 4,000 miles, except through a small hole, which had been punched through the centerboard case by a too strong yank on the lever in raising the board.

As to whether she "warped and got out of shape," may be judged from the fact that, a couple of weeks ago, she was stripped of her deck in order to make some changes in it, and to put in a new plank which had been split when she was thrown on a rock in Lake Champlain last September.

Critically measured, she was found to have retained her original shape, notwithstanding the fact that contact with rocks had pulled many nails out of her bilges when running rapids. I do not write this to "blow the horn of the builder," but to give "A. H. A." a little practical information. CHAS. A. NEIDÉ (Canoe Aurora)

PITTSBURGH C. C.—*Editor Forest and Stream:* I have to report that at the annual meeting of the Pittsburgh C. C., held Febr ary 11, officers were elected as follows: Captain, Mr. Geo. Harton Singer; Lieutenant, Mr. George A. Howe, and Purser, Mr. Reade W. Bailey. The duties of the lieutenant were made to include the providing of transportation and supplies when on cruises (it is the practice of our club to take an annual cruise in a body). The club burgee was changed to the following: A pointed burgee, 12×18in., blue ground gold border, 1in. wide all around, and an oak leaf in gold in center. The club is in a prosperous condition and expects to receive several new members and canoes before the opening of the season. The undersigned was out on the flood in the Monongahela on the 6th, being, I believe, the first canoe of this club in the water this year, and paddled through some novel places for any water craft.—KATRINA.

POT LUCK FROM EXCHANGES.

A picture by one of the old Chinese masters, now on exhibition at Tokio, establishes the fact that reels were used by Chinese anglers more than 800 years ago.

An honest old Pennsylvania farmer had a tree on his premises he wanted cut down, but being weak in his back, and having a dull ax, he hit upon the following plan. Knowing the passion among his neighbors for 'coon hunting, he made a 'coon's foot out of a potato, and proceeded to imprint numerous tracks in the snow to and up the tree. When all ready he informed his neighbors that the tree must be filled with 'coons, pointing to the external evidence made with his 'coon's foot. The bait took, and in a short time half a dozen fellows with sharp axes, were chopping at the base of the tree, each taking their regular turn. The party also brought dogs and shotguns, and were in ecstacies over the anticipated haul of fat 'coons. The tree finally fell, but nary 'coon was seen to "drap."—*Germantown Telegraph.*

A Missouri farmer found that a flock of wild turkeys were in the habit of visiting his corn, stored in an old building in a field. So he fixed a long string to the door and left it open. Stationing himself in a hidden position some distance away, he waited patiently for the evening call. Soon they came along and entered the house; the door was pulled shut, and thirteen fine turkeys rewarded his vigil.

Several proprietors are anxious to introduce grouse into the Shetland Islands, and are devising means to render such a step practicable. The chief barrier in the way is the enormous number of ravens and such birds, and until something has been done to check their growth it will be useless to attempt to make Shetland a field for sport. The engagement of a number of trappers to help to kill off the existing scourges is proposed.

SECTION BAMBOO RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be *incomparably superior*. While no hexagonal or any angular) rod can be perfect, we long believed that with proper work anship and material a *really good* angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

ABBEY & IMBRIE,

Manufacturers of every description of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, NEW YORK.

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

Established 20 years. Open Evenings. **J. F. MARSTERS, 55 Court St., Brooklyn.**

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

WARNING!

Buy or use no Clay Pigeons or Clay Pigeon Traps excepting those made or licensed by

The Ligowsky Clay Pigeon Co., Cincinnati, O.

This company owns the original patents on "Clay Pigeons" and "Clay Pigeon" Traps. Others are manufacturing in infringement of these patents; and all who use or sell such infringing Clay Pigeons or Clay Pigeon Traps will be prosecuted. The Ligowsky Clay Pigeon Co. furnishes traps at $7.00, with all the latest improvements and guaranteed against any liability for infringement.

Send for circulars of the 5-days programme of the First International Clay Pigeon Tournament, Chicago, May 26 to 31. Over $5,000 in prizes and sweepstakes.

ANSWERS TO CORRESPONDENTS.

FOOD FOR QUAIL IN CONFINEMENT.

AT this time of the year, when many of our readers are, no doubt, purchasing live quail for turning out in spring, the question of their treatment comes up. Usually the most important point to be considered is that of their food. Often the poor little things have made a long journey without eating or drinking, and when they reach their destination are in a deplorable condition of starvation and weakness. At such a time they should not be too liberally fed, and only enough grain should be given them to take the edge off their appetite.

The best food for quail in confinement of which we have any knowledge is what is commonly known at the feed stores as "screenings." This consists of the light weight grains of wheat or rye with other smaller grains, and the seeds of the plants which may have grown in the field with the crop. The chief recommendation of this food is that there is a great deal of variety to it, and that it is composed of the seeds which the quail eat in a state of nature. A diet wholly of wheat or cracked corn, even though the birds may for a time appear to thrive upon it, is not so good for them as one in which there is more change. A man would soon cease to enjoy his meals if they always consisted of beef or mutton, and in like manner the quail need change of diet. An essential to the well-being of these or any other gallinaceous or grain-feeding birds is plenty of gravel with which to triturate what they eat. Unless they have this, the food is very imperfectly digested, the birds ill-nourished and unable to withstand the diseases which are sure to follow the failure to assimilate what passes into the gizzard. It is not enough to supply them with earth. This is good for them in one way, for they will roll and bathe in it, and it keeps them free from the attack of insects, but it will not take the place of coarse sand or gravel. This they must have. Common building sand, if a little fine gravel be mingled with it, is very good; but the ordinary white sand of the sea beach, such as is used for scouring, is too fine for the purpose.

As might be supposed, the birds will do best when they have a constant change of food. A few heads of lettuce or some leaves of spinach thrown to them, twice a week during the winter, will do much to keep them in good condition, and to make them well and strong at the time for turning them loose from their prisons in spring. If they are confined in a warm room, a handful of canary seed sowed in some moist earth, and protected until it has had time to sprout and send up shoots an inch high, will be eagerly eaten by them, and the exercise of scratching among the dirt will prove very beneficial.

We have sometimes fed the birds a little finely chopped beef, which they devoured with relish, but this is perhaps pampering them a little too highly.

It is well worth the while of any one who is keeping quails over the winter to devote a little time and thought to the question of his birds' appetites, for on this may turn the whole success or failure of his attempt at stocking his grounds.

REGULAR ARMY RIFLE IMPROVEMENT.

BY General Orders No. 21 from the headquarters of the army, Lieut.-Gen. Sheridan makes known the results of the army rifle practice for the season of 1883. The returns are instructive and encouraging, and with the start already made and the records made it is pretty certain that drill in ball firing has been placed on a substantial basis in the regular army. The progress made may perhaps be more readily appreciated by the comparison of the number of marksmen qualified in each of the recent shooting seasons, during which period there has been little change in the aggregate army roll. In 1880, 122 marksmen were qualified; in 1881, 612; in 1882, 1,737, and in 1883 the number on final classification ran up to 4,834, or nearly 25 per cent. of the total firing force. Of this last number 3,333 are in the infantry arm of the service, 898 in the cavalry, 479 in the artillery, and the remainder in the engineer battalion and on the general staff. In the several departments, Dakota leads with 1,655 of these tested experts; also leads in percentage to the strength of the command, rising to thirty-five in the hundred. The other department returns showed: Missouri 909, Platte 654, East 466, California 304, Texas 285, Columbia 258 and Arizona 221. Among the army posts Fort Sisseton holds the front place with a figure merit reaching 95.70, followed by Fort Bennett with 91.80 and Fort Sill with 91.55.

The figure of merit of the several organizations has been made up, but in many cases the regiments are so scattered among the various forts that the figure of merit suffers through the inability of all the members to take proper range practice. The 24th Infantry ranks No. 1, with a figure of merit of 79.52; the 11th Infantry is second, with 72.40; the 18th Infantry is third, with 61.43; the 3d Infantry next, with 61.04; the 17th Infantry next, with 57.72; the 1st Artillery is sixth on the list with 56.62.

In individual scores the showing is a very fine one, and among the leaders there is a close crowding up to the highest possible. There were nine members in the army who, in the course of the season, made 94 or upward in qualifying for the marksman's badge. Their names and scores are:

Name and Rank.	200 yds.	300 yds.	600 yds.	Av. pr. ct.
1. Private Eskete, A, 3d Art.	94	92	100	95.33
2. Lieut. Partello, B, 5th Inf	96	90	100	95.33
3. Sergt. Dougherty, M, 1st Cav.	96	92	98	95.33
4. 1st Sergt. Hickey, D, 21st Inf	96	96	94	95.33
5. 1st Sergt. Murphy, I, 1st Cav.	94	92	98	94.67
6. Lieut. Brant, K, 1st Inf.	92	92	98	94.00
7. Capt. Blunt, Ord. Dept.	92	94	96	94.00
8. Capt. Carr, I, 1st Cav.	96	90	96	94.00
9. Lieut. Anderson, M, 4th Art.	96	92	94	94.00

RIFLES AS MORTARS.—J. H. Brown, maker of the Brown standard rifle, has been busying himself in the invention of a rear sight which converts the ordinary army rifle into a mortar, so that by its use a shower of bullets may be sent over a hill, wood or other intervening obstruction, directly upon the heads of an advancing foe, or from an outlying position within a fortification where the enemy may be massed. Such a fire, it is well known, is of a most demoralizing sort, and if it can be brought within controllable limits, will be a most valuable mode of attack.

A NATIONAL ASSOCIATION.—It is proposed to form a national trap-shooting association, which shall exercise control over tournaments, adopt shooting rules, provide championship medals, act as a board of arbitration, and in general serve the trap-shooting interests of the country. There is no doubt that such an union would be advantageous.

FOOLISH DOG TALK.

THE anti-dog talk indulged in by some of the agricultural papers, and often by newspapers, in the columns devoted to agriculture, must disgust a majority of readers; for mankind, to its credit be it said, loves dogs and dislikes such abuse of its friends.

The silliness of a deal of this talk is immense. Take for instance this which the New York *Tribune* quotes, with the commendation of being "sensible" from its Chicago namesake. "One important charge made against them [the dogs] would be that they help men, who should be in better business, to kill birds which if permitted to live would keep down the number of insects injurious to food crops. It may be no fault of the dog that he is thus brought into the business of increasing the cost of living, but it certainly is the fault of the industrious and honest workers, who are ever called upon to pay the cost of the necessities and the pleasures of the idle and the vicious." As if trapping and netting were not more destructive of game birds than the legitimate shooting of them over setters and spaniels; and as if all who take pleasure with dog and gun were either idle or vicious or both. The farmer who so recreates himself amid his many days of toil with now and then a happy one in woods and fields will not relish being placed therefor in these classes more than will the hard-worked professional man whose only play spell in all the year is in the few days when he takes the field.

Further on it is said, "observant flock owners * * * declare that the shepherd dog, that embodiment of canine intelligence, is not a profitable investment on the farm even in caring for sheep. * * * An average boy of ten can do all that the shepherd dog can do, and much more." That is, we suppose, he can keep all day on foot, without food from morning till night, herding a large flock of sheep, can bunch them in an open field, drive in all stragglers, catch any sheep pointed out to him, and so on to the last of the things which a well-trained shepherd dog is expected to do, and "much more." Now, if it is true that "an average boy of ten" can perform all these duties, to say nothing of what may be included in the "much more," there are very few people aware of the vast amount of unused valuable material lying idle in the country. But it is not true, as "observant flock owners" know, and this dog-hater knew when he wrote this "sensible talk about the dog nuisance." And besides being untrue, it is sheer nonsense, as is almost all that is written and said by those who are urging a war of extermination against the dog. It is as senseless to demand the killing of all dogs because some dogs are bad or worthless, as it would be to ask that all men should suffer death or imprisonment because many of them are knaves and good-for-nothings.

But we need not be greatly alarmed for the dogs, for though this writer declares that "when the whole subject has been thoroughly sifted, there is to be found in favor of the dogs little more than a misdirected and mawkish sentiment, which leads otherwise sensible people into the filthy habit of fondling flea-bitten and carrion-loving beasts." This "mawkish sentiment" is so deep-rooted and so active, that the time is far in the future when the preachers of the dog crusade will get much of a following.

More truth and sense than is contained in what we have quoted, is the saying of a more appreciative writer, that "the best part of a man is the dog that is in him." Therefore, beware of him who hates dogs.

FISHCULTURE.—A very able article on fishculture is contributed to our columns by Mr. Charles W. Smiley, of the United States Fish Commission. It presents the case of fishculture in the best and fairest light that we have yet seen. The infant industry has suffered from enthusiastic friends who have claimed that an acre of water will produce more than an acre of land, etc., and who have raised hopes of tons of food fish from the planting of a few fry in some stream. They have proved their position by figures, such as can be found in the older fishcultural books, and have not taken into consideration the many other forces operating against the fishculturist. Mr. Smiley has covered the whole ground in an exceedingly short space, and condensed as much information in his article as some men put in a volume.

"WOODCRAFT." This is the title of a book on camping out and kindred topics. The author is "Nessmuk." Who is better fitted to write such a book? It will be published in March, and will bear the imprint of the FOREST AND STREAM publishers. Unless we err greatly, "Woodcraft" will add to the well-deserved fame of its author as a writer on woods themes.

THE WOLF CRY IN MAINE.

THE Maine Fish and Game Commissioners have handsomely checkmated the cry of wolves in that State. Some fifty years ago these animals were numerous and terribly ravenous in the many sparsely settled districts of New England, and the farmers found it impossible to raise sheep, and even calves and pigs were frequently destroyed. Instances were numerous where strong men were attacked and overpowered by the packs of wolves. A war of extermination was waged against them by the farmers and settlers. The State paid a heavy bounty for their destruction, and the wolves have been among the departed for thirty-five years at least.

Curiously enough there are old settlers in Maine who retain the theory that wolves follow deer. They claim that there were no deer at the time of the wolves—"the wolves killed them all off"—but that since the extermination of the wolves the deer have gone on increasing. The poachers and crust hunters have taken up the cry. "Protect the deer and the wolves will follow," they said last winter when further legislation was proposed. Now they have actually started story after story of wolves seen and heard. "They have followed down from the Canadian forests after your protected deer," they say. "Now the poor farmers' sheep will all be killed." This is all very well, to create a sentiment among the farmers in the back towns against the protection of the deer by law. But the cry is the sheerest nonsense in the world, and has not a particle of foundation in fact.

The poachers and crust hunters forget that the deer never were so numerous in Maine as some twenty years ago, when their hides used to be brought into Bangor in hayrack loads —an actual fact, a hayrack on a sled, loaded with deer skins, drove into Bangor—all killed by crusting and driving the poor creatures into their yards, where, confined by the deep snow, the deer could not escape. They forget that the wolves did not follow a plenty of deer then. Indeed the State about that time reduced the bounty, or took it off altogether, because there were no wolves to kill.

But the answer to the wolf cry by the Fish and Game Commissioners of that State is excellent. They have offered an extra bounty of $5 for every wolf scalp, in addition to that which would be allowed by the town in which the creature was killed. They might safely make it $25, for there are no wolves in Maine. A single howl, louder than that of the poachers themselves, would raise an army of hunters who would scour the woods till the wolf was destroyed. It can clearly be established that there is not a shadow of danger to the farmers' sheep from wolves, and if it could be as clearly shown that a few wolves would follow an increase of deer, there would be fun ahead for the boys in hunting them.

The Sportsman Tourist.

IN THE LAND OF THE PHARAOHS.

I AM not about to write an essay upon Egypt, or a description of the old cities of the Land of the Pharaohs, for we want to hear about the shooting, about the game on the shores of old Nile, and those of us who want to learn all about Egypt, will find plenty of descriptions, good, bad and indifferent, in thousands of books, all the way between Mark Twain's and Thackeray's, to the illustrious companions of all travelers, Murray's or Baedeker's handbooks.

Cairo was behind us, the Pyramids had been passed, and three of us had hired one of the dahabeahs or boats, which carry travelers up to the second cataracts. Fancy a long, shallow boat, with two short masts, carrying an enormous triangular sail, with benches in front for the rowers, swarthy fellows, twelve in number, the laziest hard-working men I have ever seen. We were racing against another boat, and the proud Stars and Stripes we were flying at our stern were forging ahead of a Union Jack that was doing its very best to win. Our rowers were working in their peculiar way, which they use when they want to make good time, first crouching forward and bringing well back the blades of their huge oars, then dipping in the water, then a pull, as they rose erect in the boat, and at the end of the stroke they would thump down on their benches, to renew once more that laborious procedure.

The broad river stretched far away before us, the landscape bright and clear, the setting sun streamed golden and crimson rays upon the mid-day water, that sparkled into a broad sheet of fire and diamonds, to reach like a road paved with jewels the horizon where the fiery orb was going down. Away on both sides the shores were to be seen, green reeds and water plants near the edge, stately palms and date trees on the land which was covered with rice fields. A fellah was driving an extraordinary team composed of a forty-inch donkey and an eight-foot camel; a couple of women standing in the water and filling their water jars were looking at us. Far away some indistinct ruins were boldly standing against the horizon. The stately columns that had seen the Pharaohs were still rising, challenging proudly the efforts of old Time to lower their heads. Now, indeed, were we in Egypt, now we felt far away from home, as the light was disappearing from the heavens, soon to make room for the silver crescent of the waning moon, and for the bright stars that glistened from on high. As it was getting dark, we neared shore and made fast for the night, and after discussing our pipes and our Bass's ale we went to sleep, and I, for one, began dreaming about Rhamses the Great, and the great river, the Father of Crocodiles and Hippopotami, and about being arrested for shooting a sacred cat, or led to execution for desiring a steak from the holy old ox, Apis.

I had just finished an extraordinary vision, in which, regardless of chronical accuracy, Amenophis the Third, the ever-truthful, was quaffing Bass's ale with King Cheops, the mighty slayer of nations; in which Sethos the First was playing cards with Herodotus, and in which a band of Hyksos were dancing with a bevy of beautiful Almehs, when I awoke, for the Reïs, or Captain, was thumping at my cabin door, saying: "Yes, yes, breakfast," and a lot of Arab besides, totally incomprehensible; however, I understood that morning rations were to be served out, and soon I was up and doing justice to grub.

We had passed Toora, we had stopped one night at Bedreshayn, from which place we had visited Sakkarah; we had sailed, we had been rowed, we had been towed along from the shore. Shells had been loaded, the guns (dear old companions) had tenderly been nursed and greased; a few pigeons had been killed on shore, the little '73 Winchester had cracked on the river and had succeeded in very thoroughly frightening sundry ducks and sedate old pelicans, but no real game had been shot, and we were never so green as to think we could find crocodiles to order; in fact, they are hardly ever seen below the first cataract. On the way to Benisooef and Minieh, as we were sitting on deck one day, we saw, far off, a dozen or so of old pelicans flying down the river toward us; a scamper in the cabin for the guns! out again! and they near us. When within about sixty yards of us, my old friend Mr. B. blazes away—a miss, though he swears he hit him hard; "—— hard, I tell you, sir," says he. Whang! and my old pin-fire rings and one bird goes down; another shot, but they are too far away. One of the crew took the little boat and made for the bird, but pelican is only winged, and by and by we all laugh to see the man try and catch the big bird, while the pelican turns around and viciously strikes with his long bill. The rest of the crew join in the general laugh, but by dint of striking at the bird with an oar the man gets him at last and brings him back in triumph. Our dragoman informed us that he could show us some good places for sand grouse, and many times the little boat would take us ashore, and the ring of chilled shot once again would whizz through the air and many a pretty shot and a ludicrous miss would remind us of happy hunting grounds near home.

Many fine bags of the plump birds did we bring back to the dahabeah, and our cook would serve us delicate dishes and make us think that life was perhaps better worth living up the old Nile than anywhere else.

Many beautiful birds we shot on our way up—the snow-white paddy birds, a good many ducks, pigeons, abundance of all kinds; and one of our party had been so astonished by having a fox rise at his feet that he forgot he held his old trusty Sure Death, and let him go unharmed.

By this time we reached Golosaneh, where we were visited by a holy Sheykh, who blessed the whole boat and all that therein was—for a very moderate consideration.

When arrived at Minieh we put in a lot of new provisions, at least the dragoman did, and we went about, and after we had seen all the squalor, and dirt, and misery, and disease that was good for us, we went on board again, and pretty soon we were on our way once more, bound for Siout.

On the way our Reïs, who had watched with great interest whenever the Winchester was fired, and who had admired the way in which the little .44 bullet skipped on the water, hundreds and hundreds of yards away, but who had seemed to despise the way in which the ducks I fired at never seemed to mind it much, was made more respectful by a little fancy shooting of a very mild description. Hitting tin cans on the wing (tin cans grow in all countries, dear readers) I frequently managed to do, and when, after a little more practice, I managed generally to break beer bottles previously thrown overboard and fifty or sixty yards off, his fancy was visibly tickled, and the writer, proud of having somebody to admire his prowess, bestowed upon him a present of good tobacco. It is a pity, however, that this story of sport should degenerate into tin-can shooting, so let us on with our journey.

Our boat was forging ahead, poling and rowing, and sailing and being tugged, and shooting was to be had to our hearts's content. One morning a good shot from the rifle would get us a fine cormorant, another day the 10-bore of the party bagged two big wild geese, one or two heron skins we had preserved. The sand grouse were plenty; the fellahs had no objection to our killing their pigeons. One day a fine old sacred hawk was bagged by Mr. B., and many lovely skins were in our collection, beautiful, fast-flying, blue and green bee-eaters, while paddy birds, water wagtails, the black and white kingfisher, the queer looking, gravely strutting hoepoe, ducks, a few snipe and many more that I forget, were brought to bag never killing just for killing's sake, but enough for the table, and to get pretty skins.

Beautiful ruins without number are passed on the way; many are our excursions on shore, and a fine time is always the order of the day.

We passed under the great cliffs, and by the winding turn in the river, at Gebel Aboofayda, we saw the tombs cut in the stone, the openings into the cliffs, all those works rather of giants than of men, and in time, after stranding on sandbanks a few times and having our crew hop out in the water and all getting their backs under the side of the dahabeah and shoving us off, we reached Siout, where we stopped to make bread for the sailors. I could tell you lots about the place, and many other places, but I am trying to make a long story short, and as I only traveled as a young sportsman, more interested in ducks than in ruins, and as my description would be sunk into insignificance by the side of so many entertaining and ably-written volumes, I must just go on with the journey and interlard a little shooting where I can.

Well, at Girgeh we stopped a while, and old Mr. B. was struck with a bright idea. "Let's have a pigeon shoot," said he. We hurrahed and went to work. Pigeons were only a few pence apiece, and with two old segar boxes and two strings we made traps, the sailors were enthusiastic trappers and excellent retrievers, and the writer must say that, although the youngest of the party, he did not pay for the sheep which the loser had to buy for the crew, a way of putting it fully in accordance with his reputation for modesty.

We passed the sugar factories at Farshoot, we saw the holy old chap, Sheykh Something or-other, who had sat on his haunches for fifty years, depending upon charity to feed him, as he never, during that time, has raised his hands to his mouth. I would not speak disrespectfully of that saint, for he deserves richly one eminent title, the proud name of "champion dirty man of the world."

The day after we saw a crocodile, at least we thought it was an old log, but the Reïs and dragoman swore it was a crocodile, and of course it was our duty to believe them; but as the wind was blowing well we could not stop to give him a hunt. Well, at last we got to Denderah. Many fine ruins we saw there, the wonderful temple and hosts of others, and here two fine running shots, in the evening, as we were walking toward the river, put two Winchester bullets through our first jackals. From here we went on to Karnak and Longsor, and after inspecting the grand ruins there, we proceeded to Esneh, where we baked once more for the sailors. We did some shooting here for a short while, and sailed off again for Assouan, which we reached in due time.

Now the cataracts—the first—were reached, and Nubia was extending far away, Egypt lay behind us. Arrangements were made with the Sheykh of the Cataract, and after sharp bargaining we had it all arranged that for £12 we were to be hauled up next day. Well, I suppose everybody has read about going up the cataract; how the dahabeahs are hauled up with ropes, hundreds of men hauling up one rapid into one pool, and from this pool over another rapid, and so on, tugging like mad, shouting and yelling until you are at the top, and you think that they have earned their money. We soon got to Philæ; here we tarried a short while, and we would go for walks along the shore, and at the crack of the breechloaders fine birds would be brought to bag, and great was our amusement when some of the Nubians, seeing us shoot and open the guns to withdraw the shells, would exclaim regretfully that the "Englees" had broken his gun, and wonder ever after at its being mended so easily again. The country beyond Philæ becomes wilder than ever; water fowl abound; here and there a few buffaloes wallow in the mud; at night the jackal howls and dogs bark. Go a little further, and late in the evening a wonderful silence reigns supreme, interrupted by the cry of some water bird, or some dog away off, or some one of the unexplained noises heard in all solitudes.

Next day, as we were going up the river, Mr. B., who was watching for crocodiles, saw one on the sand. Quickly we got in the small boat, rowed carefully and silently around a sand-point. At last we reached fairly near the monster; a sharp *ping!* "Oh, good shot, Mr. B."; it is a hundred and fifty yards at least. I take the rifle, pump in another cartridge, and another bullet hits the brute, struggling to reach the water, and after considerable slashing about of his tail the crocodile dies. Who says that a rifle ball will glance off a crocodile? I am persuaded it will not. This one was thirteen feet long.

After this we went on our journey, bound for Aboo-Simbel. On the way we had another shot at a crocodile, but he was missed, and soon he wriggled into the muddy water in safety. Here we found a good many ducks, hoepoes and other birds, plenty of material for good sport and good eating, and one day, as I killed a sand grouse with one barrel, a fine fox jumped out from the reeds near a little irrigating stream, and my second barrel of No. 4 shot crippled old reynard, whom I captured after a little run.

When Aboo-Simbel was reached, we stayed a short while, for must we not see the great temple, and the remains of the glorious reign of King Sesostris, but I often would let ruin hunting alone, for were not the shores teeming with quail, beautiful little game birds, half the size of our Bob White, but strong flyers, often in large bevies, and no mean addition to the table, *crede experto*. I felt sorry I had no dog, for, although I could kill all the game I wanted, how much happier I would have felt in blending the pleasure of shooting with that of watching a steady pointer, or a good well-trained setter, at work.

When we had enough of Sesostris the Great, we sailed on to Wady Halfeh, and soon we saw the cataract. This was our turning point. Many another fine day's sport did we enjoy on our way back to Cairo, and many times, since we returned home once more, have I thought of the snug little cabins on the dahabeah, and the many good shots we fired in the Land of the Pharaohs. G. V. S.

New York.

"LIKE THE BEAR THAT TREED JIMMY O'BRIEN."

Scene—*Rear office of Briggs's drug store.* Time—10 *P. M. Cold winter's night.* Present—*Briggs, Professor Adams, Goodwin, Dr. King, H. P. U., et al. Briggs has just finished telling one of his hunting adventures.*

H. P. U. (loquitur)—"That grouse of yours was like the bear that treed Jimmy O'Brien."

Goodwin—"By the way, I've heard you use that expression several times. What does it mean?"

H. P. U.—"Why, it's a by-word among the 'boys' out in the San Juan."

Briggs—"Yes, but what's the story?"

H. P. U.—"Didn't I ever tell it to you?"

Owner—"No! Let's have it!"

H. P. U.—"All right; here goes."

ONE day, when we were up at the cabin in Arastra Gulch, Jimmy O'Brien stopped a few moments with us, on his way over to Elk Park, whither he was going to work out an assessment on a mine belonging to him. He was on foot, driving before him his favorite burro (Mexican jackass) Mike, laden with tents, blankets, "grub," cooking outfit, pick, shovel, and other impedimenta. Jimmy and Mike were well known in that country, for they were inseparable. It would have been hard to tell which thought the most of the other. Mike would follow Jimmy about like a dog, while Jimmy never passed his four-footed friend without stopping to scratch his rough head, and give him a bit of old biscuit or some such dainty. "The Irish Twins," "The Two Dromios," "Damon and Pythias," "Romeo and Juliet," "Beauty and the Beast," "Pyramus and Thisbe," "A Pair of Jacks," "Both Bowers"—these were some of the nicknames the couple had received. But neither biped nor quadruped cared—their strange friendship only grew the stronger. The former, singular as it may appear from his name, was an Irishman,

"Long, lank and brown as the ribbed sea-sand,"

with a merry twinkle in his eye, and a shrewd, quizzical smile that betokened "lashins of fun" in his make-up. In the golden days of '49 he had deserted from an American man-of-war at San Francisco, and had passed the last thirty years of his life in gold digging in California, bear hunting with old "Grizzly" Adams in the Sierras, silver mining in Nevada, and in leading a wild and adventurous life generally from the Columbia to the Gila, and from the Golden Gate to the headwaters of the Mississippi. Not knowing what fear was, he had sense enough to know when "discretion was the better part of valor." He was now about sixty, tough and weather-beaten, but still strong and active, one of the jolliest companions possible to find, and one who, to use the expressive Western phrase, "would do to tie to" in times of trouble or danger.

He stayed with us that day only long enough to "corral a hunk of grub," and then pushed on over the dividing ridge into Elk Park.

Next day, after having wasted the better part of the morning in a vain attempt to find a band of mountain sheep, which "used" on the peaks at the head of the gulch, I found myself, about noon, looking down on Jimmy's tent in the Park below. As it was but little out of a direct line

homeward, I decided that I might as well drop in on the old man and get a cold biscuit to stay my hunger till I reached the cabin. I took it for granted he would be at work in the tunnel, some five hundred yards up the mountain side, but, much to my surprise, when I pulled aside the tent-flap I saw him inside, rolled up in his blanket, fast asleep. Fearing he might be sick—for a nap in daylight was a rare occurrence with him—I shook him, and asked him if anything was the matter. The first reply was a grunt, the next a growl, then a request "not to bother," till, finally, when I had shaken him fully awake (for I had begun to be seriously afraid that his unwonted somnolency was the stupor of severe illness) I drew out of him the fact that he was well enough, but "mizherable shlapy." Why he should be so sleepy in the middle of the day puzzled me, till he intimated that he'd been up all the night before. The explanation surprised me as much as the fact, and, suspecting from his curt speech and evasive replies some mystery, I plied him with questions, till, finally, sitting up and filling his pipe, he satisfied my curiosity.

He had arrived there safely the evening before, selected his camp ground, pitched his tent, and turned Mike out to graze. Then, hearing some spruce grouse calling, he had started out to secure a few for supper and breakfast. Leaving his rifle behind, as he did not expect to see any large game, he took only his long-barreled .38-caliber Smith & Wesson revolver, with which he could pick off a grouse's head in the top of the tallest spruce. Having shot four or five, he started for camp, it having, by this time, become quite dusk, for darkness comes, here in these hills, almost as suddenly as in the tropics. On turning the corner of some fallen rocks, at the lower end of the little glade in whose upper point his tent was pitched, he came suddenly upon a huge grizzly, busy, as well as he could see in the gathering darkness, in digging up wild parsnip roots for his supper. Before he had time to dodge back under cover of the rocks, the bear had seen and started for him. I will let him tell the rest of the story in his own words.

"Divil a little time had I to be thinkin', for it wan't twinty yarruds he wor frum me whin I first see him, but I knew 'twor no use thryin' to run, an' as fur fightin', me .38 wadn't be a flay-bite to the likes av him. As luck wad have it, right forninst me was a majium-sized shpruce, an' oop that I wint like a wayzel, hopin' that av I didn't shtop to discuss the matter wid 'im, he'd be afther re-*cog*-nizing me civility, an' pass on, an' lave me. Not he! Oop he cooms to the fut of the three, shnuffs around it, roobs the dirthy head av 'im agin it, luks up at mesilf, perched jist beyant his rache, goes off, cooms back, goes through the same manayvers, an' afther a while, findin' he cudn't deludher me into anny kind of a dishcushin wid 'im, falls to faydin' agin. 'Twas so darruk, I cud only jist see the big black carcass av 'im, wandherin' around like a naygur's shpook in a cimmytairy, but 'twasn't mesilf that wor cravin' anny nayrer inshpection av 'im. I wor aizy enough wher I wor for the prisint, barrin' that a six-inch limb ain't quite so comfortable a sate as a pile of blankets, and that 'twud have bin more gratifyin' like to me shtummuck, av I'd had a could pratie or two alang wid me. 'Howiver,' thinks I to mesilf, 'whin he's through atin', he'll go aff quiet an' dacint like, an' the ould man'll git back to camp in time to git a good shquare male for himsilf yit.' But, divil claw the oogly hide av 'im, phwat does he do, when he'd got hiz own dirthy shtummuck full, but coom back to the three, walk round it wanst or twicet, and thin lie down about tin yarruds from the fut av it.

"'Ah ha!' sez I, 'tis that ye're up to, is it? Goin' to shtarve me out, are ye? Will, will, av I kape whisht, may-be ye'll be taking a gintale afther-dinner nap, afther a while, an' thin I'll deludher ye, an' slip down off the three onbeknownst to ye, an' av I can git back to camp an' git hould of ould Betsey, I'll be afther poompin the could lead into the ongrateful carcass of ye, till yez are as ded as Paddy Burns's pig, and then yez'll have rayson to regrit that ye caused a dacint man to make a shpec*tack*le av himself, shquattin' oop a three in this style, like a haythin moonkey on a limb.' So afther a bit, whin I thought the fine shupper he'd been atin had put him to shlape, I begins to lit mesilf down aizy, but afore I'd shlipped down a fut, oop gits the murtherin' blaggard, an' shtarts towards me. 'Twas wonderful how quick I changed me mind, an' concluded 'twasn't so very uncomfortable in the three afther all. 'Twas only playin' 'possum he waz, or maybe I'd been too precipitous like, so, whin he lay down agin, I made up me mind I'd give 'im plenty of time this time, afore I thryed 'im agin. So I waited an' waited, till my whole back was that sore wid the limbs a cuttin' into it, that I cudn't shtand it no longer, so I repayted the exshperiment, but 'twas not the laste use in the worruld, he was at the fut av the three agin, afore I'd shlid down a yarrud. So I makes up me mind to 'accipt the invitayble,' as I hear ye say wanst, an' so I reshoomed me original position, trustin' that, when daylight came, and he saw how lane an' tough I waz, he'd abandon the sayge an' layve me in payce. So there I sits asthraddle av that limb all that blissid night, till the ligs av me was so cramped they had no faylins lift, an' the teeth av me was broke, be raison av me jaws chatterin' so wid the could, an' I was that shtiff wid the frosht I was afraid I'd shnap in two like an ishickle, an' I was gittin' so hungry I could almost ate me boots; an' was thinkin' sayriously of takin' an early breakfast on could grouse. Will, whin I was almosht ready to dhrop aff me perch wid fatigue, an' hunger, an' could, it began to lighten a little in the ayste, an pretty soon 'twas light enough for me to see the forrum of me oogler jailer, plainly, lyin' close to the fut av the three." Here he paused, re-lit his pipe, which had gone out in the heat of his narration, and puffed away quietly with the air of one who has just finished a good story.

"Well, how did you get away?"

"On me ligs, av coorse."

"Did the bear leave you, when day came?"

"Not a bit av it."

"You don't mean to say you came down the tree and walked off, while the bear stood and looked at you?"

"Av coorse not."

"You certainly didn't kill him?"

"Wid a .38? Har-r-dly!"

"Well, how *did* you do it?"

"Will yez shware, by the blissid bones of the howly St. Pathrick, that yez'll nivir till, av I disclose to you the saycret av me escape?"

"What secret can there be about it?"

"Nivir you moind; not anither worrud do yez get from Jimmy O'Brien, till ye promise yez'll niver say a worrud to the byes, concarnin' the houl thransaction."

"Well, well, all right; drive on."

"Will, thin, 'twas no bear at all, at all, but that divil's naygur of a burro, Micky!"

Natural History.

PROTECT THE SMALL BIRDS.

Editor Forest and Stream:

For several years I have watched the decrease in numbers of our singing birds, and have wondered what our energetic collectors will find to prey upon a hundred years hence.

An interesting account of a day's birds' nesting in your issue of Jan. 31, has attracted my attention, and I think illustrates the mania now raging among ornithologists for the possession of immense series of birds' eggs and skins. I quote a few sentences from the above mentioned article: "We have already taken six eggs from this nest (that of *Ardea virescens*) four on the 7th day of May, two more on May 25, and to-day, June 4, we find three more. The nest we carefully leave, expecting to get a dozen more eggs from it at least, and then add both nest and bird to our collection." Again, "We take the first, containing four as pretty eggs as ever gladdened the eye of an oölogist, and then another and another, until our arms are full. Riding ashore we deposit our treasures, and wading in, we collect more, until want of carrying space cries hold! enough!" It seems to me that such wholesale collecting cannot but eventually seriously diminish the number of our birds.

I see no necessity for killing the birds during nesting time, save for the purpose of absolute identification, for if killed during migration or before nesting time, it allows time for the mate to remate and rear a brood before the season is too far advanced. It seems to me that the protection of our insect-eating friends is a serious necessity, and a line should be drawn somewhere to limit the inroads made upon them. Of course the number of birds sacrificed for scientific purposes is small compared with the slaughter for millinery purposes, which is assuming vast proportions. The beautiful cedar bird (*Ampelis cedrorum*), formerly abundant in the vicinity of Boston, has become comparatively rare. The Baltimore oriole (*Icterus galbula*), whose gorgeous plumage contrasts so beautifully with the rich green of the elms in our suburbs, has of late visibly decreased in numbers. No mansion now is considered fashionably furnished if not possessed of several owls usually mounted in horrible attitudes upon a half moon or with wings painfully distended high over the back. This robs the farmer of his best mouser.

While visiting the Museum of Comparative Zoölogy, at Cambridge, one afternoon, I heard a young lady remark while examining the birds, "What a horrid shame it is to kill these poor little dears." Glancing at her dainty hat I beheld thereto attached a bird most wonderfully constructed and composed of portions of at least two or three lovely denizens of the tropics. I thought at the time that there was a chance for missionary work among the fair sex. If the ladies could be induced to take interest in the matter and refuse to wear birds or feathers it would be an immense step in the right direction.

The State of Maine has made vigorous movements toward the protection of insectivorous birds. In Massachusetts it is proposed to put into the hands of the fish and game protective associations the matter of licenses and to impose a bond so heavy as to confine the permit to responsible parties. That this plan may succeed is the devout prayer of MERLIN.

WINTER BIRD NOTES.

THE signs of the birds seem to point to an early spring; and now that this season is at hand we hope that collectors and observers all over the country will give us the benefit of their notes, and will tell us of the arrival of the birds. If this were done systematically the amount of valuable information accumulated would be very great. We shall hope to hear from many of our readers, and shall publish from week to week the observations which are sent in.

Hornellsville, N. Y., Feb. 3.—Kingfishers, blackbirds and meadow larks have been here all the winter. Cannot well understand how they can live, as it has been a severe winter. Ice sixteen inches thick in the river, snow two feet deep on the level, good sleighing since Dec. 18, and the temperature often 20° below zero. Bluejays, many of them are seen around the farmhouses. I saw two large owls trying to catch English sparrows one evening last week, right in the outskirts of the city. On Saturday, Jan. 26, I saw about a dozen robins, which we all think here is a very strange circumstance, as Friday night at 11 o'clock it was 23° below. On Saturday and Sunday it was quite cold, but the robins were singing. Have seen none since the 28th. Heavy rains and thawing to-day.—J. OTIS FELLOWS.

Washington, Litchfield County, Conn., Feb. 4.—A robin was noticed at this place on the morning of the 3d inst. Is it not rather early for them in New England, even in this southern locality? Pine grosbeaks are abundant here.—J. D. G.

Ithaca, N. Y., Feb. 5.—On the 2d of February a man, living near a spring brook, saw a bird on the bank, which he thought was a woodcock. He killed it, and it proved to be an English snipe. When he fired only one bird was in sight, but at the report of his gun eleven more rose and flew. Most of them have been killed since. I also saw the same evening a robin. We have had an unusually severe winter. The ground has been covered with snow from six to ten inches deep, since the 25th of December, and cold all the time, which makes the occurrence something unusual.—W. H. W. [The occurrence of snipe near Ithaca at this season is quite unusual, though not without precedent. As we have frequently remarked, the cold does not appear to be always the moving cause of the southward journeying of snipe and woodcock. So long as the feeding grounds of these birds remain open a few of them will remain with us and brave even the severest weather.]

Perth Amboy, N. J., Feb. 15.—St. Valentine's Day was signalized here by a thunder shower, during which a tree toad chirruped merrily. And when it was over, a bluebird, on the top of the old pear tree, gave us a snatch of a spring song, while the mercury touched 62°. To-day it indicated but 27°, and the toad and bluebird—where are they? Two immense flocks of bluebirds were also seen, flying southwest. Could they have foreseen the cold wave?—J. L. K.

Ferrisburgh, Vt., Feb. 14.—We are just at the tail end of a big thaw which has nearly spoiled the sleighing and set the brooks a-roaring. A few crows have been hanging about here all winter in spite of deep snow and severe cold, an unusual thing for them to do in these parts. I think I told you of the grosbeaks being here.—R. E. R.

Irvington, N. J.—While walking in the woods on Jan. 20 I was surprised to hear what sounded like a robin, and while looking for it another one flew into a tree near by. I have seen them here in New Jersey in the latter part of February, but never in midwinter. The thermometer registered 15°, and the earth was covered with six inches of snow, yet the bird was in no way affected by it. I have known them to be so benumbed with the same degree of cold as to be easily caught in the hand. Like the late breeding of squirrels, it's another sign of a mild winter.—F. H. B.

New York, Jan. 13.—While out the other day in New Jersey on a snow-shoe tramp for the purpose of feeding quail, we came across a flock of a dozen wild pigeons. It is very unusual to see them at this time of the year, and during so severe a storm.—W. HOLBERTON.

Manton, R. I., Jan. 21.—A friend and myself went out without guns the other day and found the remains of two coveys of quail within a half-mile, seven birds in one and five in the other. They seemed strong and in good feed ground. On our trip I saw quite a large flock of robins and about a dozen pine grosbeaks and some gray linnets. Taking the weather as we have had it so far this winter, I thought it strange to see so many robins; they all looked fat and strong. They have been seen a number of times this winter in cedar trees near my house. We have a good lot of partridges (ruffed grouse) left over, but gunners are hunting them every day that the weather will allow them to get out, and they go some very bad days at that. The law is wrong to allow them to kill partridge up to the first of February.—T. M. ALDRICH.

Barrie, Ont., Feb. 7.—In your last number for January I read an article on late snipe, a Wilson snipe that was shot on Dec. 23, 1883, at Cleveland, O. Allow me to tell you about a Wilson snipe shot here on Jan. 23, 1884, by a Mr. Vair on his stream, Barrie, Ontario, and where we have three feet of snow and the thermometer 36 degrees below zero. A more perfect bird I never saw; it was in good plumage and as fat as butter. I may still say it was in such good condition that we have decided to have it put up by our taxidermist, Mr. Wright.—S. D. BEATTY.

FORESTS AND FLOODS.

FOR many years thereafter the flood in the Ohio River of 1832 was called by the settlers along its banks the "great flood." Its like was unknown to the oldest inhabitant. It was fifteen years till another comparable with it occurred, and the flood of 1847 was not as high as that of 1832. But within the last three years there have been two surpassing that of fifty-two years ago—the one now on being the most destructive of all. And yet the news gives no reason to believe that the water discharged from the clouds this year equals the discharges of 1832 and 1847. In 1832 the rains continued in torrents for several weeks; this year for not more than half or a third of that time. There is an apparent mystery in this which will set millions of people to thinking, more especially those who inhabit the banks and rich "bottoms" of that most beautiful river, and whose property is in peril of periodical destruction from these rapidly increasing occurrences.

The Ohio in its length—1,000 miles—is a river of the third class for America, and of the second class compared with European rivers. After the Missouri it is the chief tributary of the Mississippi, discharging more water than either the Arkansas or the Red River, though not as long as either of these. It is formed by the Alleghany and Monongahela, both rising in the Alleghany Mountains, and fed by snows till as late as the middle of May. Below the junction of these two mountain streams, which is at Pittsburgh, the principal affluents of the Ohio are the Scioto, Kanawha, Big and Little Miami, Kentucky, Wabash, Cumberland, and Tennessee. These affluents drain three-fourths of the State of Ohio, more than half of Indiana and Kentucky, nearly all of Tennessee and West Virginia, and, including the Alleghany and Monongahela, half of Pennsylvania and a considerable part of Virginia. The area of drainage into the Ohio can hardly be less than 100,000 square miles, and of this at least six-sevenths, probably nine-tenths, was sixty years ago covered by dense forest. The original prairie lands of the Ohio were insignificant. Forest was the prevailing quality of the land along the Scioto, the two Miamis, all through Kentucky, Tennessee, Western Pennsylvania, and Virginia, and Indiana from the old National Road southward was covered by beech, walnut, poplar, and oak, with but here and there a small "clearing." The rain that fell upon these forests sunk into a thick stratum of leaves, the deposit of ages, and was there retained for weeks after it fell, finding its way slowly into creeks and rivers, which accordingly rose slowly. Within the present generation the whole region from the Little Miami to far west of Indianapolis and thence south to the Ohio was comparatively a swamp from the beginning of the spring rains till as late as the middle of June. The rule, with some modification, extended to the whole area drained by the Ohio. Now all is changed, It is safe to say that four-fifths of the primeval forests that covered the Ohio valley as far back as 1820 have been cut away—for railway ties, fences, fuel, lumber, and timber for houses and barns—converted, so to speak, into railways, farms, villages and towns. These are, to be sure, not inconsiderable compensations for the losses by floods, but they are the cause of them all the same. We search in vain for any other cause. The Ohio is not filled up in its bed, as are the Sacramento and San Joaquin, by detritus. It is navigable now from its head to its mouth by boats of as deep a draft as plied upon it thirty years ago. Its banks are as high as ever and as far apart. It is as capable of carrying as much water now as when the Indians hunted in its woods. The difference is that it is now called on to discharge in a week the same quantity of water that it formerly received in a month or six weeks. The leafy forest reservoirs are cut away. When an eight or ten inch rain fell half a century ago, more than half of it was held back from the rivulets and rivers by these reservoirs. Now all goes at once, and if the rivers cannot contain the influx, of course their banks are overflowed, and farms, villages, and towns swept away.

This is the common-sense explanation of the mystery. The compensation of the flood calamities is found in the exchange of the primitive unproductive forests for farms, orchards, meadows, flocks, and herds, and the other concomitants of the thing we name "progress." The partial remedy against these wholesale destructions by flood lies in the restoration of the denuded forests as far as is consistent with that cultivation of the soil which the increasing population of the country demands. It is a remedy which might be more practically and profitably enforced in the valleys of the Sacramento and San Joaquin than in the States drained by the Ohio. Tree culture in our valleys, while

contributing toward the prevention of sudden overflows of the rivers, would not curtail the area of profitable agricultural production, for an acre of well-shaded land is worth more for pasture than for grain, and we are shorter of beef, if the butchers may be believed, than we are ever likely to be of bread.—*San Francisco Chronicle.*

Game Bag and Gun.

WOODCOCK COVERS NEAR NEW YORK.

THIRTY years ago last summer, within one hundred yards of where I am now writing, I killed my first woodcock. Although but a short time had elapsed since I had been allowed to carry a gun, I had already created sad havoc among the various birds with which the salt marshes in this vicinity at that time abounded. But the killing of this first woodcock started a new era in my shooting career; and though two years at least elapsed before I was able to kill more than an occasional bird, the most of my spare time while they were in season was spent in their pursuit; and the quantity of fine shot I scattered about the swamps and springholes was simply incredible. Well do I remember the disgust with which a city cousin followed me on one of these probationary hunts, through mud and brush the greater portion of the day, returning at night with empty powder flask and shot pouch, and one solitary woodcock. This one, however, had fallen to my gun, and I at least was satisfied.

This constant practice, backed by a love for the sport that no amount of poor luck or hard work could dampen, began at length to have its effect, and I would occasionally bring in quite a respectable bag. When one summer afternoon after a hunt with Tilman Holly, the acknowledged crack shot of the time in this section, when I had killed my full share of the birds, my reputation as a fair shot was firmly established, for to hold one's own in the brush with Holly at that time, was a feat few cared to try; and most of those who did try failed to perform.

Holly, though growing old, is still a good shot; and only three years ago last November I met him very early one frosty morning in what is locally known as Bussing's Sprouts, a large tract of splendid fall woodcock ground, about one mile east of Woodlawn Station. He informed me that birds were plenty, and that he had already killed seven. Hunting together we killed eleven more, making a bag of eighteen woodcock in a forenoon, and that too within one mile of the northern boundary of New York city.

When I first began to shoot, probably not more than eight or ten hunted over setters or pointers within a half dozen miles of this place. The first whom I remember to have seen following the dogs in the field was Joseph Thwaites, then keeper of a hotel known as the Sportsman's Inn. As a boy I never passed this place without stopping to admire the sign, on which were painted two dogs on a point and a sportsman in the act of shooting. Thwaites had a habit, and a very good one, of cocking his gun as it went up to his shoulder, and was the only sportsman I have ever met who did it. He died a few years since, when he was past seventy, and only a few months before I met him in the Sprouts mentioned above, working his dogs with as much ardor and zest as a lad upon his first hunt

Another of the old-time shooters was Malachi Briggs, now living near Williamsbridge. Though showing unmistakable signs of advancing age, he is still hale and hearty, and may be often seen during the shooting season, with his old pointer, searching all the best spots (and no sportsman knows them better) for any stray woodcock that the Wards, Weeks, Peter Briggs, and the host of other shooters who dwell in that vicinity may have happened to leave.

About half way between the town of East Chester and Thwaite's, which was near the town of West Farms, on the road leading to New York city, was the Drovers' Inn, long since burned down. This was a favorite resort of woodcock shooters from the city; and these were almost invariably under the guidance of Solomon Hesdra, a barber doing business in Spring street. "Sol," as he was almost always called, was an inveterate hunter, a good shot, and a great lover of the dog; and my first lesson in dog lore came from him. In later days he followed his vocation in the village of Mount Vernon in this town. Every Monday morning during the shooting season the shop was left in care of an apprentice, and with Shot, his setter, following at his heels, Sol. would wend his way to the swamps. On more than one of these occasions I have enjoyed a hunt with him, and many a valuable hint in regard to my favorite sport has he given me. Like Thwaite, he hunted almost up to the time of his death. Many of the city readers of FOREST AND STREAM will remember Sol. and his quaint, genial way.

Taking the village of East Chester as a center, there was probably more good woodcock cover within a circle of five miles at the time of which I am writing than could be found within the same area anywhere within thirty miles of New York city. About eighteen years ago most of the covers in the towns of East Chester, West Chester, and Pelham were cleared off and the grounds exposed for sale, as a regular mania for land speculation arose about that time. Some of the covers were drained and destroyed forever; but some of the best of them, especially in the town of West Chester, are fast growing up; and if left alone will soon furnish good sport again. Last season I killed a few birds on this ground, where the growth had been the quickest. In the town of Pelham, the village of Pelham Manor occupies a tract of land that a few years ago furnished splendid shooting. A small portion of cover is still left along the railroad on each side of the station; and I killed eight woodcock there one morning last November.

By far the best piece of ground that remains intact in this section lies west of the New York, New Haven and Hartford Railroad between New Rochelle and Larchmont. Here, one year ago last August, I made the best bag I have ever made, killing sixteen birds. This is a larger number of birds than any one man should shoot in a day where cover is scarce and shooters plenty; and I have blamed myself many times for it since. I have held, of late years, that a bag of three or four brace should satisfy any sportsman or pair of sportsmen; and I would hail a law to that effect for this county with pleasure. Last season my largest bag was nine, though I killed a large number in the course of the season. I have perhaps been dry and tedious in giving details and describing localities, but one object in writing this was to show to sportsmen in the city who so often write to FOREST AND STREAM for information in regard to shooting grounds within one hundred miles of the city, that a fair day's sport can often be had much nearer than that by those who know where to go and how to shoot after they get there. I have given a slight sketch of such of the old time sportsmen I was most intimately acquainted with. The younger ones I will not attempt to name individually, as it would take too much space, but they are thickly scattered all over the country, and setters and pointers are as plenty as false points and flushes at a field trial.

I am well aware that I have departed from the usual style in writing upon the subject of summer shooting and I have often been amused at the way so many writers of the day have in dealing with the subject, the birds called callow fledgelings and their inability to fly and take care of themselves conclusively shown on paper. I should be sorry to see the season open in July, but candor compels me to say that during the many years I hunted them when it did open at that time, I never but once saw a bird unable to fly, and that was undoubtedly the offspring of a bird whose first nest had been broken up. By the first of August the birds are well scattered and hard to find. Even in the days when there was plenty of cover, it was a rare thing to get a large bag of birds in August. During the twenty-seven years that I suppose I may, without egotism, claim to have been a fair shot, the most birds I ever killed straight in the summer was seven, while I did the same thing on fall birds twice last season alone. But when I speak of killing consecutive birds I mean shooting at every bird pointed, walking in to the right or left of your dog and flushing it yourself, and when it rises, the little open spot you had your eye on and was quite sure it would fly through will probably be in an entirely different direction from the one it will really take as it whistles up under your feet. You will turn to see a buff and brown streak disappear amid a cluster of shaking alder leaves. When you can on the instant throw up your gun close enough to those quivering leaves to kill the bird flying behind them twice out of five times, you will be doing better shooting, in my opinion than to bring down four out of five as they rise over the tops of the leafless sprouts in the fall. That I am not alone of this opinion, I know, as I have never met a first-class snap shot who questioned the justice of it. Two years ago it was my good fortune to make the acquaintance of a No. 1 shot, fit to hold his own in any company; one of those so seldom met who seem to be to the "manner born," he, too, had imbibed the idea that an August woodcock was very easy killed, but a few outings in the dense covers of this section convinced him of his mistake. I have another splendid shot in my mind, a young lawyer from the city, who for seven years has never failed but once to be on hand the first day of August, and then he came on the second. I fancy I can see his quiet incredulous smile should any one suggest to him that an August woodcock was an easy bird to bring to bag. J. H. D.

EAST CHESTER, N. Y.

My observations of the woodcock are perhaps new to some of your many readers. I live near New York, and all my shooting is in a circle of twenty miles around the city, and I get as much pleasure out of one single woodcock as many sportsmen (who live in more favorable country grounds) get out of a dozen. I look for them on the hillsides, in swamps and oak brush, in briers, blackberry bushes, cedars and ledges along streams. I have found them in open woods, cornfields, meadows and grass lots, and in fact every place where the soil is soft, no matter whether wet or dry: The common notion of sportsmen is that the woodcock get their food only by boring, but they will turn over fallen leaves and pick up from the ground, as well as bore. I have killed a woodcock with a green caterpillar in his bill, two and a half inches long, which he must have picked up from the surface. When I go to my favorite places, which are generally thick and difficult to shoot in, the dog will crawl right up to within a few feet of the birds, and leave his point when I command him. Woodcock will stay in one place all summer and fall, as long as there is anything to eat; and will shift ground as soon as the place gets too dry or otherwise unfavorable for food, but will return after rain, and they will not leave until driven away by very hard frost or snow. The flight of northern birds may be on or not, the birds which are bred here will stay until they can feed no longer. Some of these birds I killed on Thanksgiving Day, and am positive they were the same birds I had seen during the summer, because one had a crippled leg which he had hanging down, and the other was in a very small secluded spot not more than thirty yards square, where I had seen him very often before. Traveling woodcock, if disturbed in daytime, will leave the place in the evening, and not return even if the condition for food is favorable. I killed last season about forty woodcock, a few every week, which I think was very good for being so close to the city. DOMESTIC.

BROOKLYN.

MASSACHUSETTS NOTES.

THE season of sport in field and bush closed in our State on Jan. 1, with the exception of fur and wildfowl, who must court shy of the gun until a later date.

The season as a whole has not been very satisfactory to most of our sportsmen. From early in the summer a very severe drought prevailed until about the middle of autumn, much to the disgust and perplexity of many of us, who, during August, turned our steps toward favorite grounds hoping to bag a few woodcock. Such outings, as a rule, were made with discomfort, faces streaming with perspiration, the ground dry and parched from drought, and few or no birds to reward us. Some of the old veterans, whose heads are sprinkled with the silvery threads of many winters, wended their way to moist corners of cornfields, shady old orchards beneath whose leafy retreats it was always moist and cool, or to some partially exposed overflow near pond or stream. In such places these old wiseacres often obtained good sport, to my knowledge making some splendid bags, and exciting the envy of many among their fellow sportsmen.

The flight shooting in autumn was of the poorest, very few birds stopping at all, and the bags very light and unsatisfactory; but, however, the boys managed to secure a few woodcock to sandwich in with the very good bags of ruffed grouse obtained by most of them throughout the season.

The opening of last spring bolstered up our drooping spirits with promises of good ruffed grouse shooting in the fall. The birds hatched out early and broods of goodly numbers were located in every direction, and when the season opened on Sept. 1 they were found, in numbers sufficient to satisfy, in nearly every swamp and alder run known for miles around us. But during the month last referred to no very great bags were secured in this vicinity, while during the latter part of the season, when autumn's golden garb of sunset hues had settled over the forest, this grandest bird of them all, steeped to his eyes in woodcraft, rises from behind us, and with rapidly beating pinions shapes his course to some distant covert, while the pathway of his arrowy flight is marked by falling needles from the pines. When his course is marked, we follow to his hidden retreat among the scrub on the hillside or into the depths of some almost inaccessible swamp. He rises from beneath our very feet, and with roar of wing makes a break for liberty. Then, when fortunate enough to cut him down in his flight, what pleasure steals over our delighted senses as we hear the telltale thud upon the ground and are guided to the fallen patriarch by the quickened wings beating out his death roll. It is with love mingled with sorrow that we raise him from among the leaves and stroke his glossy plumes. Scores of from fifty down to smaller figures have been made by our sportsmen for the entire season. Quail have been quite plentiful, and goodly bags of these gamy little birds have fallen to the guns of this locality. There were many birds left over at the close of the season, and if given a chance to care for themselves without any assistance from the netter, all looks very favorable for good shooting next October.

We have here in Lowell two large and powerful gun clubs, who, with the assistance of some other gentlemen, act as a powerful influence to promote the protection of fish and game. The methods pursued by them will compare favorably with those of other organizations throughout our State. On pleasant days, when it is suitable for a tall hat to be out, you will find them at their club grounds one day each week, earnestly at work shooting at glass balls and clay saucers. When not thus occupied, I presume they are earnestly wrestling with some other means of game protection. There are here with us a number of men who are the owners of forests, and it is well known that they use them, too.

Some prominent glass-ball smashers were detected during July, a month before the close season expires, hunting and killing woodcock. Gentlemen well known for years as leading citizens of this place were detected hunting woodcock out of season. When discovered and approached by others, they with more than ordinary celerity concealed their guns in the bushes behind a large tree, and were very busy giving the dogs a little harmless exercise. One other sportsman (?) has the worst case of all to answer for. He was out killing woodcock one day, and, when returning home for the night, confessed (to parties whom he chanced to meet) that he had five ruffed grouse killed by him that day in his bag along with his woodcock, and this early in the month of August, a whole month before the open season on ruffed grouse.

WILD TURKEY STORIES.

I.

IT happened in old Kentucky, before the late family troubles. It was midwinter. The La Belle Riviere, which ran past the front gate of Longview, my beautiful home, was bound in plates of ice; the winter had been long and cold—excessively cold for that latitude. The snow had been falling for two days, and the ground was wrapped in a mantle of white over one foot in thickness.

Sunday morning broke clear, sharp and frosty. The household had settled down to a peaceful day's reading. I was deeply interested in one of "Graham's Magazines" when Allen, the colored man who had charge of the horses, came into the room, hat in hand, almost out of breath, with the astounding revelation that "thare's a big gang of turkey back of the barn." Down went my book, on went my boots, and I was in the hall picking out a gun from half a dozen that stood in the corner. Among the rest was an extra fine double gun, 16-gauge, 7¼ pounds, furnished with a sling, the property of a guest, Captain Thursby, who had crossed the plains several times to California and back; and this gun had been specially made to shoot ball and buck, and had cost him over three hundred dollars. The captain told me to take his gun, which was then loaded for deer or turkey. So, picking it up, I hurried out to the barn, where I saw the gang in full flight for the woods, half a mile distant. The sight warmed me up, and I hurried after them. Reaching the beech woods I saw them quietly scratching among the trees, some two hundred yards distant. In my endeavors to steal up to them they saw me and took wing, flew but a short distance and alighted. I followed, they running through the snow, I slowly gaining on them.

About one mile back from the river and running parallel with it was a narrow, deep slough, some two miles long; the water in winter ten or twelve feet deep, the banks close enough for a large tree to span the water, and the darkies had thrown large trees across for foot logs, to serve as bridges in their 'coon hunts. One large poplar tree thus used was fully ten feet above the water.

The turkeys were making for the hills and crossed the slough not far from this tree. I tried the ice; it would not bear my weight. I hurried for the poplar tree, mounted up on it, and, stooping, started across, keeping my eyes on the flock close by on the further bank. The footing was slippery, but I never gave it a thought. When half way across one of the gang came right for the treetop, not having noticed me on my high perch. I raised my gun, took aim, fired; and the next moment my head struck the ice ten feet below where I stood, and I went to the bottom head first, gun and all. How I got out from that ice-bound water is a mystery to this day. All I do know is that I got home as they were sitting down to supper, completely exhausted, my clothing frozen hard as a board. Did I kill the turkey? Yes; and next day the boys fished up the gun and brought home the turkey. This was my first and last Sunday hunt.

CAPE ROCK.

CAPE GIRARDEAU, Mo.

II.

I have been shooting and fishing for a great many years, my first jaunt being before I donned knickerbockers, but I never knew what shooting was until in the fall of '71 I joined my regiment then serving in Northern Texas, that hunter's paradise, where at that time was to be found almost every kind of game, both bird and animal. How I look back now from the cold bleak country about Boston and think of the days past at Fort Richardson, then on the extreme frontier, and sigh for the flesh pots that at that time I did not know how to appreciate. It seemed to me that every kind of shooting was to be had, and no one was able to tell what it would be the next moment. You might be "loaded for bar" and find quail, or you might be loaded for quail and meet a noble red man who required your attention, the latter game, however, all men were prepared for there at that time. I never hap-

pened to meet a "red," although once in a very badly prepared state I met an enormous panther that scared me nearly as much as would an Indian. I was hunting for gray squirrels and came across his majesty very unexpectedly. He was as badly scared as I, so by mutual agreement we each went off in opposite directions. He was a magnificent animal, and I thought then he was about the size of a full-grown Norman horse. He may have been a shade smaller.

The finest sport to my mind was hunting the wild turkey. I don't mean going into the roost at night and killing the poor birds without giving them a chance; that kind of turkey shooting is mere slaughter, entirely unworthy the name of sport. I have shot in the roost, but only when I wanted meat. In the fall of '72, the General commanding the Department was coming to Fort Richardson on a tour of inspection; and Gen. Mackenzie wished to give him a game dinner. To that end he suggested to Col. Buel (now dead) that he had better take a hunt and see if he could get some turkeys and game. It was arranged that Buel and myself should take such a trip. I picked out about a dozen soldiers who were good hunters. We drove about eighteen miles, went into camp, and as soon as we had a little lunch and a cup of coffee, all hands except the camp guard started out, and that night we had quite a nice showing of turkeys, all hands making their suppers upon turkey livers.

Sunrise the next morning found all up and ready for work. I proposed to give my attention to ducks and did not feel that it was incumbent upon me to start quite so early. This may sound paradoxical to duck shooters who turn out before the night is half over and sit in a cold blind two or three weary hours waiting for the ducks to begin flying. The shooting there was different. The stream was small and full of ducks and our method was to slip up to the bank above the stream, flush the ducks and then give them both barrels, pick up the dead, drop back from the river and repeat a little lower down or higher up. The time of day had no influence upon the shooting. However, I did not go for ducks, I went for bear and killed the largest white-tailed deer I ever saw, and this not two hundred and fifty yards from our camp. I took him to camp and then, too much elated to hunt for ducks, I started for turkeys. In the meantime one of the soldiers had killed another deer.

The second night our stock of game was much increased. It was determined then that at 11 the next morning we would break camp and go in to the post. Early in the morning every one was out to get just one more shot. At 11 all hands were in; camp was broken, and as happy a lot of men as you ever saw took the road for the post. When we left on Monday morning General Mackenzie had said to us that he would want every bit of game we brought in, and that we should send it all to his quarters. Knowing there had been no frost, and that we would be unable to shoot in the roost, he thought we would not succeed in getting more than eight or ten turkeys; and other game he did not count upon at all. Being good soldiers, always obeying orders, we sent the wagons to the General's quarters and unloaded upon his front porch the two deer, a number of ducks and prairie chickens and one hundred and seventy-four wild turkeys. He did not keep all the game. Every man, woman and child in that post had a turkey dinner next day.

We did not keep any record of the game other than the turkeys, we killed between 3 o'clock on Monday afternoon and 11 o'clock Wednesday morning one hundred and eighty-one wild turkeys, and not one was killed in the roost, they were all killed on the ground, and then only after the hardest work. SAXET.

SQUIRRELS AND RIFLE SHOOTING.

Editor Forest and Stream:

Noticing the communications in your recent issues relative to the breeding of squirrels, etc., I am constrained to send a few "egotistical" notes. My boyhood days were mostly spent in Northern Ohio, on the "Reserve," which down to 30 or 35 years ago was a wonderful region for small game, as many of your gray-headed readers can testify. And some of the game was not so very small either. I remember during the winter of 1852-3 shooting two very fine deer one day within fifteen miles of Cleveland, and within a mile of the C. C. & C. R. R. (with a plain hunting rifle, 90 to the pound, round bullet), both deer being on a "dead run" when shot. From the time I was large enough to load a rifle my entire pastime was this fascinating practice. I have killed thirty squirrels (black and gray) in half a day. I supposed all old squirrel hunters were aware that these rodents bred twice each year. I have shot numbers of young ones—not fully grown—in September.

I occasionally receive letters from young men, even yet in their 'teens (whose parents, grandparents or other old friends I knew while I was yet young), inquiring for rifle shooting points, hunting, etc. It affords me much pleasure to reply to these young men, although sometimes done at the expense of time, which I can ill afford, but I honor them for choosing a pastime so inexpensive and healthful, instead of lounging around villages and drinking or smoking resorts, though I fear some of them have acquired the filthy tobacco habit. In this connection I wish to write them a brief, secular homily.

Whenever the opportunity has presented itself I have always tried titles with the best marksmen I have met, and have never been beaten in "string" shooting, the only accurate test of marksmanship. The most proficient competitor I ever met was a Methodist Episcopal clergyman of the Troy (N. Y.) Conference, the late Chaplain Barber of the Berdan Sharpshooters. I well remember one warm winter day while our army was in winter quarters in front of Fredericksburg, our regiment being in camp near Stoneman's Switch, that the chaplain and myself practiced continuously the entire day, stopping only for dinner. We tried five and ten shot strings, mostly the latter. During the forenoon I steadily beat him about two inches on a ten-shot string. Just before dinner he desired to try a five-shot string with my rifle. The result showed that my string measured but five-eighth of an inch less than his. After dinner he expressed a desire to use my rifle for the afternoon, which I cheerfully granted. Leaving his own rifle at quarters we fired alternate shots with my own till darkness prevented. Our strings all ran less than an inch apart, and the last one was but three-eighths of an inch, I having beaten him but that much in ten shots. As we were returning to quarters he remarked: "Captain, I think you have the best rifle in the country, and with such a rifle a man who has never used intoxicating drinks or tobacco in any form is not readily beaten in a day of steady practice."

In conclusion, I wish to say to young men that with my nervous, sanguine temperament I could never have attained the proficiency in steady marksmanship which I did but for my abstemious habits.

When I commenced this article I intended giving the boys some points on squirrel shooting with a rifle, but my article is already so long that I will defer those "points" until another time. MILTON P. PEIRCE.

PHILADELPHIA, Pa.

NEW YORK GAME PROTECTORS.

Editor Forest and Stream:

Some one asked in FOREST AND STREAM that we have a report (for publication) from the game protectors, that the tax payers can see what has been accomplished in the way of enforcing the law and for the protection of game. I frequently shoot ducks on the Hudson River. Last fall (1883) I noticed that the law was violated every day (or evening) by persons shooting after sunset, and while the ducks were on their feeding grounds for the night. I wrote to a gentleman in Hudson who is intersted in the protection of game, and he said that he had already called the game protector's attention to this fact. I have never heard of any arrests, and know that the shooting continued, and if I am credibly informed, the report of the guns of violators could be plainly heard at the residence of the game protector. I noticed in a Hudson paper that he had arrested a poor old man at Newburgh for catching a bass of less than one-half pound weight, and that he was away from home when wanted at Greenwood Lake (and by the way the Greenwood Lake business is a puzzle to me as well as many others). Now what has our game protector accomplished; I say our game protector, as he is the man we look to here. TAX PAYER.

ALBANY, N. Y.

From the current report of the Commissioners we take the following extracts bearing on this subject:

"By the act, Chapter 317, Laws of 1883, an increase in the number of State game and fish protectors was provided, and the force were, for the purpose of securing official accountability, placed under the 'supervision and direction' of the Commissioners of Fisheries. As provided by law, the Commissioners proceeded in July last to divide the territory of the State into thirteen protection districts, that being the number of protectors the Governor had decided to appoint. The appointments were made July 20, and as soon as the protectors had become legally qualified, the Commissioners issued to them a general order, stating that they had been 'placed under the supervision and direction of the Commissioners, and would be required, at the close of each calendar month, to report in detail their proceedings to them.'" Accompanying this order was a code of instructions.

As the Commissioners reside much distances apart as to forbid, without great expense and inconvenience, stated or frequent board meetings, and as their business with the protectors is of such a nature as generally to require prompt action, it was deemed necessary to place the management of the details of this department under one active head. The duty has been accordingly intrusted to Commissioner Sherman, secretary of the board, whose central location was most favorable to the purpose. He receives the reports of the protectors, and has charge of the general correspondence and records. Each Commissioner, however, is given the full authority of the board to issue such special directions to any protector as the exigencies may call for. The system has been found to work smoothly and efficiently. The protectors responded with alacrity to their instructions, and have been without exception active and efficient in the discharge of their duties. They have all, as directed, made reconnoissances of the territory in their respective charge, and established working relations with the district attorneys, sheriffs, and other officers, with whom they are to act in the execution of the laws, and with the game protective societies and individuals in their districts interested in the observance of the game laws. The monthly reports of the protectors, which have been made in all cases with commendable promptitude, show an amount of practical work done, which fully meets the expectation of the Commissioners. The practice they have followed, of making frequent visits to suspected places, has done much to stop illegal acts, and their prompt action in seizing and destroying contraband devices, and bringing to justice habitual offenders, has exerted a wholesome influence in places hitherto noted for defiance of law. The Commissioners feel justified in saying that under the present system more has been accomplished in the last three months in securing the observance of the game laws than has ever been done in the State before, and they have faith to believe that the continuance of the same vigilance will in a year's time secure for the game laws an observance as general as it was formerly an exception. As an example of the work done, it may be stated that the reports of the protectors show that upward of an hundred nets and other unlawful contrivances for the capture of fish, of the value of more than five thousand dollars, have been removed and destroyed within the last three months, and that many waters in which for a generation netting had been habitual, are now free from all wholesale fish-destroying influence. More than twenty indictments have been found for hunting deer out of season, and a large number of suits have been brought to a successful issue for minor offenses. These examples will have the tendency to keep old offenders in wholesome fear, and to check the spirit of disregard that has grown up, by long tolerance, of the game law. That provision of the law which authorizes the Commissioners to detail our protectors, in special cases, to duty outside their assigned districts, has proved of great usefulness. It has enabled the Commissioners to fortify weak places by rendering to local protectors necessary aid and support at points where defiance and resistance were to be apprehended. It has been found useful, too, in a class of detective work which could not be well performed by a protector whose person was well known in his district. Some inconvenience has occurred from the inadequate allowance made by law, for the traveling expenses of the protectors. This is at the rate of twenty dollars and a fraction per month, and no payment in excess of this sum is made by the Comptroller in any monthly account of disbursements, unless there should be a corresponding underdraft the previous month. This allowance may be exhausted in a single trip which the protector may be called on to make into a distant portion of his district, or, as may happen on the order of a Commissioner, into some other district; and thus the officer would be crippled in his ability to make other important trips of duty. The protectors can ill afford to pay expenses of travel out of their salaries, and in some cases it is a hardship to them to advance the means for such purposes, even when certain of reimbursement. There should be a larger allowance for travel in the line of duty; or, what perhaps would be as well, there might be a sum appropriated for use, in the discretion of the Commissioners, in cases where the standing allowance was insufficient.

DEFECTS OF THE LAW.

The Commissioners deem this a suitable occasion to call the attention of the Legislature to the defects in the present code of game laws. On this subject, they reiterate the sentiments expressed in a communication to the Governor Dec. 15, 1880. These laws have been so amended, supplemented and, as it were, polished up, that they have become confused, vague, contradictory and puzzling even to minds accustomed to legal interpretation. Special and local provisions and exceptions have been so interwoven in the text, that close and analytical study is necessary to elucidate that which should have been expressed in terms plain to all. The last material revision of these laws was made in 1879. To illustrate some of the absurdities that have crept in, the following instance is given: In a clause respecting brook trout, the former term "caught or taken" was changed to "killed." This change has rendered nugatory one of the most important provisions. The pretext for the amendment was that in a law dealing with game, terms used by "sportsmen" should be applied. In their parlance, a trout "taken" is a trout "killed," though he may be at that time flopping in the basket. "Pot-hunters" catch fish; "sportsmen" kill them. But when suits have been brought against persons for taking trout out of season, from public waters to stock private ponds, the defense has been successfully set up that the trout were not "killed," but taken alive. The poacher here gets the benefit of the literal construction of the word, while the law is defeated by the use of technical terms. This shows the absurdity of using artificial terms where natural ones would serve a better purpose. In the making of laws which everybody is expected to obey, such terms only should be used as plainly express the intent. It is unfortunate that the efforts made in the Legislature the last two years to improve the law by recodification and the correction of unwise provisions, failed, through the inability of those professedly working to the same end to agree in some minor points. The bill of the last session, known as the "Townsend bill," is, in the judgment of the Commissioners, the best considered in its provisions of any lately presented. It embodies the views of experienced and conservative sportsmen and fishermen, and its provisions would not be difficult to enforce. The "Grady bill," so called, was good in form, but had some objectionable provisions. If the good points of the two bills could be combined in one, following the general arrangement of the Grady bill, a law might be perfected which would be just in its provisions, easy of interpretation and certain in execution.

HOUNDING DEER.

The stoppage, through legal prohibition, of the old practice of "crusting" as it is called—that is of hunting deer on the snow crust when escape is impossible and a club is as potent a weapon as the best firearm—has resulted in a large increase of deer in the country known as the "Northern Wilderness." Much has been done by public officers, and by the efforts of societies and individuals the last few years, to prevent the unlawful killing of deer by this and other destructive modes, but there are still infractions which the game protectors and all others interested must use their utmost energy to prevent. But the danger now which threatens the deer is not so much from unlawful as from lawful practices. The pursuit of deer by hounds is now permitted from the 15th of August to the 1st of November, a period of two and a half months. During this time in the present year, the Commissioners estimate from the best data they have been able to obtain, three thousand deer were slain in the wilderness region. Never before did the woods so resound with the baying of dogs and the report of firearms. Every accessible position had its party of hunters, with their guides and dogs, and the unfortunate deer were driven from ridge to water and from swamp to hill to escape to-day a fate that was sure to come to-morrow. The number of hunters has become legion, and if the increase is to go on as it has done since the deer again began to appear in plenty, it will not be many years before the race is exterminated in this State. The object of the protection of deer in certain seasons and from destructive modes of hunting, is, or should be, that they may be hunted to the extent that they may be profitably used for food by those who go to the wilderness for health or relaxation; and that they may be of similar use to those whose occupations confine them to woods life, or whose homes are on the frontier where are no other means of obtaining fresh animal food. It never could have been contemplated by any wise law maker that they were to be spared in the winter that their slaughter in mere wantonness or to supply distant markets might be the more certainly effected at other seasons. One case has come to the knowledge of the Commissioners, which is doubtless the type of many, where a person, calling himself a "sportsman" from New York, camped on a stream much frequented by deer, with four guides and a pack of hounds, and in ten days' time the party had killed upward of twenty deer. The forequarters were fed to the dogs or left to rot on the river's bank. Of the saddles, one-half were given to the guides as part compensation for their services, and the remainder were shipped to the distant city. From every avenue out of the forest, east, west, north and south, came streaming out of the forest in October saddles and carcasses of deer, so that at many points the market was fairly glutted. All this, it is to be remembered, was done within the letter of the law. If there is no other way by which this wanton and inexcusable waste can be stopped, then should hunting with hounds be prohibited altogether. Those who still defend the hounding system admit that the abuses are great and alarming. They suggest that a shortening of the season, or the limitation by law of the number that one hunter or a party may kill, will serve to abate the evil. Others think that a limitation of the season or of the shipments to market will supply the remedy; but those who have looked at the subject in all its bearings, and in the light of impartial judgment hold that the only cure is to apply the axe at the root and prohibit hounding altogether. Next to hounding, the practice of floating is most destructive to the deer. The floating season is practically in the summer months, when the deer resort to the water to escape the flies and to crop the succulent food which grows there at that season. Floating drives them from these resorts, and as the deer are at this time suckling their young, the mischief done by the disturbance is only exceeded by that of the killing. Floating is the mode usually preferred by the tyros in hunting; and it is the only one which gives promise of success to the unskilled. The number of deer fatally wounded by it, and which escape from the hunter only to become food for the wolves, ravens and small beasts of prey is larger than by

any other mode. It is believed by the most conservative hunters that if no other mode of hunting were permitted than stalking, or still-hunting as it is called, the deer would lose that wildness which it is contended makes the aid of dogs necessary in their pursuit; and that their capture for all reasonable purposes would not be as difficult as at present to the patient hunter, while for consumption the flesh would be much more wholesome.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I am again tempted to "put in my oar," merely to reiterate my former inquiries upon the subject of the practical performance of our modern breechloading shotgun.

One gentleman from Texas gives us an entertaining sketch of how, after the trial of numerous guns that proved unsatisfactory, he finally selected an 8-gauge, 14 pounds weight, etc. And then tells us, somewhat with an air of triumph, how he could cut down a single duck, going down wind, at a distance of 90 yards, which, of course, his comrades, to their great chagrin and mortification, could not do, using lighter guns. Eastern sportsman are not entirely unacquainted with big-guns, had some experience with them myself in my younger days, during a tour on the Chesapeake waters, with the duck shooters of Havre de Grace and others of that ilk. I have seen single duck guns used there of 4-gauge, carrying 5 ounces of shot or upward, to say nothing of that unlawful terror, the swivel or punt gun, which had, of course, to be staunchly attached to a swivel and block in the bow of their gunning skiffs. I have not been there for some years, but I believe some of the market shooters still sneak out with these unlawful weapons. Of course, these larger guns have their uses in lake, bay, coast and river shooting; they tell a murderous tale on the vast flocks of waterfowl that congregate there. The necessarily larger circle covered by the shot, the larger and increased proportion of the number of pellets within the given space, give them that advantage over the gun of smaller caliber. Laying aside this advantage, the fowling piece or gun of ordinary caliber will kill its single duck or bird at quite as long range as its big brother, for, be it remembered, all things else being equal, we are shooting pellets of shot at our game, that individually are of the same size and weight in both guns, the large gun, however, having the advantage of shooting so vastly many more of them.

I do not believe any shotgun, no matter what its caliber, could or would kill its single birds statedly at 90 yards range. Not even a ten-inch columbiad, loaded with a barrel of shot, would do it.

Now, if it be true, as suggested by a Boston correspondent, that an eminent wildfowl shooter of that locality refuses to use breechloaders, for the reason asserted that they possess less range and shooting power than muzzleloaders; then we are driven into a still greater dilemma. I know not whether this suggestion be true. It was one of the subjects of my first inquiries through your columns.

I may have something to say in the future with respect to estimation of distances in the field.

Many sportsmen can give the result of their experiences touching the above, and thus enlighten more than one in the

BACKWOODS.

West Virginia.

Editor Forest and Stream:

In your issue of the 7th inst., "Buckeye" wishes information in regard to 10 and 12-bore shotguns. If he lived in a game country like this he would be able to make choice between the two bores. Experience would demonstrate that for small game, quail, squirrels, ducks, etc., and occasionally deer, the 12-bore would suit him best, as it will throw small shot closer, and with much less powder than the 10-bore, and at the same time ought to (and will, if it is a well made gun) do good work with buckshot that chamber well at the muzzle. Most of our hunters here kill deer with 12-bore guns, but the 10-bore is better for exclusive use among deer, turkey and ducks, because it will burn more powder and kill at longer ranges. RED WING.

Glencoe, Fla.

Editor Forest and Stream:

I have shot a pair of teal at 80 yards, measured distance. One had a wing broken, the other had two shot through the body, the shot going through to the shin on the opposite side. Charge 3½ drams Hazard FG powder, 178 ounces soft No. 5 shot. My gun is a 12-gauge, choked to 14 at the muzzle, 30-inch barrels, 8½ pounds. GREEN WING.

Freestone, California.

Mr. H. E. White writes to the Sacramento (Cal.) *Bee:*

"We are really pleased to observe that there is a growing tendency among American sportsmen to discard the great, lumbering guns that have been and still are so generally in use, for lighter weights and smaller gauges. Those who are well fixed financially can of course afford to keep two or more guns—say a 10-gauge for wildfowl shooting exclusively, and a 12, 16 or 20 gauge for small game. But men of moderate means, who can afford to keep but one gun, and who have to use that one for all kinds of shooting, from doves, quail and snipe to ducks and geese, will find a good 12-gauge large enough. The writer has never owned, but has used, guns larger than 12-gauge, and has found the latter abundantly able to hold its own alongside of its bigger brother at all kinds of game; and when it comes to an all-day tramp over the hills in quest of quail, or a heavy tramp through the soft mud of a snipe marsh, these big guns become intolerable burdens. They require heavier charges to do the equal execution with the 12-gauges, and thus in a year's shooting the owner is out considerably on ammunition. For many years past the 12-gauge has been the largest in general use among English sportsmen, the greater number using even smaller and lighter weapons. Nearly all the big guns made in England are shipped to America, where, up to the present time, they have been in demand. We know that many persons have bought and used heavy, large-gauge guns simply because they have regarded them as the more effective weapons for trap-shooting. But the day of general pigeon shooting is passing away, as the supply of birds for that purpose is yearly diminishing. The young find such ready sale in the markets that breeders and trappers find it to their advantage to sell the squabs, and old birds are becoming too high-priced to allow most shooters to indulge in the sport of trap-shooting. Therefore, the keeping of a heavy gun merely for the purpose of pigeon shooting, is going to be a losing business in the future. In the accounts published of a recent pigeon match at Chicago, we noticed that 12 and 16-gauge guns were used by several persons, and some of the best scores made last season about San Francisco were credited to even 20-gauge guns. The late George Gilbert, of this city—than whom few more thorough sportsmen ever lived—always used a little Pape gun weighing but six pounds, and the writer has seen him cut down snipe at full fifty yards with charges of 2½ drams of powder and less than one ounce of shot. That little gun could, in Gilbert's hands, be relied upon to bring down a duck at from fifty to sixty yards, and this is as much as the average 10-gauge will do. We learn that several Eastern clubs have barred the use of any gun larger than the 12-bore in their matches, and we believe that several Chicago clubs have done, or are thinking of doing, the same thing. There is already one club in California that does not permit the use of anything larger than a 12-gauge—that at Folsom, in this county. Some of the American gunmakers, noting the tendency toward smaller and lighter guns, are preparing to meet the demand for the latter, and one company, the Parker, especially, is encouraging that tendency by turning out guns adapted to the new order of things. The change from heavy to light guns must necessarily be gradual, as those who have the former cannot afford to sacrifice them; but we apprehend that most of the new guns purchased in the future will be of the lighter kind."

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

The article by Mr. T. S. Van Dyke, which has been running through your last three numbers, contains much with which I can heartily concur, especially his advocacy of a decent powder charge, and his contempt for "the unmanly fear of a little recoil."

But I must take exception to his closing paragraph, which, I think, is certainly calculated to mislead the superficial reader. He says: "There is but one possible way to give a ball weight without cutting down the velocity and that is by widening it."

Now, if he had said "initial velocity," thiswould have been all right. But as I have before pointed out, that grand desideratum, a flat trajectory, depends on a high mean velocity, and only incidentally on a high initial velocity, which of itself is very apt to be delusive, as a high mean velocity is by no means certain to result from a high initial velocity.

The mean velocity is in a great measure dependent on the ability of the projectile to overcome the atmospheric resistance. Now the atmospheric resistance due to the form of the projectile may be represented by the expression $\frac{d^2}{w}$ in which d is the diameter of the projectile and w in its weight.

As Mr. Van Dyke proposes to increase the weight by increasing the diameter, it will be seen that nothing is gained, as one increases in the same ratio as the other.

The atmospheric resistance can only be diminished in one of two ways: Either by decreasing the caliber, the weight remaining constant; or by increasing the weight, the caliber remaining unchanged. That is by increasing the length in either case.

This increase of length is attended with a decrease of initial velocity, but up to a certain point with an increase of mean velocity, while the steadiness of flight and penetration are always improved. The longer the range the heavier will be the bullet that will give the flattest trajectory, and this is more marked at extreme ranges than at moderate ones.

Thus in the instructive long-range experiments made by Capt. Greer at Sandy Hook in 1879, a 500-grain bullet with an initial velocity of 1,220 f. s. was thrown 2,500 yards with a mean velocity of 663 f. s., while the service 405-grain bullet with an initial velocity of 1,326 f. s. gave a mean velocity of but 423 f. s. The 500-grain bullet was thrown 3,650 yards, while the extreme range obtainable from the service bullet was 2,950 yards.

I know that this long-range work has no direct bearing on the hunting rifle, but I wish to show that a bullet that will give the flattest curve at one range will give a higher curve than a heavier bullet at a longer range.

Having fixed the range at which we wish to obtain the flattest trajectory, it is simply a matter of calculation as to what weight of bullet will give the best results with a fixed caliber.

To illustrate—As I shall have occasion to refer to this gun further on, let us suppose that we have fixed on a .50-caliber rifle with a powder charge of five drams or 138 grains. On this assumption I have calculated the weights and other data of the bullets giving the flattest trajectory at the respective ranges.

The results are shown in the following table in which the weights of the bullets are given to the nearest 10 grains. It may be well to add that if we increase the powder charge, the weight of the bullet corresponding to the flattest curve will also be increased, but not in the same ratio.

TABLE I.

Range, Yards.	Weight of bullet, grains.	Time of flight, sec.	Initial velocity, f. s.	Remaining velocity. At end of range.	Remaining velocity. At 400yds.
100	330	0.171	1989	1502	922
200	350	0.388	1931	1249	941
300	390	0.647	1865	1075	963
400	430	0.947	1803	981	981

The last column is added to show what the remaining velocity would be in each case, if the flight were continued up to 400 yards, and is only given for the sake of comparison.

By common consent 200 yards seems to be the range fixed upon for which the flattest trajectory is required.

Therefore, if the flattest trajectory were the only object to be gained we would accept the 350-grain bullet as being the most effective.

But there are other conditions to be fulfilled even more important than a flat curve. These are:

First—Accuracy.

Second—Energy.

Both of these conditions are obtained by the same means *i. e.*, by increasing the weight of the projectile. Thus we are obliged to sacrifice trajectory to a certain extent dependent on the use to which the rifle is to be put, the extremes being the hunting rifle shooting the round ball, and the long-range rifle shooting an elongated projectile of from 3 to 4 calibers in length.

The conflicting claims of accuracy and energy on the one hand and a flat trajectory on the other are well shown in the London *Field* trials of express rifles, from which the statistics at the close of Mr. Van Dyke's letter are drawn. He only tells half the story, however.

Let me tell it all and I think I can do so most clearly by the use of another table showing the performance of each gun at 150 yards. In this table the Jeffries gun is the one to which he refers.

TABLE II.

Trajectories calculated for the London *Field* by Maj. McClintock for 150 yards range, to which I have added trajectories for 200 yards.

Gun.	Accuracy of string of 10 shots	Energy, foot pounds	Initial velocity	Remain'g velocity	Time of flight sec.	Highest p'nt of curve, inches.
150 YARDS.						
Holland .50-138-444	29.00	1939	1784	1382	0.287	3.977
Jeffries .50-138-342	41.24	1490	1946	1402*	0.273	3.611
200 YARDS.						
Holland	.....	1577	1784	1265	0.402	7.530
Jeffries	.....	1178	1946	1245	0.390	7.422

*I make this only 1387 f. s., this would alter the table slightly to the disadvantage of the Jeffries gun.

A comparison of these results will show that Jeffries sacrifices everything to a flat trajectory, with the result that he was badly beaten in the prime essentials—accuracy and energy—while the gain in flatness of curve was considerably less than the diameter of the bullet.

If the range were much increased, the flight of the light bullet would be so wild as to be utterly valueless (if, indeed, it is not so already), while the 444-grain bullet should do fair work up to 400 yards.

These results emphasize my previous statement: that the most successful gun is not the one that will give the highest initial velocity, or even the flattest trajectory.

I see that I omitted to state in my last letter that if the .45-caliber gun is properly chambered for the 2.6-inch shell, the short cartridge can still be used with perfect success.

JAMES DUANE.

Feb. 16, 1884.

Editor Forest and Stream:

Some little time ago I suggested to Mr. Duane—who has devoted considerable time to experimenting with rifles to test the flatness of their trajectory—that difference in friction of the bullet might be the cause of a certain bullet making an extra flat curve. He answered with the theory that increased friction would give a bullet higher speed, as it would move slower through the barrel and give the powder more time for thorough combustion, thus giving greater force to the bullet. That greater force would be evolved from a certain charge of powder by increasing the friction on the bullet, there is little doubt, but it would take more force to drive the tighter bullet from the rifle at the same speed as the one with less friction would go, thus giving no advantage from the tight bullet, even granting that extra force enough would be gained to give the same speed. I contend that an increase of thirty pounds of friction on a bullet (and I have seen cases where it was nearer fifty pounds) will lessen the speed of the bullet as much as 100 grains of lead added to its weight, and to get the best results one needs to be as careful of the fit of the bullet as he would of the powder charge. Rifles of the same caliber vary considerably in the size of bore and depth of rifling, and patched bullets are made with thin, medium, and thick patches, thus you can get the same weight of bullet of three different sizes. I have found them to vary about .002 of an inch in diameter from each other, the thin patched bullet you can easily push through the barrel with a wiping rod, medium takes considerable force, and with the thick patch you cannot push it through without using other means than a wiping rod in your hands.

My experience teaches me to give more elevation when using thicker patched bullets than I find sufficient for reaching the target when shooting a bullet that will just take the rifling. The proper thickness of patch to use is one that will make your bullet fill the bore of the rifle, and the powder will expand the bullet sufficient to fill the grooves. I am speaking altogether of the hollow-butt, paper-patched bullet for breechloaders.

Had I the opportunity, should take pleasure in testing the three different patches in a rifle of proper size bore to use the thin patched bullet and report the results; by using the screens a very satisfactory test could be given them.

The proper hunting bullet, to my mind, is one equal to about 2½ round bullets of same caliber, say for a .40-caliber a bullet ¾ of an inch long, with the forward end the same shape as a round ball, same caliber; this would give about 225 grains, varying according to shape of the butt, and the amount of tin used, this bullet would be plenty heavy enough for all hunting distances to give accuracy; the shape of forward end would give greatest shock possible for its caliber, and almost any penetration desired could be obtained by hardening the bullet and using plenty of powder. Of course if the bullet was hardened much more than 1 part tin to 19 lead, the bullet would need to be enough larger at the butt to nearly fill the grooves without depending on the effect of explosion of the powder to expand it. This bullet would, I think, give greater satisfaction for hunting purposes than any to be found in the market to-day of as small caliber. With a 1-16 of an inch hole in the tip it would become an expanding bullet. A. B. DODGE.

Editor Forest and Stream:

I have been much interested in the .40-90 hunting rifle articles which have appeared in the FOREST AND STREAM. I think .40-90 will do, but leave that 500-grain bullet out for me; that belongs with the long-range rifle. Do not use too much lead in the hunting rifle. Use a heavy charge of smart powder, and harden the bullet to suit the powder. Bullets of the same hardness will not suit all kinds of powder charges, both slow and quick, light and heavy. Have some standard charge and grade of powder and bullet, and don't vary from it. If it works well to-day, it will to-morrow, and so on. Mark your sights for the different distances plain; don't scratch it on with a pin; you never can find it in a hurry. Have a system for every part, then follow it, and you will be rewarded.

What is a rifle good for if it has not power, and a large amount of it? Who wants the bow and arrow to hunt with in these days of electricity? Give us a short, light rifle

made of the best metal, of good proportions and well balanced; one that you can put up to your shoulder and feel that it belongs there. A double .40 of 7½ pounds' weight, with a powder charge of 90 grains of smart powder, makes quite a convenient plaything on fair-sized game, with but little weight to carry. Why carry eight or ten pounds of metal to shoot a .32-bullet and a few grains of powder?

Keep this hunting-rifle pot boiling till it gets simmered down to a light, powerful rifle, and don't forget to harden the bullet to suit your powder charge, bearing in mind that a long, heavy bullet upsets more with the same charge of powder than a short, light bullet, and the long, heavy bullet should be made of harder metal than the short, light bullet.

A. G. M.

WORCESTER, Mass.

Editor Forest and Stream:

I see in your paper of Jan. 3 that Peabody-Martini shows up the old style of rim and center fire cartridges with the ball smaller at butt to go into the shell, and then close the shell on to the ball. He is right in saying they are an abomination. Now, won't the manufacturers of breechloading rifles get out a new class of cartridges of .22, .25, .28, .32, .35 and .38, strong and long enough to hold twice the powder with a ball longer and straight so as to fit in shell without closing in at all? This would secure greater accuracy, longer range and flatter trajectory, which is quite necessary for a hunting or sporting rifle. Now, I hope every one interested in small-bore rifles will lend a hand and see if this thing cannot be brought about, and place the hunting rifle far ahead of where it is now. B.

BELLOWS FALLS, Vt.

Editor Forest and Stream:

In my own experience with a hunting rifle, ninety-nine one-hundreths of all of the misses have been occasioned by lack of flatness of trajectory. Almost any one of the guns in the market shoot with sufficient accuracy, provided only your judgment of distances is correct, and the necessity for making a calculation every time you shoot is to my mind the chief objection to all of the repeaters in the market, except, perhaps, the Winchester express. It is difficult to see how a .40-90-500 cartridge will improve the matter in that respect. It is true you will get with such a cartridge excellent penetration, but that does not necessarily mean a proportionately large amount of killing power, for after a ball has passed through the vitals of an animal its subsequent career is of very little importance to anybody. A large hole there is of much more value than a small one through the skin on the opposite side. For that reason a .45 government shell loaded as suggested by "Big Ingin," has always seemed to me to give most satisfactory results.

The 85 grains of powder and 300 grains of lead give a fairly flat trajectory and a penetration sufficient if placed anywhere except in the haunches, to reach the seat of life in any animal that the bulk of your readers will ever see. The gun out of which to shoot it is almost as hard to select as to reach a decision upon the cartridge and caliber. Repeaters are not without objections, and many men will not use them under any circumstances. On the other hand, in a tight corner, with a wounded bear within a few feet of you, the time which you have at your disposal to fish out a cartridge from your pocket or belt and stick it into your singleloader seems wonderfully short.

Personally, I compromised between the two systems by obtaining a Baker three-barrel, and so far have never had any reason to repent of the choice. The rifle is as accurate as any ordinary hunting arm, while the two 10-bore shot barrels loaded with a solid ball furnish an amount of offensive and defensive material at short range, very reassuring to the holder of it. Mine is somewhat heavily choked so that a 12-bore ball is as large as it is safe to use, but this, with five drams of powder back of it, strikes anywhere inside of the danger range with tremendous force. The accuracy of this round ball beyond fifty or sixty yards is nothing to be proud of, but inside of that distance it is good enough to answer every purpose, and you are in very little danger personally from any animal until he gets at least as near as that. For the more extended ranges you have the rifle barrel ready at your hands, and as efficient as any other. The gun will weigh inside of ten pounds, is well balanced and has no more chance of getting out of order and failing you when most wanted than an ordinary shotgun.

Probably the gun now made is not as good as the one some enterprising genius will eventually put on the market, but it seems to me that something constructed upon similar principles will be the coming gun. Any one who has seen no tougher an animal than a deer run half a mile with a .40-caliber ball clear through his body must realize that no ball of small bore can fill the bill unless it chances to reach exactly the right spot. I had the makers construct for me, to special order, 28-inch barrel, 10 or 12-bore for the shot and .45-caliber government shell. THREE-BARREL.

Editor Forest and Stream:

Has your correspondent, Mr. W. J. Dixon, ever given the Lyman patent rear sight a fair trial? If he has, and has one "for sale cheap," he can dispose of it readily by writing to me. If he has not, then before tying to plain open sights, let him try one.

I cannot think that any hunter, unless prejudiced against all "new-fangled" things, would fail to appreciate the Lyman, if once tried.

I know from experience that sight on a moving object can be caught quicker and easier with it than with open sights, for, after a little use, all you have to do is to put your front sight on the target in the right place, the eye finding the aperture in the disc without any voluntary effort. Another point in its favor is that it is readily adjusted for elevation. This of course amounts to but little at the ordinary hunting distances, but one frequently risks a long shot at game rather than to have no shot. With this sight your only mistake can be in estimating the distance, for a little practice on the range over known distances will give you correct readings on the graduated stem.

I agree with "Moro" in his opinion of the usefulness of a .25-caliber rifle for those who hunt small game, but not in thinking a ramrod should be under the barrel. I can see no use for it, as it will make the rifle heavier, clumsier, and give the user more trouble in keeping clean. I don't believe that "Moro" or any one else would ever wish to load a rifle of this size from the muzzle, for if one is brought out that equals in shooting qualities the best .22-caliber barrels of today, no fault can be found with its accuracy, and it is certainly not more convenient to load from the muzzle. In cleaning, I claim that a metal rod should never be used if one admires the polished grooves and bands as I do. In theory a brass rod will not injure them, but in practice one can.

A rod of wood (lancewood) is best, can be so jointed as to bring no metallic surface in contact with the barrel, and is easy enough to carry in the pocket. MAX.

HOPEDALE, Mass.

I would like very much to ask through the FOREST AND STREAM if any one has tried a Colt's .45-caliber 260-grain ball in the government cartridge in any rifle? Would not the Colt's 260 and the Smith & Wesson .41 revolver ball give in the government cartridge a proportion of 1 to 3?

CLARENCE J. NORTON.

MORANTOWN, Kan.

Editor Forest and Stream:

Why is the breech mechanism of rifles not made in the same way as that of shotguns. Shotguns are certainly more convenient to manipulate, and with few exceptions, there is very little difference in the manner of connecting the barrels. The latest development of the shotgun would perhaps be very desirable in a rifle. F. H. B.

NEW JERSEY.

[Rifles require greater strength at the breech than could be secured by shotgun breech mechanism.]

Editor Forest and Stream:

Without discussing the advantages of a breechloader, I don't believe any system of rifles has equalled the one-ounce round ball of the muzzleloader either for accuracy or bone-crushing power. It has frequently happened that the hunter's life depended on planting his ball in an exact center. As he would raise the rifle to his face, his mental comment was: "God bless the old gun, she has never failed me heretofore, and will not now." FORTY-NINER.

Editor Forest and Stream:

Should not the variety of game to which a rifle may be readily adapted largely constitute its merits for sporting purposes? Whether repeating or single, my own choice would be the gun with which I could kill anything, from a grizzly down to a squirrel, and with which I could use the amount of powder and lead desirable for each purpose. Such a combination seems quite possible to me. Cannot the .40-90 be made to use, with accuracy, not only a 500-grain bullet, were it ever desirable, but one of 300 grains, or less, giving the necessary low trajectory of the express, and also a ball—I mean a round bullet—with either large or small charge of powder, the light charge to be used in shooting off the heads of such small game as it is often very desirable to have in camp? Of course accuracy in all cases may be regarded as indispensable, but particularly with the light charge should it be such that missing the head of a squirrel or grouse could not be attributed to the gun. In using the smaller amount of powder, would it do to push the round bullet down the shell to the powder, or should the space above the powder be filled, in a measure, with some kind of wadding, or a tube of wood or other material be placed in the bottom of the shell? The sights for such a gun would need to be readily adjustable to suit the various charges; but after all it might be found that the sight required for the 300-grain bullet would answer also for the round bullet with reduced charge of powder; in which case not more than one variation of the sight would be necessary. As the sights of a hunting rifle are an important item, it would be interesting in connection with other considerations to have them discussed and definitely described. If the above requirements for a rifle are attainable, and with them is combined a construction affording the greatest facility for changing from one cartridge to another, a construction which is safe, simple, symmetrical and handy, is it not very nearly the hunter's ideal? J. G. D.

Editor Forest and Stream:

As far as the rifle is concerned a man must be very hard to satisfy who cannot be suited with one of the many excellent guns now in the market. It is simply a matter of taste, they are every one good, whether single shot or magazine. I have had a good deal of experience with both kinds, and I have no further need for a magazine gun. That is only my idea, many others of my acquaintance think just the opposite. Still, this discussion is not upon the guns but upon the ammunition. More powder is called for, I agree with every man who has expressed his views. I shoot a .40-60-270 cartridge now with great satisfaction, but I am going to have my gun bored for a .40-100-270 cartridge. I think .40-caliber as near right as it can be fixed for all game with the one exception of the grizzly bear; when you hunt him you want a Gatling machine gun, or what is better—don't hunt him. A 270-grain bullet is efficient, and will give sufficient shock if properly placed for all practical purposes. SAXET.

GAME IN IDAHO.

Editor Forest and Stream:

Noticing that you receive very few communications from Idaho, I take the liberty to send you a few notes from letters received from a friend located in that Territory near Rocky Bar. He writes: "You hint that you may take a 'hunt that is a hunt' in the near future. Can't you come out into these mountains? I will furnish you with camp outfit, etc., and guarantee you great sport. Deer and grouse never were as plenty in these parts. Caused no doubt by the stampede into the Wood River country, driving the game into the mountains east of us. There are no mines in a section of the country about thirty miles square to the eastward, and the game is very thick. Eight miles from here several two-year-old cattle have been killed by a bear. This 'old cuss' is known as a bald-faced grizzly, and tracks are found ten by sixteen inches. Is that the kind of game you want?

"Two of the boys went from camp on a little hunt before Christmas, as we needed some fresh meat. They killed nine deer, and got them within sixteen miles of camp. They were unable to pack them in and had to leave the deer, sledge, etc., on account of the snow being so deep (four feet). I sent word to the ranchmen on Boise River to help themselves, so the game will not be wasted. One party on Big Camas killed seventy-five deer. The boys say they were in droves of one hundred or more. Since the Indian hostilities they have increased rapidly; but I think the railroad passing down on the sage plains will have a tendency to check their assembling.

"I only wish you could be here in October or November and have some sport—it would beat your fishing trips to Northern Michigan. If you wanted fish, however, we could accommodate you. Two to three pound trout are very plenty in the streams below us. Come and get some."

PRAIRIE DOG.

A HINT ON ETIQUETTE.

Editor Forest and Stream:

Although January was a cold month, taken altogether, yet there were not over two or three bitter cold days in any one week; and after every heavy snow there would be a warm rain which would wash off several inches of the snow, and in that way the partridges (*Ortyx virginianus*) were not deprived of food to any damaging extent; and none of the cold snaps lasted long enough to freeze any of the game.

Partridges were more abundant last fall in Virginia than for several seasons previously, but I apprehend none of the young shots will ever see them in such numbers as they used to be before the war, or as they were from '65 to '72. Hares (not rabbits) were very plentiful last fall. Turkeys have been raising in our mountains for several years, and now and then I hear of the shooting of one or two. If ever a huntsman kills one, the fact is sure to be announced in the local papers.

A majority of the land-holders, who are not huntsmen themselves, look upon a huntsman as a nuisance; and so very few of them care anything for the protection of game. And sometimes Northern gentlemen will come to Virginia and partake of a gentleman's hospitality for a week or fortnight, and send every bird they kill to the North by express. We think it is the correct thing for a gentleman to offer to the lady of the house as many birds as she may pick out during his stay under her roof. OLD HARE.

ALBEMARLE COUNTY, Virginia, February, 1884.

FOOLISH AND DANGEROUS.—The Springfield *Republican* reports: "An event of considerable interest occurred in the chemical department of Amherst College Saturday. Once in three years the experiment is made of condensing carbonic dioxide. So difficult and dangerous is the undertaking by this process that it is forbidden by law in all countries except the United States, and probably Amherst is the only college where it is undertaken. Two iron cylinders are used, one the generator, the other the receiver. They resemble howitzers, fitted with strong iron bands and peculiar valves. Bicarbonate of soda and sulphuric acid are placed in the generator in such a way as not to mingle until the cylinder is securely closed. The union of the substances generates carbonic acid gas with terrific pressure (being about a ton to every four square inches), and this passes into the receiver, which is packed in ice and salt. The process is repeated twelve times, until the gas in the receiver is forced by pressure and cold into liquid form. When this is allowed to flow out it evaporates so rapidly that it forms a solid, snow-like mass, having the surprising temperature of 140 degrees below zero. Mercury poured upon it freezes instantly, and the effect of touching it is about the same as handling a red hot coal. The great danger in the experiment arises from the tremendous pressure—and thus the liability of a bursting cylinder. The experiment Saturday, which was in charge of Instructor Pond and the senior chemistry division, was of great interest to the entire college.

REVOLVERS FOR GAME SHOOTING.—My experience with revolvers has been very much like "W. F. C.'s," but I am of the opinion that the remedy lies not in making them with different sights, but in placing enough metal in them. I believe that good shooting could be done with a .22-caliber revolver of the same size, shape and weight of the .32-caliber S. & W. as now made, and it could be sighted full on the object fired at. I have owned many revolvers of most approved makes, but never yet saw the rabbit that had any just cause to be "skeered" of me as long as he could keep fifteen paces from me.—MAX.

A correspondent, "E. B. B.," writing from Vail, Iowa, says: My experience in pistol shooting is very similar to that of "W. F. C." I found one make of pistols among the dozens I have tried that shot accurately without resighting. It is a small single-shot, .22-caliber, called Remington's vest pocket pistol. I have made some remarkable shots with them. I remember on one occasion when two of the boys were shooting at a postal card with a navy revolver. The card was pinned on a wide board, distance seventy yards; they were missing the board when I came up; so thinking I could do no less, I took a shot with my Remington, striking the card very close to the center. I was invited to shoot again, but declined.

WINTER NOTES FROM TENNESSEE.—Grand View, Tenn., Feb. 8.—The Sunny South for once has experienced a cold wave. January has been unusually cold and raw. Snow fell about six inches deep, and remained some ten days, which made it a little rough on quail; but I believe they came through all right. I have a small spring branch bordering one side of my wood lot, which is close to the house, and along this branch is a thicket of small brush, also a rank growth of weeds, many of which are seed-bearing. Into this the quail gathered in quite large numbers, where they were completely protected from the storm. My wood lot covers about ten acres, and in it are hatched some half dozen or more broods every summer. The weather is warm and springlike now, and at this present writing I can see a flock of more than twenty quail among the hens, within six rods of my door. Our house cat would no more catch a quail than it would one of our chickens, neither would it disturb the small birds which my wife fed during the snow-storm last month. However, I would not vouch for the honesty of any house cat if it was far from home, or short of food. The bluebirds and robins are plenty now; the former remains here through the year, but the latter is seldom seen here during the summer.—ANTLER.

A BEAR HUNTING DEVICE.—Elk Rapids, Mich.—*Editor Forest and Stream:* Mr. J. B. Squibob, a veteran bear slayer of Elk Rapids, Mich., has recently devised (in conjunction with Dr. E. C. C. Kellogg) a combination-gun-lather-and-sticking-plaster, for capturing bears dead or alive. The gun, a double-barreled breech-and-muzzle-loader, is baited, set and hung up in a tree. Then the trunk of the tree is greased with the slippery mixture and the sticky stuff is spread around on the ground. If the bear succeeds in climbing the tree the gun is discharged and bruin drops dead. If he slips down the trunk, he must stick fast in the patent sticking. Mr. Squibob claims to have known Major Verity, of Adironda, who sometimes writes to you. The bear device will, it is hoped, be put on the market next season.—MOSS BACK.

OSWEGO, N. Y.—A large number of whistlers are wintering in the Oswego River, near Battle Island. Some of the members of the Leatherstocking Club have been paying considerable attention to them; O. S. Osterhout, the president, bagged fifteen one afternoon recently.—DAN.

THE HAMMERLESS IN DEMAND.—*Editor Forest and Stream:* A year ago, if any one had told me that at this time I would want a hammerless shotgun I should have smilingly responded "I guess not." At that time I considered a gun without external hammers a good deal like a cow without horns; somewhat of a freak. But opinions change, and after having hammers slip from cold thumbs while cocking in the field, spoiling one or two canvas cases by the chafing of hammers, barking one's knuckles on hammers, getting whistle cord and watch chain snarled up with the same, and last but not least, seeing a man killed by slipping the butt of his gun off from a door step and striking the hammers, thereby discharging the piece into his breast, I have come to the conclusion that the best place for the hammers is inside of the gun.—DORKIN.

MAINE INDICTMENTS.—Indictments were found by the Grand Jury, February term, against Jeremiah Lynch, having partridges in his possession in close time; George Trafton, Frank Gould and John Spearing, attempting to kill salmon by dynamite; George Trafton, Frank Gould, John Spearing, Clarence Peavey and Frank Cram, of Sherman, fishing with net in waters not tide waters; J. T. Richards, having trout in his possession in close time; James Dunn, killing deer; Joseph Gillespie and Lovell Weymouth, hunting deer with dogs; Benjamin York, killing caribou; Charles Spearing, hunting deer with dogs.

CATAWISSA, Pa., Feb. 16.—A number of our sportsmen here have been very active during the past severe winter in caring for the quail in this vicinity. They have also succeeded in getting some of our farmers to take an interest in the welfare of the birds. They have now about one hundred quail which they have brought through safely by giving them protection from the deep snows, and providing feed for them. These gentlemen certainly deserve great credit for what they have done.—E.

FRANKFORD GUN CLUB.—A new club has been organized in Frankford, Philadelphia, to be known as the "Frankford Gun Club." Object: Improvement in wing-shooting. The officers are: President, Henry Winnemore; Vice-President, Henry Longhead; Secretary, R. H. Mellor; Field Captain, Alonzo Tolbert. Secretary's address, R. H. MELLOR, 309 E. Orthodox street, Frankford, Philadelphia, Pa.

GOOD GROUND.—Long Island, Feb. 23.—There are plenty of ducks in Shinnecock Bay; it is estimated to be one hundred thousand by natives. All redheads and broadbills, and still coming by the thousands daily.—WILLIAM N. LANE.

MICHIGAN.—Escanaba.—A few deer are wintering about here, but there are as many wolves as deer. No one kills the wolves, as there is no bounty on them. This, I think, is a great mistake.—A. F. Y.

QUAIL IN IOWA.—Vail, Feb. 18.—We are having very little snow in this vicinity so far this winter, and the quail are doing nicely.—E. B. B.

Sea and River Fishing.

PRIVATE PONDS OUT OF SEASON.

IN New Hampshire the question has been set at rest whether an owner of a private pond, not communicating with public waters, may take fish from it out of season. In that State he may. In the suit of the State against Roberts the indictment was set aside.

The Court said: "The right to have migratory fish pass in their accustomed course up and down rivers and streams is a public right, which may be regulated and protected by the Legislature, and so far as the waters of this State are common passage ways for fish, they are of a public character and subject to legislative control. The taking and killing of certain kinds of fish and game at certain seasons of the year tend to the destruction of the privilege by the destruction consequent upon the unrestrained exercise of the right. This is regarded as injurious to the community, and therefore it is within the authority of the Legislature to impose restrictions and limitations upon the time and manner of taking fish and game considered valuable as articles of food or merchandise. For this purpose fish and game laws are enacted. The power to enact such laws was exercised previous to the adoption of the constitution, and it has been so long used, and so beneficially for the public, that it ought not now to be called in question. But while the Legislature has power to regulate and limit the time and manner of taking fish in waters which are public breeding places or passage ways for fish, it has not assumed to interfere with the privileges of the owners of private ponds having no communication through which fish are accustomed to pass to other waters. Such ponds, whether natural or artificial, are regarded as private property, and the owners may take fish therefrom whenever they choose without restraint from any legislative enactment, since the exercise of this right in no way interferes with the rights of others. The Legislature protects the owners of such ponds in the enjoyment of their privileges, and they are expressly excepted from the statutory restrictions by the third section of the act upon which the indictment in this case is founded. The defendant is in possession, claiming the ownership of North Pond. There is no suggestion that the public have any rights in its waters other than as a breeding-place for the supply of fish to other streams, or a channel for their passage. If, as the defendant claims, the trout are within his control, and there is no communication through which they can pass from the pond to other waters, the indictment cannot be maintained. If, as is claimed in behalf of the State, there is free communication through which trout pass from the pond to the streams leading into it and to the Ammonoosuc River, the indictment can be maintained upon proof of those facts."

I am not aware that this point has been settled in the State of New York. Query: If the owner of a pond, the source of stream, keep wire across the outlet so no fish can pass out, has he the control and possession spoken of in the foregoing decision, which will allow him to catch fish out of season? I think I know one thing that will result from such a wire dam, and that is that, if a trout stream and trout pond, the fish not being able to run up from the stream into the pond to spawn, the fish in the latter will first grow very large from over-feeding, and will then steadily diminish in numbers from not being reinforced annually in the natural way from the stream.

"There is that scattereth and yet increaseth, and there is that withholdeth more than is meet, but it tendeth to poverty."

A very nice point has been suggested by Mr. Roe, of Roe & Macklin, of this city, whether the placing of fish from a public hatchery in any part of a stream would not give a public right of fishery in all parts of that stream, no matter if a long piece of it were privately owned and preserved, because the fish would spread from the part where they are put in; and that New Hampshire decision would seem indirectly to sustain this view. For myself, I do not think the right of the distant owner could be so affected without his knowledge and consent. Mr. Roe is a famous lawyer, however, and a good disciple, who annually makes a pilgrimage to the Neversink. GEO. W. VAN SICLEN.

NEW YORK, Feb. 11, 1884.

A PENNSYLVANIA CASE.

Editor Forest and Stream:

In a letter to your journal from this city, under date of Jan. 21, the writer refers to large bunches of quail, grouse and rabbits as being exposed for sale in our market, which he says were evidently killed after Jan. 1, in which case it would be a violation of the law. The letter also refers to the Lycoming Sportsmen's Association, and asks whether the city has any game wardens. The organization still exists, and its object is (or was) for the more rigid enforcement of the game and fish laws in this locality. It is in a healthy condition and numbers upward of one hundred members. An executive committee is elected each year, and it is the duty of each member of this committee to report any violation of the law that they may see, or that may be reported to them, and prosecute the offenders if the case is strong enough to warrant it. Each member of this committee may properly be called a game warden. Until within the past year our club has manifested considerable interest in the enforcement of the game and fish laws and the protection of game and fish. The cases prosecuted by us were from an honest standpoint, and the spirit is still in us to continue the work; but in the last undertaking we were so decidedly "sat down upon" that our members have become discouraged, and at present are not as active as they otherwise would have been. The case in question will define our position.

We arrested parties for seining, which we thought was contrary to the act of Assembly, which reads: "No person shall draw a drag net or seine in any of the waters of this commonwealth." The waters in which the seine was drawn was a mill-pond which is fed by a canal, and the canal by the Susquehanna River, and the fish have free access to all the waters named. The defense was, that the mill-pond was private property, and the defendants had permission from a part owner to seine. Our view of the case was that the pond was not owned in its entirety by the party granting the permission, and the fact of the fish not being confined made them common property, and the law had therefore been violated. The case was heard by an alderman, both sides being represented by counsel, and a judgment given in our favor, the alderman basing his decision on a decision of the Supreme Court in a parallel case, which is as follows:

Pennsylvania State Reports (12 Norris, p. 458, etc.)—"If the waters of a pond cover a large surface of land, and one whose lands are covered by a part only of the water, places fish therein for the purpose of propagation, it does not thereby became a private pond. To bring it within the act of 1876, the whole pond must be so far private property as to confine therein the fish with which it is stocked; the ownership of a part only of the land covered by the water is not sufficient to give to the whole water the distinctive character of private, the pond must be treated as an entirety, either the whole or none is private."

The case was appealed. At the term of court in which it was to be tried, the judge, in his charge to the Grand Jury, alluded to it, and his remarks were in substance about as follows: "The defendants had just as much right to seine and take fish from that pond under the circumstances as a farmer would have to take his cattle from the pasture field." Upon the strength of these remarks, we presume, the Grand Jury ignored the bill of indictment, and the costs, amounting to some $75, were put upon the prosecutors. We were somewhat surprised to find our labor disposed of in this manner, for we took the precaution to consult several of our most prominent attorneys before commencing the action, and they all said our case was a very plain one. When this seining was done quite a number of black bass were caught, and we could have brought another action under the same law, but our protection not being assured, we concluded to give the matter the go by.

The quail, grouse and rabbits referred to were exposed for sale right in front of the entrance to our club room, and many of our members spoke about the law in the matter, but none seemed to have any inclination to make an investigation for the reason of our failure in what appeared to be a plain case. I very much doubt whether a single piece of the game was killed in this locality, or in this State, but rather think it was the production of other States, and in that case I do not believe the laws of Pennsylvania would be affected.

A MEMBER OF THE LYCOMING SPORTSMEN'S CLUB.
WILLIAMSPORT, Pa., Feb. 13, 1884.

THE BEST COLOR FOR LEADERS.

Editor Forest and Stream:

Nothing has appeared of late in the FOREST AND STREAM which I appreciated more highly than Mr. Wells's article on the "Best Color for Leaders." And now, in furtherance of the idea of "looking at the leader from beneath the water," I have an idea which I can't better illustrate than by giving a bit of experience. Near us we have a stream in which the fish—trout—are scarce and wild. They are exceedingly suspicious of any kind of tackle. Is not such water the very place to test my tackle? I had repeatedly cast the most tempting flies, with a mist-colored leader, without effect. A soliloquy followed: "That leader is not natural to the water nor to the every-day life of the fish." I adjourned to a neighboring meadow and cut three or four long, leafy timothy stalks, which I very loosely whipped on my leader. There was no casting, but simply letting the line float with the current over the most likely places. Complete success was my reward.

Mr. Wells's article bothers me in one particular. "The best trout, etc., can't pull one pound on a flexible rod," and the big, muscular man, only 1¼ pounds. According to that, if we were to hook a "real live elephant," he would only strain the tackle to the extent of about 9.006 pounds. Is there a strain of only a pound, or a little more, on the line when a salmon leads a skiff all over a little lake? There may be a clear explanation, but I am fearfully in the fog.

FORTY-NINER.

The communication of "Forty-Niner" having been referred to Mr. Wells, that gentleman has favored us with the following comments upon it:

Editor Forest and Stream:

The communication of "Forty-Niner" has been received, and read as requested.

In regard to the first paragraph, it is to be wished that all anglers would follow this most excellent example and print any unusual experience. You have provided a column for that express purpose, and it is a great pity it is not more used. After a while some enthusiast would collate, compare and publish these scattered facts, and a decided advance in the art would result.

To me this paragraph is second in interest to no angling intelligence I have met for a long time. It tends strongly to confirm an idea forced on me by my own investigations, but in regard to which, from dislike to hasty conclusions drawn from insufficient data, I had decided to say nothing until the weather permitted the test of further experiment.

I am inclined to believe that more important than fishing up or down stream, more important than wearing brilliant or sober-tinted clothing, more important than wading rather than fishing from the bank, more important than a dry or a wet fly, more important than being yourself visible or concealed, more important, indeed, than any of the dozen different cautions of the books, is it to have your leader absolutely invisible, or, if that is impossible, then at least that it present to the trout no unusual or unfamiliar appearance.

That, in or on smooth water, the leaders in present use fill neither of these conditions, unless my experiments deceive me, I cannot doubt. Whether it is possible to make a leader which will always comply with either of them is another question. Certainly the first step toward supplying a want is to recognize its existence. "Forty-Niner's" leader, prepared as described, did comply with one of these conditions, and the "complete success" which attended its use is very instructive "to all who are willing to be admonished."

The statement that "the best trout, etc., can't pull one pound on a flexible rod" seems to stagger Mr. "Forty-Niner." It would not be difficult to answer, on theoretical grounds, the objections he so considerately suggests, rather than asserts. But no theory has the convincing power of direct experiment. Let him try it for himself.

If he will take a single-handed flexible rod, run the line through the rings and about three feet beyond the tip, tie a loop in the end of the line, hook a spring balance into that loop, get a friend to hold the spring balance down close to the floor and follow up with it the natural bend the rod will assume and the direction of the line, always holding the balance close to the floor; and if he will at the same time take the rod in one hand, with the butt clear of the body, and put on all the strain he possibly can, when his friend reads off the indications of the spring balance, he will then be in position to compare the strain he has exerted with the severest pull a trout has ever imposed on him; and then he can and will draw his own conclusions as to the truth or falsity of that statement. HENRY P. WELLS.

NEW YORK CITY, Feb. 25.

[Page 70, fourth paragraph from end of Mr. Wells's article, for "us" read we.]

THE STATE IN SCHUYLKILL.

IN his "Chronicle of the Compleat Angler," Mr. Thomas Satchell writes as follows of the famous Philadelphia Angling Club:

He was preceded, in 1830, by an anonymous author, whose work has become a rarity, even in its birthplace, while only one or two copies have found their way to our shores. It is entitled "An Authentic Historical Memoir of the Schuylkill Fishing Company, of the State of Schuylkill, from its establishment on that romantic stream, near Philadelphia, in the year 1732 to the present time. By a Member."* We lay no claim to literary value in relation to this tract, but as it has the signal merit of giving us an insight into what angling life in America was a century and a half ago, it cannot fail to be of interest to all Waltonians. We have, therefore, not to excuse a brief digression on its behalf.

In that year of grace, 1732, Philadelphia was the center of an infant colony, a colony struggling up, indeed, into strength and stability, but with a world of work on all hands, still left to be achieved, ere the rough, primitive forms of the settlement could be mellowed into order and harmony. Toil and turmoil must, therefore, have been the order of the day, and leisure and recreation mere remote contingencies. From this point of view, it is nothing short of a marvel that, at the date just cited, certain contemplative citizens of the new capital did actually establish this fishing club, or company, and set it going, with a governor at its head, five assembly men, a treasurer, sheriff, eighteen associates and the lugubrious appendage of a "coroner." Several of the projectors of the club had come over with Penn from England, and had been fellow workers with him in his colonial scheme; and it is but reasonable to suppose that an affectionate memory of the old land they had left forever, and of happy youthful days spent, angle in hand, beside its lakes and watercourses, lay at the root of their proceeding. If so, they must have been met by many points of divergence. Instead of wending to their sport through the grassy English meadows of "auld lang syne," their path lay through the uncleared wilderness, which, at the period in question, overshadowed the very walls of the town, and from that center stretched out west, north and south, in limitless expansion. Instead of speckled trout and silver grayling, they had to fill their creek with lumbering "catfish," or at best, with "white perch." And instead of partaking, when their sport was over, of smoking sirloin, or venison pastry, flanked with creamy ale, or sack-posset, they were regaled on "rock and gray squirrel," with a thin accompaniment of lemonade. "Punch and pipes," and occasionally a "barbacued pig," are the only English-sounding adjuncts of their repasts. It is but fair to add, however, that the club grew proud of their white perch in the course of time, and that some American anglers of the present day laud it above the trout.†

Having obtained the grant of about an acre of land on a

*"An Authentic Historical Memoir of the Schuylkill Fishing Company of the State in Schuylkill, from its establishment on that romantic stream, near Philadelphia, in the year 1732 to the present time. By a Member [William Milner, Junr.].

"If you look to its *antiquity*, it is most ancient,—
If to its *dignity*, most honourable,—
If to its *jurisdiction*, it is most extensive.

Philadelphia: Judah Dobson. 1830."
Collation: pp. viii. 127. ii.

†It is the small white bass, or *Lebrax pallidus* of De Kay.

wooded rise above the stream, they took possession of it, styled it magniloquently "The State in Schuylkill," and erected on it a wooden tenement (the "Castle") for their periodical meetings and festive gatherings. Here they are said to have passed a treaty with the chiefs of the Leni-Lenape, or Delaware Indians, who granted to them and their descendants for ever the right and privilege to hunt the woods and fish the waters of the Schuylkill.

The early records of the company are, unfortunately, but few and incomplete. Pen-craft is not among the primal growths of a colony, and the mantle of our Izaak seems to have been far from falling on any one of the fraternity, and certainly not on him who, a century after its foundation, compiled the memoir in question. For we are compelled to avow of this "member," that though parcel facetious, parcel flowery, parcel bacchanalian, he is *passim* illiterate and feeble. His orthography halts, his syntax has a frequent analogy with that of "Shrewsbury Barker," cook and piscator, who he refers to as "T. Barker, *Esquire*." This is a disappointing fact; for, in skillful hands, the theme might have been woven into a very charming chronicle, rich in quaint glimpses of early colonial life, and presenting the angler's sport to us in startling and unfamiliar aspects.

When the War of Independence broke out, several of the Schuylkill fishermen took up arms in the good cause, with honor to themselves and their association, but returned (such as were spared), when the strife was at an end, to their pensive pastime and their beloved white perch with undiminished ardor. There must have been grand talks under the castle walnut trees, in the long summer twilights, when these glorious absentees came back to their haunts, and unusual must have been the demand for "punch and pipes," while they "fought their battles o'er again," for the benefit of their less favored gossips. One need not be Fine-ear to catch, even now, the rattle of the assault, the thunder of the climax, and Schuylkill murmuring in the pauses, among its rocks and rapids.

In the ninetieth year of its existence our company had to draw its stakes and move further afield. A dam, built across the stream in their immediate neighborhood, frustrated the sport by keeping the fish from their feeding grounds.

Another site having been selected, the castle was pulled to pieces, packed in a boat, and conveyed, with all the company's heirlooms and household gods, its "mammoth punch bowl," its "Mandarin hats," its "great pewter plates," "Governor Morris's frying pan," and "the banner of the Stripes and Stars," to its new destination. There foundations of stone were laid for it, and the "Hall of Congress" soon reared its head once more with renovated splendor. We say this from the Schuylkillian point of view, for a sketch of the building, figuring as a frontispiece, we took at first, we confess, to be a "little Bethel." A description, however, underneath set us right. The carpenter who executed this wooden exodus received, we are told, a vote of thanks and the liberty of the State for a year.

It was in their new location in 1825 that one of the most exciting incidents of their history occurred, in the shape of a visit from the famous General la Fayette, then on a tour through the provinces of America; while, in 1787, the company had received the still greater honor of a visit from General Washington, but no record of that interesting ceremony has been preserved.

It will have been seen from the foregoing that sport in the Schuylkill possessed but little variety; catfish and white perch seem, indeed, to have formed the staple of it, though shad, sturgeon and drumfish were sometimes taken. The latter (*Pogonias cromis*) having been recommended as a substitute for rockfish, was experimented on by the company; but, though "richly dressed in the lobster style," it turned out "as tough as a drumhead," and was eschewed thenceforth. On a solitary occasion a trout was captured ("on a lay-out line, by Mr. Benjamin Scull") that measured fifteen inches. Mr. Scull was dubbed "the prince of fishermen" in consequence, and the event was marked with a white stone, but found no parallel.

Here our retrospection of this curious book may terminate. A hundred and fifty-one years, as we have said, have elapsed since the Association was founded; modern improvements have greatly altered the character of the river, blasted its rocks, changed its levels, and converted it from a brawling impetuous torrent, into a purling and peaceable stream, but still the Schuylkill Company lives and prospers (Dr. Bethune is our sponsor for this assertion), and still above the words rises the glittering vane of its Hall of Congress. Remembering, then, that this American Angling Association is the oldest in the world—that the Walton and Cotton Club is infantine compared with it—that, as its motto declares—

"If we look to its antiquity, it is most ancient;
If to its dignity, it is most honorable;"

we may well doff our hats to it, in a passing but reverent greeting, *Salve, Magister!*

[An illustrated sketch of "The State in Schuylkill" was recently printed in the *Century Magazine*.]

BIG STURGEON.—I have several times read of sturgeon weighing one hundred pounds and called big. "Verax," in a recent issue of FOREST AND STREAM, tells us about boating eleven sturgeon in a yawlboat. We (on the Delaware) call a five hundred-pound sturgeon a big one. "Verax" landed his fish over the bow. We boat ours over the stern. We catch them with a net and raise the net where the fish is. We raise it in the same way you would a crab line, and as soon as his head comes up, hook him back of the fin or about three inches back of the eye. After being hooked, the net is taken off of his head and another hook is driven into him in the same way, his head is raised on the stern, and by a quick jerk and with a pull he is landed in the boat. Will "Verax" please tell us what the sturgeon were doing on the lines? Were they hooked? And what kind of a hook was it? What do they bait with? And why he did not boat them with the line they were fast to without the use of a gaff hook? I ask this for information, never having heard of a sturgeon being caught in that way.—CLAYTON VON CULIN. [See account of taking a sturgeon on a line in the note on "Smelt Fishing."]

THE VETERANS CALLED ON.—*Editor Forest and Stream:* I am very much pleased with the practical hints in the Fishing Department of the last two numbers of FOREST AND STREAM, for I am a year-old infant in the trouting way, and must use the experience of others until I can accumulate a little of my own. I indorse "Couples's" remarks in the last number, and hope to see the Fishing column as practical as Gun and Canoe columns are. Can't some of the old hands help us along a little? We will be respectful and thankful. —F. M. C.

A KINGFISHER LOST HIS DINNER.—Chatham, N. Y.—I had been fishing down stream (casting my flies with quite good results for me, having twelve or fifteen nice trout in my basket) when a look at the sun warned me to retrace my steps in order to have the twilight fishing in a few favorite places. I thought I would make just one more cast in a little pool, shaded by a low willow, a few rods below the bridge on which I was standing. As I cleared the fence I heard the shrill screech of the kingfisher, and a moment later he darted like an arrow from a limb of the willow into the pool. For a few seconds it seemed as if he had gone to stay (and I wish he had and taken the rest of his tribe with him, especially those who infest our trout streams). He soon, however, came to the surface, and for a little time it was hard to tell which would have the best of it, the bird or the trout. The bird, however, soon cleared his wings from the water and rose from the brook with nearly a four-ounce trout in his murderous beak. My first impulse was to get square with the kingfisher for spoiling my cast in that pool, and for spearing the trout which I anticipated taking in an honorable and legitimate way a few moments later on my red hackle. So, waiting till he was clear of the brook, then throwing up my arms gave a yell which, in order to answer, the bird was obliged to open his beak, and out dropped the trout on the bank, which I leisurely proceeded to place with the others, which had been procured with more labor, but with the enjoyment which can only be felt by the angler with an eight or ten-ounce rod in hand and a good-sized trout tugging away at the end of thirty-five or forty feet of line.—DEL.

SMALL FLIES.—Roslyn, L. I., Feb. 18.—When only a boy, I passed some months of my life among the hills of Craven, Yorkshire, England. It was then and there that I was taught fly-fishing for trout by my grandfather, and my present reason for dropping you this line is that last evening while examining my fishing tackle I chanced upon one of the English flies, and material for leaders such as I then used. Inclosed herewith you will find them, and will see that the leader is of a single fine horse hair, while the fly is no more than one-third the size of those used by most of my trouting friends here. The specimens I send have been in my possession some thirty years, and are still equal to capturing a good-sized fish. I have used both flies and leaders precisely like those inclosed on my trout pond here, and find that the fish will rise to such fine tackle on a bright summer day when they will pay no attenton to the coarse American trouting outfits. Our American rods and reels cannot be excelled in delicacy, why then do we fish with clotheslines? Of course it needs a gentle hand to take a three-pound trout on a single horse hair, but then 'tis true sport, and I, for one, think that cod fishing should be confined to the smack and her crew.—THOMAS CLAPHAM. [We will try the little midge this spring. Thanks.]

SMELT FISHING.—Saco, Me., Feb. 18.—There are eighteen smelt shanties on the ice near this city, larger than the tents at Belfast, with boarded roof and sides, and furnished with stove, lamps and bunks, so the fisherman can sleep when the smelts do not bite. The fishing is done wholly at night. It is not a paying business, as there are weeks at a time when but very few are taken, and, when biting the best, five or six dozen is considered a large catch for one night. Last Tuesday night J. W. McCorrison caught a sturgeon on his smelt line that measured 3 feet 8 inches. It was hooked close to and just in front of the mouth, and drawn to the surface with the line, then by the use of a gaff it was landed on the shanty floor. The next night McCorrison caught on the same line a sucker, measuring 19 inches, and it is claimed here that it is the first fish of the kind ever taken through the ice.—W. F. CUMMINGS.

Fishculture.

HOW TO COOK CARP.

Editor Forest and Stream:

In your issue of Dec. 6 I notice some remarks as to the qualities and how to cook carp. Below please find a few receipts translated from a German cook-book. As a general rule the pond carp is not considered good to eat during the summer months, May, June, July, August (during and after spawning), but at all other times it is a most excellent table fish.

Receipt No. 1.

Clean a carp of about five pounds well, and split and cut it into convenient pieces. Take three tablespoonfuls salt, half a dozen kernels black pepper, same of allspice and cloves, a few cardamones, four laurel leaves, a medium-sized onion, some celery and a sliced carrot, and a quart of water (or enough to cover the carp); let these boil together fifteen minutes, put in the carp, scale side down, head pieces first, middle pieces next, tail pieces on top, and let boil fifteen minutes longer; add one-half pound butter in small pieces and a gill of red wine, or in place of wine pour one-half gill warm vinegar over the pieces of carp before putting them into the pot, and add it to the boiling. Boil fifteen minutes longer; take out the pieces and serve with browned butter and slices of lemon.

Receipt No. 2.

Clean and split a five-pound carp and rub two tablespoonsful salt well into both sides and let stand two hours in a covered dish. Take some spices and herbs as in No. 1, and boil thoroughly with one pint water, one pint red wine, one-half pint beer, one-half pint vinegar, some lemon peel, bread crust, and one ounce sugar. After this has well boiled, cut the carp in convenient pieces, put into the pot and boil till only about half the sauce is left, serve as before.

Receipt No. 3.

Clean a good sized carp carefully by opening it as little as possible, cut off fins and tail; make a number of crosscuts on one side, rub the fish well with two tablespoonsful salt, let it stand covered for some hours, then dry it with a towel. Make a filling of four ounces tallow or fresh fat pork, four yolks of eggs, some wheat bread slightly softened with water, three sardelles, some capers, mace, salt, pepper; lemon peel, onion, and the liver of the carp (but be sure that the gall is first carefully removed) all chopped very fine, fill the carp and sew up the opening. Put it into a baking dish with the cut side up with one pint wine, one-half pint vinegar, one-quarter pound butter, spices and herbs as in No. 1, and a few slices of lemon, bake quickly for three-quarter hours and baste frequently. Don't turn the fish while baking.

Receipt No. 4.

Take carp of one to two pounds, scale and clean well, rub inside and out with plenty of salt, let stand an hour or two, wipe dry with a towel, roll in well-beaten eggs and bread crumbs or meal and bake in plenty of butter till nicely brown.

Receipt No. 5.

Boil carp as in No. 1, place the pieces in a bowl with a few slices of lemon, add to the sauce one-half pint vinegar and boil same till only enough left to cover the carp in the bowl. Pour the sauce over the carp through a sieve and let it cool thoroughly.

I tried receipt No. 1 on bass and found them excellent.

C. C.

WEBSTER, MASS., Dec. 10, 1883.

WHAT FISHCULTURE HAS FIRST TO ACCOMPLISH.

BY CHAS. W. SMILEY.

A GENERAL impression prevails that fishculture proposes to immediately fill our streams with fish, to such an extent that the supply will be practically inexhaustible. In order to show that this is a very extravagant expectation, attention is called to the following facts:

Any tract of country needs to be but sparsely populated in order that its inhabitants may soon exhaust it of desirable food fishes. The native powers of the fish for reproduction and growth are not sufficient to withstand the inroads of man, when added, to any considerable extent, to the natural enemies with which they are surrounded. Very early in the history of the United States, its leading rivers were mostly depopulated of the best fish. A hundred years ago nearly all the streams of New York which emptied into the Great Lakes were visited annually by salmon in such enormous quantities that their numbers seem to us incredible. There are most authentic accounts which point to the water being fairly alive with them in many places, when seeking the upper waters of these streams for the purpose of spawning. It is well known also that the Connecticut, Hudson and Susquehanna rivers were at that early time visited by vast schools of shad, and the former, at least, by considerable quantities of salmon. Such a population as the Atlantic States contained seventy years ago was sufficient to exhaust these rivers of the more valuable food fishes, and before artificial fishculture was undertaken many streams had remained in this exhausted condition for a considerable length of time.

The first and great task of fishculture, therefore, is not so much to increase the number of edible fishes in any given stream as to withstand the enormous forces which are at work to produce their entire annihilation. As illustrative of this, the presence of shad in the Potomac River may be cited. For some years prior to the war of 1861-65, the shad fisheries of the Potomac had been practically exhausted. They had reached so low a limit that it was very unprofitable to fish the stream, and its barrenness helped to deter men from fishing; but the occupation of the banks of the river by hostile forces for the period of nearly four years made fishing practically impossible, and gave nature an opportunity to restore the fisheries. As a consequence, at the close of the war it was found that the river had been restocked to such an extent that the yield for a few years was very large indeed. The presence of large numbers of fish, however, called out the fishermen, and there was a steady decline, annually, in the yield, and, had it not been for artificial propagation, there would not be shad enough remaining in the river at present to warrant any fisherman in using a hundred-fathom seine. Fishculture, however, was brought in as a restorative. Each year since 1875 the United States Fish Commission has hatched and deposited from one million to ten millions, the numbers increasing annually. The principal result, however, has been to prevent annihilation rather than to cause considerable increase in the fisheries. The number of shad received at the Washington market annually for the past five years were as follows:

1879	311,585
1880	329,799
1881	321,368
1882	350,292
1883	284,474

In spite of the best efforts possible during these years the catch has declined. That for 1883 is smaller than might reasonably have been expected, because the temperatures of the river happened to be unusually low during the spawning season, and there is good reason to believe that many fish were diverted to other tributaries of the Chesapeake which would legitimately have come into the Potomac as a fruit of fishculture on that river.

The fish of our rivers have not only to contend with enemies within their water, such as a great variety of carnivorous fishes; the destruction of their eggs by numerous forms of aquatic animals; the injuries of abnormal temperature and sudden changes thereof, and the damage produced by sawdust, sewage, and other filth introduced into the rivers; but the agressive character of our citizens has told against the food fishes in increasing ratio annually. The increase of population produces a corresponding increase in the demand for these fishes, but the numerous facilities which modern inventions have brought to the aid of the fisherman in the way of wholesale appliances for capturing this kind of food complicate the question exceedingly. If fishing with rude appliances a hundred years ago was sufficient to exhaust a river of shad, what may be said of the ingenious traps and the miles of netting operated by horse power with which fish are met to-day? To successfully run the gauntlet of a series of nets, but a few rods or miles apart upon a considerable portion of the length of the river, and to elude the fisherman even on a flood-tide at midnight, has become practically impossible. Fishculture thus has all the natural disadvantages of a hundred years ago to contend with, and has the accumulated ingenuity of nineteen centuries to circumvent, in order even to maintain a decent supply of food fishes.

A striking example of the task of fishculture may be found at the Great Lakes. He would indeed be rash who would call upon the half-developed science of fishculture under existing circumstances to materially increase the supply of food fishes in the Great Lakes. Its mission is rather to try and keep the supply up to three-fourths, two-thirds, or even one-half of what these lakes formerly yielded. In 1871 there were 281 pound-nets being used in Lake Michigan, and 481 gill-nets. These appliances were sufficient to cause a continual decrease in the number of fish contained in these enormous bodies of water, and, fishculture aside, were sufficient to practically exterminate the fish in forty years. But in 1879 the 281 pound-nets had been replaced by 476 pounds-nets, and the 450 gill-nets by 24,599 gill-nets. Steam tugs devoted to fishing, scarcely used in 1871, numbered thirty in that lake in 1879. Furthermore, the larger fish of the lake having been caught, it became necessary to decrease the size of mesh of the nets, and to lengthen the nets, so that without doubt there have been for several years nets enough in use on Lake Michigan to reach entirely around the lake. Fishculture aside, and without any additional efficiency in apparatus, it is only a question of some ten years when the whitefish and trout fisheries will be entirely exhausted.

Fishculture is practically a science of the past fifteen years. It has not yet reached a stage of efficiency which can cope with any such state of affairs as present themselves on these Great Lakes. Even if five millions of dollars and fifty men are placed at the service of the State Fish Commissioners in the interest of fishculture, what are these in the contest with 50,000,000 of people demanding food, and millions upon millions of capital naturally drawn upon to supply their need. The fruits of fishculture, like bread thrown upon the water, must return after many days. It must wait the coming of the young fish to maturity before results are apparent. The fishermen, however, reap the fruit of their labors on the same day, if at all, and thus know the degree of success they are attaining at any hour. With them it is largely a question of muscle; they put down their nets and haul up their fish. With fishculture it is a serious question of scientific knowledge. It

has not professed to yet know many of the needed facts with referenc to the embryonic life of fishes, suitable temperatures of water, how to secure proper forms and kinds of food, etc. These are questions which must be solved by careful and continued study, and, while the past ten years have been all spent in this respect, there yet remains an enormous deal to be learned. It is as if all agricultural implements, all knowledge of seeds, soils, climate, and treatment of vegetables were blotted out of existence, and we had in ten or fifteen years to bring the science of agriculture from nothingness up to where it could supply the wants of 50,000,000, while but fifty or a hundred people were engaged in the effort and all the remainder of the 50,000,000 were arraigned practically in hostility to their efforts.

That, however, this citation of some of the difficulties of fishculture may not discourage any one from the enormous undertaking, I will close with citing one of the most remarkable of the successes thus far attained. The salmon canneries of the Sacramento River annually increased in number until by 1870 the entire run of salmon was being caught and utilized. The greatest natural capacity of the river under these circumstances may be considered to have been reached in 1875 when the yield to the canneries was 5,096,781 pounds. The first possible fruits of fishculture were in 1876, when the young of 1873 may be supposed to have returned. The United States hatchery was established in the latter year at Baird, Shasta county, Cal., and a half a million young released in 1873 and again in 1874. In 1875 the number was increased to 850,000, in 1876 to 1,500,000, and during each of the years 1877, 1878, 1879, 1880, 1881, two million young fry were placed in this river. From an annual catch of 5,000,000 pounds the river has come up to the annual catch of over 9,500,000 pounds, which figure has been maintained during the past four years. The figures were:

1880	10,837,000 pounds.
1881	9,600,000 "
1882	9,605,000 "
1883	9,586,000 "

Allowing the three years which it takes for salmon to come to maturity and enter the river for spawning purposes, the increase in yield to the canneries for ten years has been almost exactly proportionate to the increase in the disposition of fry. Taking into consideration the cost of hatching two million of salmon annually, and the value of the increase of 4,500,000 pounds, it will be seen that there is a very large per cent. of profit in artificial fishculture, when conducted under circumstances as favorable as these.

As illustrative of what present apparatus worked by skilled fishermen at the instance of very thickly settled regions will do, I will cite the Farmington River in Connecticut. Artificial hatching was carried on there for several years previous to 1879. That year it was discontinued. The catch was affected as follows:

1881, catch of shad	11,505
1882, catch of shad	3,800
1883, catch of shad	1,155

Bearing in mind that three years are required, the effect will be observable. In 1879 the Connecticut Commissioners prophesied just what has occurred there. In 1881 hatching was resumed, and a consequent increase in catch for 1884 is predicted.

United States Fish Commission, Feb. 20, 1884.

THE U. S. COMMISSION IN MICHIGAN.

At the Northville and Alpena stations of the United States Fish Commission in Michigan there was laid in a round hundred millions of whitefish eggs last fall. Of these there have been shipped twelve millions to different States and foreign countries. It is expected that from 70,000,000 to 75,000,000 will be hatched and the fry planted in the great lakes.

Brook trout have yielded over 250,000 eggs during the last three months of the past year from the Northville ponds. These have all been disposed of—200,000 to the different States and 25,000 to Germany.

Lake trout, from Lake Huron, furnished nearly 300,000 eggs during November and December; 100,000 of these were sent to Germany and 25,000 to the central station at Washington. The remainder will be hatched and distributed from Northville.

Rainbow trout reared at Northville have developed into spawners, and it is probable that in a few years they will spawn at the same season as the brook trout. This last season they began spawning on Dec. 19, several days before the last brook trout eggs were taken, and the rest will finish before the first of March. Up to Feb. 1, 50,000 eggs were taken.

At Alpena the McDonald jars work better for whitefish than at Northville, because there is a greater head of water and five jars can be operated in a series. The ponds at Northville contain from 250 to 300 young whitefish from five to eight inches in length. They were hatched there last year, and have been fed on chopped liver, the same as young trout.

From a small consignment of eggs of the German trout received last spring from Mr. Fred Mather there are now some 800 fish in one pond. The loss since batching has been slight, but they are smaller than either the brook or the rainbow trout of the same age.

New Publications.

SOME BOOKS.

Camping in the Alleghanies. A new edition of Dr. Thad S. Up de Graff's book familiarly known as "Bodines." It is a very pleasantly written relation of the actual experience of the author and a friend in their annual June camps on the Lycoming Creek in Pennsylvania. The purpose of the chapters is to show what can be done in the way of camping out in localities which are easily accessible. We commend "Bodines" to the perusal of Forest and Stream readers. (J. B. Lippincott & Co.). *Gwenn, A Wave on the Breton Coast.* This new novel, by Blanche Willis Howard, is quite out of the "ordinary run" of fiction. It is an admirable story, well told. (J. R. Osgood & Co.). *Erring, Yet Noble.* Mr. Isaac G. Reed, Jr.'s novel or romance, or harum-scarum what-you-will, which bears the foregoing title, is trash. (T. B. Peterson & Bros.). *Health in the Household, or Hygienic Cookery.* By Susanna W. Dodds, M.D. Dr. Dodds has written a very sensible book considering the subject. A man or woman who sets out to reform the dietetic principles and customs of a nation is apt to display more or less crankiness; Dr. Dodds is in this respect no better nor worse than nine out of every ten food writers. (Fowler & Wells). *Garden and Farm Topics,* by Peter Henderson, is intended to give practical and concise information on a great variety of subjects indicated by the title page. Whatever Mr. Henderson writes on plant life is certain to be sensible, and helpful to those who are less experienced than he. (Peter Henderson & Co.). *The Language of the Hand,* by Henry Frith and Ed. Heron Allen. A dose of yellow-covered literature disguised in a very respectable cloth binding. It sets forth the mysteries of palmistry or chiromancy, which is the art of reading by the hand the past, the present and the future. A firm around the corner in Ann street are reputed to have made a fortune by their sales of dream books, and it may be that there is some demand for such preposterous nonsense as this book on hand-reading. (George Routledge & Sons).

Five to Ten Dollars a Year for all ordinary employments secures $1,000 insurance with $5 weekly indemnity in the Travelers, of Hartford, Conn. Paid accident policy holders $864,000 in 1883.—*Adv.*

A young couple in Oconee county lately married devoted their honeymoon week to sport and killed 120 rabbits. They have salted down the meat and will save buying bacon next summer. This sort of beginning is bound to win in a long run.—*Atlanta (Ga.) Constitution, Feb. 13.*

FIXTURES.

BENCH SHOWS.

March 4, 5, 6 and 7.—Cincinnati Bench Show, Melodian Hall. Entries close Feb. 25. Charles Lincoln, Superintendent, care of B. Kittredge & Co., Cincinnati, Ohio.

March 12, 13 and 14.—New Haven Kennel Club's First Annual Bench Show, Second Regiment Armory. Edward S. Porter, Secretary, Box 657 New Haven, Conn. Entries close March 1.

March 18 to 21.—Washington Bench Show, Masonic Hall, Washington, D. C. Chas. Lincoln, Superintendent.

March 26, 27 and 28.—The Dominion Kennel Club's Second Annual Bench Show, Horticultural Gardens. Charles Lincoln, Superintendent. C. Greville Harston, Secretary, Toronto, Canada.

April 3, 4 and 5.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

May 6, 7, 8 and 9.—The Westminster Kennel Club's Eighth Annual Bench Show, Madison Square Garden. Entries close April 21. Chas. Lincoln, Superintendent. R. C. Cornell, Secretary, 54 William street, New York.

A. K. R.

The American Kennel Register, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **869.** Volume I., bound in cloth, sent postpaid, $1.50.

BEAGLES FOR FOX HUNTING.

Editor Forest and Stream:

In your last issue, "Bugle," in his article on the above subject, puts the query: "And how would the beagle do for fox hunting? Is he too slow?"

In answer, I would say that the beagle will hunt any kind of game that the larger hounds will follow, and with equal zest and staunchness; but hare and rabbits are his legitimate quarry, and for this pursuit he has been bred and perfected.

I am a believer in the symmetry of sport, if I may use the expression, and think the dog should be matched in size to the game, and although a foxhound will run rabbits well and true, it is about as appropriate to use him for that purpose as it would be to pit a mastiff to kill rats.

The beagle would be too slow to hunt foxes where the hunters ride to hounds, but judging from the locality your correspondent hails from, the foxes are shot on runways before the dogs, and for this style of hunting the beagle is fully up to the requirements. I would suggest the English beagle of 14 or 15 inches as about the most useful size.

To show that beagles take kindly to fox hunting, I will state a case that came under my observation several years ago, in Cecil county, Maryland. On a bright, crisp October morning, while out partridge shooting, a fox was roused in a briery thicket in which the setters were working; running out into an adjoining clearing, he sprang on a stump and sat gazing at the dogs.

Sheltered behind a worm fence about seven yards distant, the mark was so tempting that I could not resist, so gave him both barrels, the shells being charged with No. 8 of course no damage was done other than a wild fright. While I stood watching him flying down the valley and across an "old field," the farm boys who were out rabbit hunting joined me with their four beagles. We laid them on the trail which they hit off at once, running breast high, and going at a clinking pace in full cry. While yet in sight a blue mottled puppy ten months old, who had never hunted or seen a fox in his life, forged ahead, took the trail, and made the running, and with the pup on the lead they passed out of sight heading for the Bohemia River, about a mile away.

The boys followed and in about three hours came back with the game little pack. For over two hours the little hounds had harried reynard up and down the river bank among rushes, and cattails, briers and brambles, with never a check, affording numerous chances for a killing shot, but as vulpecide is a heinous crime in the eyes of a Southern fox hunter, the boys with commendable fortitude restrained the impulse, and whipping off the dogs, returned to hunt the "old har" through the devious mazes of a Maryland branch. Rusticus.

Philadelphia, Pa.

EXPERIENCE WITH DOGS.

Editor Forest and Stream:

The first dog I ever owned was four weeks old when "Training vs. Breaking" appeared in your paper. When five weeks old I had taught him to-ho, and when eleven months old he surprised many who "poohed" at the rules as laid down by "Shadow."

I have treated this dog as I would a child; have talked to him, and he understands the English language as well as any animal can; and that is not a little.

I have many newspaper clippings about the intelligence of this dog, and I do not claim to have any better dog than many, but have used him differently. When the city clock strikes 12 o'clock he will be found beside me with one of my overshoes in his mouth, and on my taking it he will, without anything being said, get the other. He has been trained for field work by myself, solely from the reading of the ten chapters of "Training vs. Breaking," and he does some thirty to forty tricks which are not laid down in any book. No whip nor check cord have been used; I never owned either and never shall. In teaching a child would it be necessary to use a whip to teach them their A B C? Neither is it a necessity to have the butt of a dog-whip extending out of your pocket while training your dog pupil.

I cannot agree with "Hunt" about teaching a dog to retrieve under the whip. A friend of mine having a valuable setter, placed him in a trainer's hands to be taught to retrieve. In the course of a few weeks my friend was informed that this pup would never be a retriever, as the trainer said he had tried force and the whip. My friend went and got his pup, and a more disgusted being you would not like to see. I told him that I could teach the pup to retrieve in one week, and a faint smile flitted across his face, and he told me to go ahead. Well, here was a nice pickle. When you would throw anything the pup would run away as soon as he could, and in the house he would get into a corner about as quickly as any dog could. When he brought up he would be on his back with his feet pawing air. This was some of the whip retrieving.

The first two days were used up in trying to gain the confidence of this timid creature. I began by rolling a small towel into a ball and putting carefully in his mouth. He would spit it out as fast as I would let him. At the end of the third day he would hold it a very short time, then going ahead of him a few feet and saying "fetch," he would bring it.

Now for throwing it. Here goes; and away goes the youthful canine in another direction. After getting him back, not using any harshness, he began to think he was not going to be thrashed.

The fifth day he was not fed. I chained him to my desk, and the towel was where he could reach it; his food was not, but he could see it. He would reach for it with his paws and try to gather it in. Before this, after he had held the towel in his mouth and not spit it out I always gave him something to eat.

He began to think that some of the food, which was so near, yet so far, was needful. I would say "fetch," and at last the word did not strike terror to his young mind. About 3 P. M. on this day, on looking around, I saw he had the towel in his mouth, and on saying "fetch," it was brought. Then he was unchained and a little food was given him. On throwing out the usual article, he scampered and brought it in good form. More food. It was thrown thirty times and brought all right. I had one more day to fill my contract. On showing him a quail more of the funny retrieving takes place; but on further investigation he found no whipping, and before night he would bring the quail all right, and to-day he is as good a retriever as there is in town.

Use common sense more and the whip less. I think if you were to take your children for a ride or to some friend's house you would not ornament yourself with the rod; neither is it any more sensible to go forth with a dog whip. A child which will mind in the house will out doors, and just so with a dog that has been treated as a dog should be.

Many persons will scout the idea of a hunting dog doing tricks (some do too many), but I claim that the more you educate your dog the more pleasure you can have with him. It certainly does no harm for a man to know something outside of his profession; the better informed he is the better results from his labors. Just so with a dog. As for honesty, they are far ahead of some of the human family. I can shut my dog in a room with a good roast and tell him that it is not for him, and if he touches it I will give to any charitable institution a barrel of clay-pigeons.

"Shadow" has done more good toward elevating the dog's culture than any other writer living. He advocates firmness, usual tone of voice, no kicks, no clubs, no whips, no yelling. Speed "Training vs. Breaking" for the benefit of this now much-abused animal.

How much more pleasant it is to see your dog wagging his tail every time you look at him than to see that useful member bent under his body, and he in the shape of a half moon through fear. Flick Flick.

Hartford, Conn., Feb. 18.

LICE ON DOGS.

We have recently received several communications requesting information as to a sure method for ridding dogs of lice. Almost all of the various remedies that are recommended for their extermination will have the desired effect provided they are properly applied. None of them will accomplish the purpose unless so applied. We have repeatedly stated that "eternal vigilance is the price of liberty from fleas." This axiom is especially applicable when seeking to circumvent the bloodthirsty *lus.* The main difficulty in getting rid of these troublesome pests is owing to a want of care in applying the remedy. The louse is very prolific and matures at a very early age, and as none of the various remedies will destroy the vitality of the egg, no matter how thorough has been the war of extermination, a day or two will see their ranks again full. It is necessary, therefore, in order to make a sure job of it, that the work be thoroughly done in the first place and thoroughly repeated at least once a week until "the last aimed for expires." Persian insect powder, when rightly used, answers the purpose very well and is perhaps the most cleanly and least troublesome method in cold weather, but as the powder only stupefies and does not kill the insect, it is necessary to follow its application with the fine comb, of course destroying by fire every captive. To apply the powder, place the animal upon a large sheet of strong paper, and with an insect gun or common pepper box thoroughly dust the powder into every portion of his coat, following this with a vigorous shampooing until every insect receives its share. Most of them will at once vacate the premises and fall upon the paper. Those that remain must be found with the comb and all thrown in the fire. This should be repeated every three or four days, until the parasites all disappear. A decoction from quassia wood will also destroy lice. Take two or three ounces of the chips and tie them up in a muslin bag. Suspend them in a pail of water, stirring occasionally. After two hours the decoction is ready for use. Apply it freely, with plenty of soap, and rinse off with clear water. Strong tobacco water, applied in the same manner, may be used with good results, although it is apt to make the animal sick. Whale oil, freely used, is also sure death to lice. This should be thoroughly washed out of the coat within a few minutes after using on account of cleanliness. There are many other remedies that will accomplish the purpose, but those mentioned will be found amply sufficient. Mercurial preparations of all kinds are never to be used for this purpose, as bad results are almost sure to follow. Neither can kerosene be recommended, for the same reason. It is absolutely necessary that the kennel and bedding be attended to or all of your labor will be in vain. A good coat of whitewash put on hot, taking care to fill all the cracks, will render your kennel almost insect proof. The bedding should be changed often. Cedar shavings make the best bed, although those of pine will do very well. The bedding of dogs who sleep in the house should be frequently scalded out in strong soap suds, and after rinsing in clean water, hung in the sun until perfectly dry. By closely observing the above rules any one can soon rid his kennel of both fleas and lice.

A WASHINGTON'S BIRTHDAY RUN.

Since the Rose Tree Hunt was organized, no better or more exciting run has ever taken place than the one enjoyed by this organization and its friends on Washington's Birthday. Fully fifty huntsmen were present at the meet, including those from other clubs, and the number of hounds collected amounted to over two score. This was to be the opening and the great hunt of the season, and it will certainly prove to be such. Reynard was plucky, although bagged, and made a good run of over fifteen miles, and at one time almost outwitted his four-footed pursuers.

At 7 o'clock on the 22d, the hunters were astir, and the red coats of the Rose Tree Club could be observed mingled with the more sombre blue of the West Chester Hunt. Prominent among the number could be seen the veterans H. E. Danbrier and G. W. Eachus, eager for the start. Carroll Smyth on Rosinante, was all expectation. Edward Beale, astride of Firefly, was easily recognized. Old Pandora, as anxious as her rider, carried Dr. Huidekoper, Miss Morns rode Minnie, and Ringgold Lardner handled Orderly. Little Eddy Carpenter crossed his pony Dandy, and Walter Biddle hoped for much from his hunter. W. K. Corliss was master for the day's hunt.

Chester, Media and Shila, members of the Rose Tree Hunt, were also at the meet, started, and kept well up; of these could be seen R. S. Sturgis, H. Hatfield, Geo. E. Darlington, W. Wayne, W. Sharpliss, J. Darlington, S. L. Levy, L. K. Lodge, G. M. Lewis, J. E. Carpenter, Dr. Biddle and C. B. Wright.

Good mounts represented the West Chester Club. Mr. J. Skaner, the noted master of an excellent pack from that place, was present, also H. C. Meredith, Dr. Everhardt, Mr. Mercer, Jos. James, G. A. Mercer, T. Hoopes, Jesse S. Hinton, Passmore Hoopes, B. D. Evans, J. H. Mercer, Davis Taylor, John Gheen, C. W. Lee, F. Wallerton, E. Gatchell, R. Eby, Sheriff W. Baker, W. C. James and John Hannum.

Mortonville was represented by Charles Yedder, B. Young, J. Ortlip and G. Faddius. The Phœnixville Fox Hunter's Club was to have furnished several participants, but only one presented himself, John Yeager, a host in himself, a good and fearless rider.

Ed. Worth, James Slayford and G. S. Leiper came from Chester, Pa., the latter having with him twelve of his noted hounds, prominent among which was Charmer; Ellwood Powell, of Springfield, had sixteen, and these joined with the

noted Rose Tree kennel, swelled the pack to almost forty hounds.

Reynard was let loose from his bag by Rogers, of the Rose Tree Inn, in the woods below the house, and at once seemed to know he must attend to business. The pack were cast off, and directly through Ottey's woods they went, and at first seemed to be at fault. The mellow voice of an "old-time" hound soon evidenced that the trail was found, and the whole pack harked to him, and the chase began. Away toward Crane Creek went the hounds and riders. Reynard had chosen the stream valley as his course, and from the top of the hill the huntsmen could see the dogs plainly, following the trail, and down the declivity all hurried, eager to be as near as possible to the fun.

Westward down the shores of Crane Creek sped reynard, the pack sticking close and pressing him hard. Behind came the riders in full sight, "his craftiness" showing no disposition to select another path but that of the creek valley until the Bodine farm was passed and the West Chester pike near Lamb Tavern was reached. Here it was seen the pack was at fault, and it was a little time before the scent was caught again. The fox had crossed the creek, seeking thus to baffle his pursuers, and not until the hounds had themselves swam the stream was the trail taken up. Corliss, of the field, coming up, cleared the creek first, followed by Miss Morris, Eachus, Beale and Smith. On the eastern side of the creek the riding became very rough, and a half mile of rocky boulders impeding the pack had to be overcome, followed by a high fence which extended to the water's edge. Over it went Rosinante without effort, Eachus following on his gallant steed, then Miss Morris and Minnie. Taylor, of West Chester, essayed the leap, but failed, and falling heavily, bruised himself on the rocky bottom. Up again before many of his followers had come up with him he was mounted and with the field once more. At Justie's farm, reynard, pushed to desperation, made for the barn up on the hill and tried to hole in the hay, but the pack caught up with him and he gave up the ghost. Mr. Eachus, closely following, dismounted in time to save the brush, and proclaimed himself first at the death. Next came Miss Morris and Carrol Smyth abreast, then Ed. Beale and Ringgold Lardner, hard pressed by Walter Biddle. The balance of the field followed straggling. After a ride of four or five miles the Rose Tree was reached, and all, delighted with the day's sport, sat down to a substantial dinner.

HOMO.

PHILADELPHIA.

THE KENNEL HOSPITAL.

VI.—INFLAMMATION.

THE frequent occurrence of inflammation as an accompaniment of disease or injury renders any rational consideration of its appearance and effects in different parts of the body impossible until we have first attempted to explain what it is. Unfortunately, this entails perhaps a dryer and more technical chapter than ordinary readers will care for, but I cannot see my way to omit it without fostering the notion that doctoring dogs requires less knowledge than doctoring other animals.

"Inflammation," says Barlow, "in its various forms and localities is the most frequent condition of disease and the most common cause of death among domestic animals. As a term, it is one with which we become early familar, and certain sensations and appearances denoting its existence are well known to us all. It is a process with which for ages past theory has taken the utmost freedom." Erroneous theories have given rise to irrational medical surgical practice, and even now in canine practice it is too commonly believed that the only appropriate remedies are those which reduce the vital powers.

Inflammation has now been demonstrated to be a process of perverted nutrition, not a mere burning or consuming, as the term (*inflammo*, to burn) would imply, nor merely an increased determination of blood to a part, attended by heat, pain, redness and swelling.

In order to understand this process of perverted nutrition, we must shortly say how healthy nutrition is performed. The mass of the animal body consists of substances known as flesh, bones, nerves, skin, etc., which we call tissues. In consequence of waste sustained in the performance of their functions, they are in need of continuous repair. In health blood is always circulating through minute vessels in the smallest interstices of the tissues. Through the coats of these vessels fluids can pass to and fro. Thus nutritive material for the repair of the tissues is supplied at the same time that the waste, resulting from their action, is removed. It is this process by which the circulating blood preserves the balance of waste and repair in the tissues that constitutes nutrition. These are three factors in the process—the tissue, the blood vessel, and the circulating blood. All three must be healthy, and each must perform its proper part or healthy nutrition is impossible.

Blood is propelled by the heart through large vessels (arteries), which divide and subdivide until they appear as tubes of most minute or hair-like fineness, called capillaries. From capillaries alone all nutrition takes place. Their walls consist of a thin transparent membrane so delicate as to permit exudation through it of the nutritive fluids from the blood. Seen under a microscope blood is not a uniform red fluid, but is shown to consist of a colorless fluid (*liquor sanguinis*) in which float solid particles (corpuscles or globules), some white, but most red. Seen flowing through the capillaries the *liquor sanguinis* passes along in contact with the walls of the vessel, while the corpuscles keep in the center of the stream. The flow is constant and steady, the corpuscles never becoming crowded or passing through the coats of the vessel, and the *liquor sanguinis* only transuding in a degree suitable to the exact requirements of the nutrition of the part.

Under a microscope the circulation in the wing of a bat, or better still, the web of a frog's foot can be seen distinctly. By irritating the part we can induce the process of inflammation, and watch its various stages. On the application of an irritant, the capillary vessel contracts so that its caliber is lessened and the motion of the blood within increased in rapidity. This condition soon gives place to another, in which the vessel is seen distended, and the flow of blood within is retarded; the inflammatory process has commenced, and the stage reached is active congestion. The distended capillary loses its contractile power; the blood globules become crowded together, and forced against the walls of the vessel, while the current of blood is almost arrested, and the quantity of fluid transuded is increased. This is passive congestion. A stage further the distension of the vessel increases; the blood within it becomes stagnant; exudation of *liquor sanguinis* through the coats takes place in abnormal quantities; the blood globules escape, and the coats of the vessel give way, allowing blood to escape into the surrounding tissues. This is acute inflammation.

These same changes that we can see going on in the blood vessels of the transparent web of a frog's foot, occur in every inflamed part. Not one capillary, but many are implicated, and the circulation is disturbed all around the effected part. It must be noticed that inflammation is not a definite, limited condition, but a process passing through certain stages, each of which differs somewhat in kind; all of which, however, exist together in and around an inflamed part, and none of which are compatible with healthy nutrition. In a small pimple we have a good illustration of a simple circumscribed inflammation. In its center there is stagnation of blood and exudation of *liquor sanguinis*, outside of this an area in which dilatation of the capillaries, and a retarded current through them is the great feature; beyond this another area of dilated capillaries, in which, however, the flow of blood is still active.

Keeping to our illustration of the inflammatory process—a pimple, we notice certain conditions which are common to nearly all inflammations. We find swelling, redness, heat and pain—changes which, from the most remote times, have been recognized as the symptoms of inflammation. Some interpretation of their cause and nature may be conveniently offered here.

Swelling.—The amount of swelling in an inflamed part, depends upon the quantity of *liquor sanguinis* exuded from the vessels. Swelling is greatest in inflammations of soft and elastic organs. It is not of itself a correct criterion of the gravity of the condition, being hardly perceptible in some serious inflammations, and very great in some comparatively trivial cases. Swelling often exists without inflammation, as in cases of dropsy, and in those not uncommon cases of swelling of the dog's foot from an improperly applied bandage round the upper part of the limb. As a rule, the swelling of inflammation is resilient, as, if pressed by the finger, it yields, but immediately the pressure is removed resumes its original form. The swelling caused by non-inflammatory exudations behaves differently, it pits on pressure with the finger like dough—the impression of the finger remaining for some time after pressure is removed. Swelling when it accompanies inflammation of an external organ is seldom dangerous; but when it effects the tongue, nose, or throat, it may cause serious mischief, or even death, by blocking up the passages for air or food.

Redness.—The increased redness of an inflamed part is due to the enlargement of the blood vessels, and consequently the amount of redness depends upon the number of vessels in a part. The changes in color of diseased portions of a dog's body are not very apparent, especially those covered by a dark coat. In all animals, however, it may be noticed on the membranes of the nose, mouth, and eyes. In light-colored dogs the redness of an inflamed skin is very evident, but it must not be thought that all redness is due to inflammation. What is called "red mange," and that more common redness of white-haired dogs, which is simply due to excessive use of strong alkaline soaps, depends upon an enlargement of blood vessels, but not a real inflammatory condition. The vessels are enlarged, but only to the stage we described as active congestion.

Heat.—That the temperature of an inflamed part is raised there is no doubt, but the sensation of heat felt by the patient is quite out of proportion to what really exists. The extra heat is simply due to the extra amount of blood in the part. The blood of an inflamed part is not hotter than that at the heart or in the center of the body. The extremities of an animal being furthest from the center of circulation are always colder than other parts of the body, consequently when inflamed they show a relatively greater amount of increased heat. An inflamed foot or ear gives an impression of increased heat to the touch much greater than a similar inflammation of the trunk.

Pain.—The pain of inflammation depends greatly upon the tension or pressure upon the nerves of the part by swelling. In soft or elastic organs, where the inflammatory swelling is not confined, pain is comparatively slight, as in diseases of the liver, or in some injuries to muscle. In parts where little soft tissue exists, and where bone and ligaments surround it, great pain accompanies even limited inflammatory actions. Examples of this are seen in inflammation of the claws, the ear, and the teeth. Inflammation may exist without pain—*e. g.*, as the result of injury to a paralyzed limb. Pain may exist without inflammation, as in some nervous affections, and in spasm or cramp.

The importance of an inflammation depends upon its extent and degree, but still more upon the kind of structure in which it occurs. It is at all times, and in all places, a destructive process, interfering with the nutrition of the affected tissues, which are only repaired on its cessation. It is not a process of excited action in a part, but of perverted action. Its evils are most apparent in organs endowed with special functions, such functions being always checked, perverted or even entirely arrested. Inflammation of the nose, eye, or ear is accompanied by more or less impairment of the senses of smelling, seeing, or hearing. When the inflammatory process takes place in any of these organs most immediately concerned in the maintenance of life, such as the brain, lungs, or heart, it is always dangerous, owing to the effect upon their functions.

Although the pathologist tells us that the essential conditions of inflammation are always the same—viz., perverted nutrition in a part, the practical surgeon takes cognizance of many variations, if not varieties, of the process, dependent upon the seat of the disease, the stage to which it rises, and the probable results and complications.—*William Hunting in Land and Water.*

WORKING THE DOGS ON WOODCOCK.

I HAVE spent two pleasant days hunting woodcock with one of your correspondents, whose *non de plume* is "Vitus," and we have made remarkable bags for this section. One or two of your correspondents in their replies to "Vitus" stated that if he had had experience in the field and did not refer so much to books, he would know more of the Gordon and their good qualities. I will say this much for the benefit of those correspondents, that if either one of them could travel over our woodcock grounds with him for one day, he would feel perfectly satisfied with his walking and shooting, and with the good actions of his dogs, if not with his opinions on the Gordon. As for his walking, he can tire a mule; he is a good shot, and his dog Echo is the best in this section for snipe, woodcock or partridge. But back to the point. At half past 5 A. M. we started for the swamp, "Vitus" with Echo, and I with my dropper Spot. Reaching the swamp both dogs were cast off, Echo to the left, Spot to the right. Soon I heard "Vitus's" gun. He had flushed a cock and made a clean miss. The bird lit close to me, I flushed, and scored a splendid miss also. The laugh which I had over "Vitus" was now turned. I then passed to the left of V. and Spot made a good point, but before I could call up V., up jumped two birds; I made a right and left, and brought both birds to bag, which were retrieved by Echo.

We then took down a bunch of canes, V. on the right and I on the left. Echo drops on point and V. calls me to come up; I took a good position and told him to flush, which he did. He scored a miss with his right barrel, but brought the bird to bag with the left. We then passed on for the space of about fifty yards when both dogs dropped on point; this was a beautiful sight, Echo a little behind Spot, the two making a perfect picture. V. told me to flush. I did so, and up jumped four birds; I bagged two and V. one and passed on. Down came Echo. V. flushed and I brought the bird to bag. About twenty yards further; and down again came Echo. V. flushed and I bagged again. This gave me six to his two, which looked as if I were going to have the best of the old man.

We then started for the next run in the swamp. On arriving Spot began to draw; the bird flushed, I fired and missed, and V. bagged. Down came Echo. V. called, but being some distance from him I did not hear him; he came after me, and when we got back to where the dog was on point, we found him at a down charge with his head to one side on the bird; he had stood so long that he had got tired, and had dropped to charge. V. flushed and brought the bird to bag. We passed on and Spot dropped to point, and as the place was open I started to flush without calling V., when up jumped a covey of partridges, of which I bagged one; we did not follow them up, however, as we were bent on woodcock. On swept the dogs; down dropped Spot. I jumped and bagged a cock, and passed on to the next run. These runs are springy sloughs which run from the high land down to the swamp, and with us are the best points for woodcock. Echo dropped to point. V. flushed, and up jumped another covey of partridges; V. bagged two. Echo dropped again; V. flushed and I bagged. Once again Echo drops; V. flushes and I bag.

At the next run we found the birds very wild. There were several parties in the swamp, and though they killed but few, they chased the others so much that they would flush at the approach of a dog, which made it hard work for both man and dog. Still, however, we kept up courage and banged away, determined to make the best bag of the season, which we finally did. I thought at first that I would leave the old man behind, but at the close of the day when we counted our game he had bird for bird, in all twenty-eight woodcock and six partridges. This is considered an extraordinary bag for this section for two guns, ten or twelve being considered excellent.

The second day we started for the same swamp, and, like the first day, I got the better of "Vitus" at the start, but he soon caught up, and in the end was in the lead. This time we bagged twenty-three woodcock, two partridges and a snipe, making in the two days in all fifty-seven woodcock flushed and fifty-one bagged.

The first day two were killed by V. which could not be found, and which must have been caught in the brush, as it was very thick. It seems to me that this was pretty fair shooting, fifty-three out of fifty-seven, especially since "Vitus" has so little experience in the field." Your correspondents and lovers of the Gordon would have us believe that he shoots the most of his birds out of books, but I think he will do in the field.

BALDIA.

SAVANNAH, Ga.

FOREST AND STREAM DOG PICTURES.—We have issued a new series of pictures of winning dogs at field trials. The ready sale which these pictures have had show that sportsmen very generally are anxious to learn something about how these winning dogs look. We cannot all of us visit the trials held at points far distant from our homes, and if we could do this, we should still be unable by looking a few times at a dog to carry away with us a complete and permanent mental picture of the best animals. Any one who has ever tried to form an idea of the appearance of some breed of dog that he has never seen, from a written description, knows that this is something that cannot be done. The books imagine a standard and then describe it, but a man who had never seen the strain spoken of could learn nothing from the description. A picture is first needed. The engravings which we have published include twenty-six of the most celebrated pointers and setters of the day, and they cannot fail to be of value to all interested in these dogs. They are the work of several of our best artists, and they are striking and life-like. In our advertising columns will be found a list of the animals portrayed.

WASHINGTON SHOW.—Cincinnati, O., Feb. 23.—*Editor Forest and Stream:* I am glad to say to you, that the Masonic Hall, in Washington, has been secured for the second annual bench show, to be given on the 18th, 19th, 20th and 21st of March next. Entries close on March 10. The prize lists will be sent out as early as possible, and a number of them mailed to you, so that parties desirous of obtaining them can get them at your office, or by addressing me at Washington, D. C. The show will undoubtedly be a good one, judging from the numerous inquiries I have received, wanting to know if a bench show would be given this year, and as you know every one wants to go to the capital city of the nation, so the bench show will afford the sportsmen and lovers of dogs a good opportunity. The judges so far appointed are Hon. John. S. Wise and Major Taylor, for English setters and pointers; Mr. James Mortimer, for non-sporting dogs; for Gordon and Irish setters, not decided on; for spaniels, beagles and foxhounds, not decided on.—CHAS. LINCOLN, Superintendent.

SHALL ST. LOUIS HAVE A SHOW?—St. Louis, Mo., Feb. 24.—*Editor Forest and Stream:* I want to find out, as far as possible, what the "dog men" think of having us give a grand bench show in St. Louis, in April, say the 15th. The St. Louis Gun Club will give it if sufficiently encouraged by dog owners, to look for a good number of entries. May I ask them, through the medium of this notice, to write to me what they think of it, and what number of entries they will be likely to make if we offer an attractive prize list in cash and specials, and I will announce at once if the show will be given. The shows already announced are Cincinnati, March 4; New Haven, March 12; Washington, March 18; Toronto, March 25; Cleveland, April 4; New York, May 6. I see no reason why we can't slip in with ours between Cleveland and New York, and catch the best dogs in the country, as they are then supposed to be in show form. Gentlemen, let me hear from you at once.—JOHN W. MUNSON (317 Chestnut street).

NEW ENGLAND KENNEL.—There is a movement on foot in this city to organize a New England Kennel Club for the importation and breeding of thoroughbred dogs for sporting and domestic purposes. Several well known gentlemen of this city and vicinity with this purpose in view met at the Parker House on Friday, and after discussing the subject appointed a committee to take the matter under consideration, with instructions to report at a meeting to be announced for some day during the present week at the same hotel. The programme proposed embraces the establishment of a large kennel, something after that of the old Harvard kennel of Cambridge. It appears that during the past few years many of the best strains of breeding dogs have been removed from this section of the country, among them the celebrated Dash and mate, which have gone to the Nesbeth kennels in Iowa.—*Boston Herald, Feb. 24.*

NEW HAVEN SHOW.—*Editor Forest and Stream:* The first thing I noticed on receiving the New Haven Kennel Club's schedule for their first annual, to be held the 12th, 13th and 14th of next March, was the total absence of cash prizes. That is a grave mistake. Medals, with the majority of exhibitors, especially those from afar, do not give the satisfaction that is obtained by giving cash prizes. This system of awards keep away a good many people who otherwise would exhibit. People do not feel like paying $2 to enter their dogs, and, if lucky enough to win first prize, receive nothing but a silver medal. I see that the bull-terriers are well provided for, but the bulldogs do not fare so well; the sexes are not even divided. I am astonished at this, as there have been so many good bulldogs imported this fall.—BULLDOG.

CINCINNATI SHOW.—Cincinnati, O., Feb. 23.—*Editor Forest and Stream:* Messrs. W. B. Shattuc and A. A. Bennett have consented to act as board of arbitration for this show, in case any protests should be made from the judges' decisions. I am requested to state that the judges will be instructed to make due allowance for want of coat and feather, from any cause they may think justifiable.—CHAS. LINCOLN, Superintendent.

TORONTO DOG SHOW.—It is possible that a trial of collies may be held in connection with the Toronto Bench Show, if suitable grounds can be obtained for it. A large number of special prizes will be given in the different classes, among them the Dominion Club offers a $75 cup for best six dogs of any breed, owned and breed in the Dominion; and there will be a $25 cup for best setter in show.

NEW HAVEN BENCH SHOW.—New Haven, Conn.—*Editor Forest and Stream:* Will you be kind enough to announce in this week's issue that classes will be formed for greyhounds and collies, for dogs, bitches, champions and puppies, and also for other breeds where the division is necessary. There will be many specials.—E. S. PORTER, Secretary, N. H. K. C.

SANTA CRUZ, Cal., boasts a litter of eight Gordon setter pups with no ears.

NEWARK DOG THIEVES.—Dog thieves are on the rampage in Newark, as usual. The last case reported is that of a pure liver-colored setter dog. Sam, white spot on chest, white toe on left fore and right hind legs, also white nails on other feet, not noticeable except when dog's feet are washed. Reward for information leading to recovery. All communications will be considered strictly private, by F. Satterthwaite (2 West Park street, Newark, N. J.).

POINTERS AND SETTERS.—Attention is called to the advertisement of pointers and setters for sale by Mr. F. Satterthwaite, published in another column. Mr. Satterthwaite knows what a good dog is, and we presume those he advertises are worth inspecting.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Sam, Jr. By Mr. E. G. Babcock, New Britain, Ct., for dark liver, white markings, cocker spaniel, whelped Dec. 6, 1883, by Col. Stubbs out of Diamond.

Fancy. By Mr. E. G. Babcock, New Britain, Ct., for dark liver, white breast, cocker spaniel bitch, whelped Aug. 10, 1883, by Quand out of Piper.

Modesty. By Mr. John W. Munson, St. Louis, Mo., for liver and white pointer bitch, 2 years old, by Croxteth out of Trinket.

Brimstone, Madstone, Touchstone, Luckystone and Clingstone. By the Westminster Kennel Club, for liver and white pointers, one dog and four bitches, whelped Aug. 24, 1883, by Tory out of Moonstone. Imported in utero.

Queen Dido. By Dr. S. H. Greene, Newmarket, N. H., for black spaniel bitch, whelped Dec. 15, 1883, by Obo II. (A.K.R. 432) out of Rubie (A.K.R 734).

Floss II. By Mr. L. C. Andrus, Malone, N. Y., for liver and white cocker spaniel bitch, whelped July 20, 1883, by Handy (Racer—Ruth) out of Nellie Cohern (Sport—Curley).

Vixen. By Mr. F. L. Stebbins, Geneva, N. Y., for liver and white cocker spaniel bitch, whelped April 20, 1883, by Dick (Ringold—Dot) out of Little Flirt (Snip—Frolic).

NAMES CHANGED.

☞ *See instructions at head of this column.*

Jessie to Lady Bub. Black cocker spaniel bitch, whelped March 12, 1880, by imported Bub (A.K.R. 131) out of imported Jennie, owned by Mr. Herman F. Schellhass, Brooklyn, N. Y.

BRED.

☞ *See instructions at head of this column.*

Modesty—Bang. Mr. John W. Munson's (St. Louis, Mo.,) liver and white pointer bitch Modesty to imported Bang (champion Bang—Luna), Jan. 12 and 14.

Polly—Bang Bang. Mr. W. Tallman's bitch Polly (Beaufort———) to the Westminster Kennel Club's pointer Bang Bang, Feb. 15.

Rue—Bang Bang. Mr. Bayard Thayer's bitch Rue (Snapshot—Ruby) to the Westminster Kennel Club's pointer Bang Bang, Feb. 18.

Lotta—Sensation. Mr. A. B Conger's bitch Lotta (Faust—Clarg) to the Westminster Kennel Club's pointer Sensation.

Fly—Croxteth. Mr. Fullerton's pointer bitch Fly to Mr. A. E. Godeffroy's Croxteth, Jan. 15.

Folly—Croxteth. Mr Walker's pointer bitch Folly to Mr. A. E. Godeffroy's Croxteth, Feb. 14.

Daisy—Glencho. Mr. G. Hills's (Hudson, N.Y.) red Irish setter bitch Daisy (Chief—Tilley) to Glencho (Elcho—Noreen), Jan. 31.

Lady Bub—Benedict's Boy. Mr. Herman F. Schellhass's (Brooklyn, N. Y.) black cocker spaniel bitch Lady Bub (A.K.R. —) to his Benedict's Boy (A.K.R. 130), Feb. 10.

WHELPS.

☞ *See instructions at head of this column.*

Lofty. Mr. J. P. Willey's (Salmon Falls, N. H.) cocker spaniel bitch Lofty (A.K.R. 431), Feb. 13, four (one dog), by Obo II. (A.K.R. 432); all black.

SALES.

☞ *See instructions at head of this column.*

Beauchief. Collie dog, whelped April 25, 1883 (Gyp—Buttercup), by Mr. Arthur L. Kelley, Lawrence, Mass., to Miss Ida F. Warren, Leicester, Mass.

Elcho—Meg whelp. Red Irish setter bitch, whelped July 21, 1883, by Elcho (Charlie—Nell) out of Meg (Elcho—Rose), by Mr. Benj. F. Clark, Manchester, N. H., to Mr. Frank Prendergast, Boston, Mass.

Don Juan. White, black and ticked English setter dog, whelped April 16, 1883 (champion Dash III.—Katydid), by Mr. E. H. Fisher, Jr., New Bedford, Mass., to Mr. F. C. Snow, Dover, N. H.

Gem. Mulberry fawn mastiff dog (A.K.R. 12), by Mr. Wm. Wade, Pittsburgh, Pa., to Mr. C. F. Wilson, Palmyra, O.

Jessie. Black cocker spaniel bitch, whelped March 12, 1880, by imported Bub (A.K.R. 131) out of imported Jennie (champion Brush, E.K.C.S.B. 7,371—champion Rhea, E.K.C.S.B. 2,223), by Mr. D. C. Frank, Tremont, N. Y., to Mr. Herman F. Schellhass, Brooklyn, N. Y.

Rose. Red Irish setter bitch, whelped Aug. 22, 1883, by Glencho out of Colleen Bawn (A.K.R. 507), by Mr. Chas. R. Squire, Troy, N. Y., to Mr. John H. Nesbitt, W st Troy, N. Y.

Drouse. Liver and white and liver ticked English pointer dog, whelped Oct. 30, 1883, by Beacher out of Vinnie II. (A.K.R. 466), by Mr. Mr. Charles R. Squire, Troy, N. Y., to Mr. John H. Nesbitt, West Troy, N. Y.

Modesty. Red Irish setter bitch, whelped Sept. 10, 1882, by Scout (Plunket—Carrie) out of Grace (Hill—Donna), by Mr. A. W. Pearson, Huntington, N. Y., to Mr. P. Mahony, Brooklyn, N. Y.

Nellie. Black and tan foxhound bitch, by Mr. D. C. Paulding, White Plains, N. Y., to Mr. C. H. Kent, Monticello, N. Y.

Baronet—Rita Croxteth who. Pointers, whelped Dec. 22, 1883 (champion Baronet—champion Rita Croxteth), by Mr. Geo. S. Tucker, Peterborough, N. H., a liver and white bitch and lemon and white dog to Mr. Geo. L. V. Tyler, West Newton, Mass.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Bessie Case. Black, white and tan setter bitch, by Fritz (Roderick—Norna) out of Duff (Carlowitz—Rose), by Mr. John W. Munson, St. Louis, Mo., to Mr. Geo. A. Castleman, same place.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

F. M. L., Summit Station, O.—1. About March 1. 2. Write to the manufacturers.

R. W. M., Alexandria, Va.—We know nothing of the new English rifle referred to.

B., Toledo, O.—For some hints on care of quail in confinement see editorial columns.

New Subscriber, New Hampshire.—A 12-bore will do for your shooting. See page 86 of this issue.

L. B., Jr., Boston.—For government charts, apply to I. Thaxter & Son, No. 125 State street, in your city.

W. D. D., Ottawa.—For information respecting English hurdle racing, consult some of the horse papers.

J. M. H., Brooklyn.—You can get areca nut of druggists, or send to the firms which advertise it in our columns.

B. H.—For instructions in trapping consult Gibson's "Complete American Trapper," price $1. We can supply it.

Lone Angler.—1. The index to Vol. XXI. will probably be printed next week. 2 The rod is worth the price asked for it.

W. H., New York.—Address of Secretary New Jersey Fish and Game Protective Society is Wm. L. Force, Plainfield, N. J.

Brooklynite.—1. The .20 long will carry further than the .22 short. 2. Clean the gunstock thoroughly, apply sweet oil and rub it briskly.

Hunting Horn.—Have lost your address or would send the issue containing directions how to make a hunting horn. It was the paper of April 19, 1883.

L. L. B., Washington Ter.—Coues's "Fur-Bearing Animals" relates to those of this country; Van Dyke's "Still-Hunter" gives directions for deer hunting in America. Mr. Van Dyke lives in California. Dealers in wild animals are Chas. Reiche & Bro., Chatham street, New York.

C. A. R., Pittsburgh, Pa.—The best material for a canoe deck is mahogany or Spanish cedar ¼in. thick, as it will stand both sun and water without checking.

G. C. B., North Granville, N. Y.—How far will a .32-caliber rifle, using long cartridges, shoot with accuracy? Ans. Excellent work may be relied on at 100 yards.

W. R., Philadelphia.—The charges you name are not excessive. As to difference of recoil, that is something that would be determined only by actual comparative test.

W. F. K., Tioga County, N. Y.—We can send you the digest of New York game laws compiled under direction of the Commissioners of Fisheries. Price twenty-five cents.

W. G. V., Ballardvale, Mass.—1. You can shoot squirrels, rabbits and quail with your 16-bore gun. 2. Dr. Carver is the champion wing-shot of the world, so far as there is any such championship.

N. W., Hudson Centre, N. H.—1. Would parties trapping be responsible for damage done to dogs caught in traps? 2. Is there any difference in the shooting qualities of Damascus, or laminated steel? Ans. 1. No. 2. No.

W. E. M., Massachusetts.—1. We have refused the advertisement of the gun dealers named, because we do not consider them reliable. 2. Minks and muskrats are found on salt marshes as well as on fresh water streams.

W. F., Greece, N. Y.—We have never been able to learn anything thing more about the "anti-bow" machine than was printed in our issue of Oct. 4, 1883. Perhaps that item should have gone among the "Camp-Fire Flickerings."

J. B. D., North Granville, N. Y.—Give me dimensions of a regulation Creedmoor target reduced for a gallery. Ans. Write to Dennison & Co., New York, or to J. S. Conlin, Broadway and Thirty-first street, New York, for sample targets.

S. C., Troy, New York.—For the articles on left-eyed shooting see issues of Sept. 29 and Oct. 6, 1881. As to the use of one eye or two eyes in shooting, there is a wide diversity of opinion. Some of the crack shots shut one eye, others keep both open.

G. H. H., Maine.—There is little difference between the shooting of a 28-inch barrel and that of a 30-inch barrel. The latter will burn a little more powder than the former; and some say that the extra length is of service in aiming, though we have not found it so.

W. E. C., Menlo, Iowa.—There is no special hunter's map of Michigan that we know of. Any standard map will probably answer your purpose. You might find what you want in the numerous railroad guide book maps that are published by the Michigan railroads.

T. L., Philadelphia.—Guns are usually targeted at 30in. circle, 40yds. These targets are easily prepared, or you may obtain them already printed at the gun stores. A modified chokebore will probably give you the best satisfaction on the game and clay-pigeons.

W. N. L., Good Ground, Long Island.—They are netting ducks by the hundreds here. Is there no way to stop it? Ans. Netting ducks is against the law. You may stop it by informing the game protector of your district, Geo. A. Whittaker, Southampton, and calling on him to prosecute the guilty parties.

J. J. T., Mansfield, Ohio.—If you cut the gun off back of the "pocket" it will not shoot so closely as it does now; but you do not state length of barrel, so we cannot advise you. Try varying proportions of powder and shot charges. You may in this way alter the shooting to a satisfactory result.

Buckeye, Ohio.—What is the difference between the muzzle diameter of a 10-gauge full choke and a 12-gauge cylinder bore? Ans. It depends upon the degree and style of choke. If both were cylinder bores, the difference would be that between .775in. for the 10-gauge and .729in. for the 12-gauge, or .046in.

W. A. R., New Haven, Conn.—The Fish Commissioners of Massachusetts are: E. A. Brackett, Winchester; E. H. Lathrop, Springfield, and F. W. Putnam, Cambridge. New Hampshire: G. W. Riddle, Manchester; Luther Hayes, South Milton; E. B. Hodge, Plymouth. Maine: E. M. Stilwell, Bangor; H. O. Stanley, Dixfield. Connecticut: Dr. W. M. Hudson, Hartford; R. G. Pike, Middletown.

Ned, Allegany, N. Y.—1. What is the regular price for mounting deer heads upon black walnut shields? 2. Who publishes a reliable hardware trade journal in New York. Ans. 1. There is no regular price. Much depends on the length of neck and other matters. Eight dollars for a short-necked head and twelve for a long is about the figure. 2. Try the *Iron Age*, David Williams, publisher, Chambers street, New York.

J. H., Guilford, Me.—Dr. Coues's book on the "Fur-Bearing Animals" treats of the natural history of the subject. Gibson's book (mentioned elsewhere in this column) tells how to trap. We know of no book treating specially of fur buying. If you want to keep posted, in fur prices communicate with the commission firms, as Wm. Macnaughtan's Sons, New York, who, we believe, are successors of the great fur millionaire, John Jacob Astor.

Sport, Brooklyn.—1. Bird lime is made as follows: Boil down linseed oil of the best quality until it becomes thick and glutinous. Boil in earthen pot, in open air, for two or three hours, and be sure that the cover of the pot fits tightly, so that the oil will not catch fire. When boiled, set away in tin vessels with tight fitting covers. To use it: Select small, dry sticks, as thick as a straw and eight inches long. Sharpen the edges, smear them with the lime, and fasten the sticks into grooves cut in a stake stuck into the ground. Place a "call bird" as a lure. When the birds alight upon the sticks they pull them out from the main stake, and when flying the wings, coming in contact with the lime, are pinioned to the sides. 2. We will receive two-cent stamps for the dog pictures.

H. F. S., Brooklyn.—For trapping book see answer to B. H. For hunting rifle and its use you cannot do better than to look through the files of the Forest and Stream for hints on target shooting especially, see review of Farrow's book in our issue of March 22, 1883, or buy the book itself ($1). There are a number of good books on the shotgun, adapted to your purpose, among them Bogardus's "Field, Cover and Trap Shooting" ($2). "Wing-Shooting," by "Chipmunk" (50 cents). For a book on camping out we advise you to wait until the publication of "Woodcraft," by our well-known contributor "Nessmuk." It will be ready in about a month. Perhaps the work best adapted to meet your needs is Hallock's "Sportsman's Gazetteer" ($3), which treats of game, guns, rifles, etc.

W. H. A., Canada.—The maximum weights of different members of the deer family are given by Judge Caton as follows: Moose, more than 1,200lbs. Elk, or wapiti deer, exceeding 1,000lbs. Woodland caribou, 400lbs. (probably more, though record of none heavier known to author). Mule deer, 250lbs.; average much lower. Columbia black-tailed deer (rare specimens), 150lbs; average much lower. Common deer (*Cervus virginianus*), largest of which author has authentic record, killed in Michigan, weighed before dressing 246lbs.; "average weight may be set down as not more than one hundred pounds. The guesses of hunters often give much larger weights." Generally larger on Northern than Southern ranges. Mexican deer (which author says is but a variety of *C. virginianus*) is much smaller than his Northern brother. Barren ground caribou, or Arctic reindeer, 150lbs. (average much lower). Acapulco deer (specimens in possession of author), 30 to 40lbs.

Tanner.—For tanning, Mr. Gibson in his "Complete American Trapper" recommends the following: "For tanning with the hair on, the skin should first be cleaned, every particle of loose fat or flesh being removed, and the useless parts cut away. When this is done, it should be soaked for an hour or two in warm water. The following mixture should then be prepared: Take equal parts of borax, saltpetre and sulphate of soda, and with them mix water sufficient to produce the consistency of thin batter. This preparation should be painted thickly on the flesh side of the skin, after which these sides should be doubled together and the pelt left in an airy place. A second mixture should next be prepared. This should consist of two parts sal soda, three parts borax, four parts castile or other hard soap, all to be melted together over a slow fire. At the end of twenty-four hours after the application of the first mixture, the second should be applied in a similar manner, and the fur again left for the same length of time. Next make a mixture equal parts of salt and alum, dissolved in warm water and thickened with coarse flour to the consistency of thin paste. Spread this thickly over the skin and allow it to dry, after which it should be scraped off with the bowl of a spoon. The skin should be tightly stretched during the operation, in order to prevent too great shrinkage. A single application of the last named dressing is generally sufficient for small skins; but a second or third treatment may be resorted to if required, to make the skin soft and pliable, after which it should be finished off with sand-paper and pumice stone. A skin may be thus dressed as soft as velvet, and the alum and salt will set the hair securely."

INFORMATION WANTED.

F. M. P. (of New York) wants to know of desirable quail locality in Virginia, in season.

W. H. R. (of Boston) and five companions wish to go fishing in a yacht in July, two weeks, expenses not to exceed $50 for the entire party; and they want to know where they shall go.

"Lone Angler" wishes to know of a place to spend the spring and summer in the western part of Maine or in New Hampshire, away from the railroads, where the woods are well preserved, with good fly-fishing and fair accommodations.

Rifle and Trap Shooting.

FIXTURES.

First International Clay-Pigeon Tournament, at Chicago, Ill., May 26 to 31. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

ARMY PRACTICE IN 1884.

Lieutenant-General Sheridan is determined that the modern idea of long-range military practice shall be introduced into the regular army, and besides he has given the whole subject of army practice an overhauling, in preparation for the work of 1884. He directs in a recent order that wherever necessary ranges can be obtained, marksmen will be advanced in regular target practice to distances of 800, 900 and 1,000yds., using service rifles and service ammunition.

The grade of sharp shooter is established. To enter this class the following percentages will be required: 88 per cent. at 200, 300 and 600yds. each, and 76 per cent. at 800, 900 and 1,000yds. each. Division and department commanders in their discretion will extend to sharpshooters such privileges as interests of the service will permit.

In view of the greater amount of ammunition now authorized, and the increased skill attained under systematic training in rifle firing, requirements heretofore adopted are raised. Hereafter the best three scores made (each having the required percentage) will determine annual classifications. In calculating the figure of merit all company officers and regimental staff will be included; sharpshooters will each be given a multiplier of 200. Besides those now excluded from consideration, all who desert or are transferred or discharged during the first month, and all who are prevented by sickness from firing during the whole practice season, will also be disregarded. Medical certificates will be required to accompany exceptions claimed on account of sickness.

When supplied, the following insignia will be worn to indicate skill in marksmanship. Marksmen qualifying during the current year will always wear one pair of marksman's buttons. Those qualifying for the second time may wear two pairs. After qualifying three times (not necessarily in consecutive years), a marksman's pin will be worn on the left breast. Those wearing marksman's pins will not wear more than the single pair of marksman's buttons, indicating renewed qualification during the year. A sharpshooter will be indicated by a small bronze cross worn below the opening of the coat collar while he continues to qualify annually in that class. The cross and the pin will be the property of the winners, and they may be worn upon the breast after ceasing to qualify in the corresponding classes. They will be issued and sold according to present regulations concerning marksmen's buttons.

When, through no fault of his own (either through detached service or sickness through the shooting season), a marksman or a sharpshooter has no opportunity to qualify the next succeeding year, he may continue to wear the insignia of his class for another year. Certificates for marksmen and sharpshooters will be supplied by the Adjutant-General of the army, and will be issued from department headquarters, with qualifying scores entered upon them, to those entitled to receive them.

Hereafter, all duly qualified marksmen in the army will be considered eligible for selection to attend annual department competitions; but whenever any marksman has been three times member of a department team or has won any three of the authorized prize medals, he will be announced in general orders from these headquarters as belonging to a distinguished class no longer eligible to compete for these honors without special permission from the commanding general of the army.

Post commanders will send only enlisted men to represent companies at contests for places upon department teams, but department commanders may select (upon recommendations by post commanders) two commissioned officers from each regiment in the commands, to compete. Staff officers may be allowed to enter department competitions in the discretion of department commanders.

At all annual competitions for prizes and places upon teams, distances will remain as heretofore, but the total of the two days' score of the three fired will determine composition of teams. Preliminary practice will not exceed five days for department contests or three days for division and army competitions. Individual skirmish matches will always be held at these meetings, and scores will be carefully recorded and announced. This very important kind of target practice will not be neglected. A medal will be awarded to the skirmisher making the best individual score at each of the annual competitions for department, division and army prizes.

DOMINION RIFLE ASSOCIATION.

Ottawa, Feb. 13.—The annual meeting of the Dominion Rifle Association was held this morning in the Railway Committee room of the House of Commons. There was a large attendance. The annual report of the association was submitted in printed form and accepted as read. This report speaks of the sending to England of the Wimbledon team last year under Lieutenant-Colonel Otter. The Kolapore Cup was lost by the team by eighteen points, the competition having been with the Martini-Henri rifle, to the use of which Canadians were not accustomed. One hundred Martini-Henri rifles has been secured on loan from the Home Government through intervention of Lieutenant Colonel Otter, and would be given out to the Provincial Associations to be used by the members. Among the prizes offered at the last meeting of the association was "The British Challenge Shield," which was presented through the Marquis of Lorne by the auxiliary forces of Great Britain. The changes in the ownership of part of the grounds on which the ranges at Ottawa are make it necessary, in the opinion of the Council, to throw the butt back 100 yards, so that all firing points may be brought within ground leased by the Government.

The question of funds was touched upon, the Council reporting that there there was no certainty of income, and therefore no basis on which can be determined the amount that may be prudently offered in the prize list. The cost of working the annual meeting is about $3,500. The balance of the Government grant over the expenses of the Wimbledon team is only $2,250, and this is all that can be depended upon with any degree of certainty.

In view of these facts the Council feel much anxiety as to the general future of the association, but trust that the Government may be induced to restore the grant to its original sum of $10,000, and thus render possible the continuance of the work in which they are engaged, as they believe, with no slight benefit to the militia force of the country.

Lord Lansdowne, responding to a vote of welcome, said: Mr. President and gentlemen—It is a source of the greatest satisfaction to me to know that your members were anxious that I should succeed to the place in this association which was occupied by my predecessor, Lord Lorne. I regard it as a recognition of the fact that this association is doing a work not only of great material interest from the point of view of the Dominion, but of great imperial importance as well. I wish I could say that I felt that I could bring to the performance of these duties something of Lord Lorne's ability to perform them. Lord Lorne was not only a generous and consistent supporter of the association, he was not only a strenuous advocate of its claims upon all occasions, but he was a practiced and experienced rifleman, thoroughly conversant with all matters of business with which you are concerned, and able to bring to your council a great deal of practical thoughtfulness and sagacity. My own acquaintance with rifle shooting goes back to, I am afraid, a rather distant date. I was one of the school boys who shot in the first Eton eleven at Wimbledon the first year that the prize was given there; and I am ashamed to say that after that my military ardor somewhat evaporated, and will require a good deal of resuscitation now. I am very glad to see, sir, from the report which lies upon the table that I am called to the office of patron at a moment when, upon the whole, the position and prospects of the association are such as to give us cause for congratulation. I believe it is taking more and more hold upon the people of the Dominion, and I have no fear that during my connection with it it will continue to hold its own. But there is one respect, and I think one only, in which, perhaps, the position of the association is not quite so satisfactory as we all of us desire, and that is the paragraph in the report which touches upon the delicate and important question of finances. Now, as to that, we know, of course, that the income of the association is derived partly from private sources and partly from the support which the Dominion Government has thought fit to extend to it. As to those private sources of income, it seems to me that our efforts should be directed mainly to this, to secure for the association from as many quarters as possible not so much a very large measure of support as a constant source of income. (Applause). If we could prevail upon our friends to give us not a very magnificent subvention upon one or two occasions, but to promise us for a term of years such an amount of assistance as will give us something like an assured income, I think we should stand upon a financial basis more solid than that which we occupy at the present time. With regard to the other source of income, namely, that which we derive from the kind assistance of the government, I observe that the report expresses the highest hope that the subvention may be somewhat increased. I can only say this, that the moment being one in which I observe there is in the air a good

deal of mention of what is spoken of as "better terms," if the association is not very extravagant in its proposals under that head we should be very much gratified if it should be within the power of the government to meet those very moderate requirements. (Applause).

The new president, Hon. Mr Kirkpatrick, made the pleasing announcement that his Excellency, the Governor-General, had contributed $500 to the funds of the association. The announcement was received with applause.

The following gentlemen were elected vice-presidents:

For Ottawa, Lieut.-Col. Allen Gilmour, Ottawa; for Quebec, Lieut.-Col. Ouimet, Montreal; New Brunswick, Lieut.-Col. Hon. A. E. Botsford, Sackville; for Nova Scotia, Lieut.-Col. A. K. Mackinlay, Halifax; for Manitoba, Hon. M. A. Girard, Winnipeg; for British Columbia, Hon. W. J. Macdonald, Victoria; for Prince Edward Island; Hon. R. H. Haythorne, Charlottetown.

The election of some members of the council brought the meeting to a close.

The new council met this afternoon at 3 o'clock, and the following members of the staff were appointed: Chairman of the Council, Lieut.-Col. Hon. M. R. Masson, of Terrebonne. Executive Committee of Council: Major Tilton, Lieut.-Cols. Panet, Ross Bacon and White, Ottawa; D. P. Fraser, Montreal; Lieut. Macnachtan, Cobourg; Lieut.-Col. Macdonald, Ottawa; Capt. Mason, Hamilton; Major Blaicklock, Montreal; Lieut.-Col. Worsley, Kingston; Lieut.-Col. Gibson, Hamilton. Capt. Perley, Secretary; Capt. Costin, Ottawa, Treasurer. Finance Committee: Major Tilton, Lieut.-Col. Ross, Ottawa; Capt. Perley.

The council is composed as follows:

Ontario—Col. Gzowski, Major Mason, Lieut.-Col. Macdonald, Lieut. Macnachtan, Lieut.-Col. Otter, Lieut. Gourdeau, Lieut. Col. White, Lieut.-Col. Panet, Lieut.-Col. Williams, Lieut.-Col. Bacon, Lieut.-Col. Vance, Graveley, Lieut.-Col. Gibson, Capt. Casey, and Major Macpherson.

Quebec—Major Blaiklock, Lieut.-Col. D. T. Fraser, Capt. Prevost, Capt. Hood, Capt. Baifour, Lieut.-Col. Masson, Lieut.-Col. McEachern, Major E. Bond, Mr. Hall, M. P., and Lieut.-Col. Worsley.

New Brunswick—Major Tilton, Capt. Perley, Lieut.-Col. Beer, Capt. Toller, Hon. John Boyd, and Josiah Wood, M. P.

Nova Scotia—Maj.-Gen. Laurie, Mr. Stairs, M. P., D. B. Woodworth, M. P., Lieut.-Col. Bradley, Lieut.-Col. Bremner, and W. Macdonald, M. P.

Manitoba—Lieut.-Col. Scott, Hon. Mr. Royal, Lieut.-Col. Macdonald, and A. W. Ross, M. P.

British Columbia—Hon. Mr. Nelson, D. E. C. Baker, M. P., Hon. Dr. McInnis, and Lieut. Col. Ross.

Prince Edward Island—Major Dogherty, Capt. D. Stewart, Capt. Brecken, M. P., and Surgeon Malloch.

RANGE AND GALLERY.

BOSTON, Feb. 22.—Walnut Hill Rifle Range was crowded to-day by devotees of the rifle, all anxious to improve the beautiful weather. While the conditions were particularly pleasant for outdoor sports generally, the riflemen complained of a troublesome wind. A feature of the shoot was the presence of many gentlemen shooting military rifles, and rolling up excellent scores therewith. The best records of the day are appended:

WORCESTER, Mass., Feb. 22.—There was the regular field day at the Pine Grove Range of the Worcester Rifle Association; by reason of the wind which was had the scores were not as large as on some former occasions. The prize winners and their scores were as follows: The first event was the Creedmoor match, each man had five scores of seven shots with a possible 175.

A C White	32	32	33	34	31—	162
S edman Clark	31	33	32	21	32—158+3=161	
M N Joyce	31	31	29	33	32—155+3=158	
A L Rice	31	31	31	30	30—152+6=158	
J N Freemon	31	30	30	31	30—152+6=158	
C A Allen	29	29	30	31	29—148+3=151	

The next was the American Decimal Match with 5 scores, 9 shots, and a possible 350.

A C White	60	58	56	61	62—	297
C A Allen	58	53	54	64	56—285+10=295	
M N Joyce	59	57	48	50	54—268+10=278	
M Fergusson	43	41	42	36	54—216+15=231	

The third event was the American Decimal Rest Match, with 5 scores, 7 shots, and a possible 350.

J L Thomas	55	61	57	61	64—298	
Jo n Jay	56	52	60	63	65—295	

NEW BEDFORD, Mass., Feb. 22.—In a 200yds. rifle match to-day, between teams of the New Bedford City Guards, Company E, 1st Regiment, and the Cunningham Rifles, of Brockton, Company I, 1st Regiment, the former won by four points. The score stood, in a possible 100:

New Bedford City Guards.		Cunningham Rifles.	
Sergt Greene	58	Sergt Battles	57
Sergt Howland	62	Private Wadsworth	51
Sergt Pope	56	Private Tilton	70
Corp Daniil	49	Private Tribou	53
Private Barnum	62	Private Packard	58
Private Paine	61	Private Winslow	58
Private Jennings	56	Private Potter	58
	404		400

NORRISTOWN, Pa.—Match shot on Washington's Birthday, weather conditions favorable, although a moderate breeze was blowing across the range almost at right angles, and making it very difficult for some of the marksmen to keep on the target. The distance was 100yds. The majority of the marksmen shot lying on their backs, no artificial rest being allowed. A. B. Parker was very unfortunate, his rifle breaking in the first match. E. A. Leopold won first prize in every match, as the following summary will show. Each marksmen fired five shots in each match, and each shot was measured from the center of the bullet hole to the center of the bullseye. The total distance of the five shots being the shooters' string, and the shortest string to win:

First Match.—E. A. Leopold 7.01 inches, J. S. Pennypacker 11.04 inches, Mr. Johnson 23.01 inches.

Second Match.—E. A. Leopold 3.69 inches, J. S. Pennypacker 11.41 inches, Mr. Johnson 18.51 inches.

Third Match.—E. A. Leopold 4.48 inches, J. S. Pennypacker, 10.06 inches.

Fourth Match.—E. A. Leopold 5.06 inches, J. S. Pennypacker, 6.41 inches.

Mr. Leopold used a Maynard Creedmoor rifle, and put 10 out of 20 shots in a four-inch bullseye. Mr. Pennypacker used a Winchester repeating rifle 45-50, with peep and globe sights and spirit level, and was given an allowance of half an inch per shot in the second match, and one inch per shot in the third. Mr. Johnson used a muzzleloader with peep and globe sights and hair trigger, and received an allowance of one inch per shot in the second match, and one and one-half inches per shot in the third match. The shooting of the winner in the second and third matches is said to be the best on record for this style of shooting in this section of the State.

SPRINGFIELD.—The Springfield Rod and Gun Rifle Club went down to Collinsville, Conn., yesterday to shoot the first of a series of team matches with the Canton Club, and came off victors by a score of 495 to 480. The teams consisted of five men each, and the conditions of the match were ten shots each on the Massachusetts target with a possible record of 120. The Canton Club are said to have been surprised to find Assistant Manager Farrow of the Bullard Arms Company pitted against them, not knowing that that remarkable shot had taken up his home in this city. The boys were treated very handsomely by the Collinsville people, being met at the depot by a committee and escorted to the Valley House, where a first-rate dinner was provided for both clubs. The next match will be shot about Fast Day. The score:

The Springfield Club.

M W Bull	7	10	9	12	9	10	10	9	9	10—95
H K Cooley	10	12	10	10	10	11	9	9	11	8—100

C B Hull	11	7	9	11	10	9	10	10	9	9—95

Mr. Farrow shot one of the new Bullard repeating rifles. They were very bountifully entertained with a substantial lunch, and a very fine dinner.—MRS. W. MILTON FARROW.

ZETTLER'S GALLERY.—Ten shots per man, possible 120. Capt. Fitz's Side—T. Fitz, 116; A. Lober, 116; D. Miller, 112; H. Oehl, 114; C. Judson, 117; H. Holges, 116; T. C. Noone, 111; total, 802. Capt. Zettler's Side—B. Zettler, 114; M. Dorrier, 117; C. Zettler, 114; J. T. Norris, 108; J. Levy, 114; J. H. Brown, 116; V. Steinbach, 116; total, 799.

Regular shoot. Feb. 19, 12 ring target. 10 shots per man, possible 120: A. Lober, 116; C. Judson, 116; D. Miller, 110; T. C. Noone, 105; M. Dorrier, 117; M. Ensler, 113; P. Fenning, 114; H. Holges, 113; V. Steinbach, 116; C. G. Zettler, 113; B. Zettler, 109; H. Oehl, 114. N. D. Ward, 103; H. Puckhaber, 99.—N. D. WARD, Secretary.

GARDNER, Mass., Feb. 20.—The Brattleboro Rifle Club of Brattleboro, Vt., are expected here soon, when a match will be shot with the Gardner Club at Hackmatack Range. At the last meet at the range the attendance was light. The American decimal target was used; distance, 200yds.; shooting off hand. Out of a possible 100 the following is the score:

G F Ellsworth	9	8	9	10	9	9	9	10	10	9—92
I N Dodge	9	9	10	7	10	9	6	10	9	7—86
George Fordyce	6	9	10	9	9	9	4	9	9	7—84
D I Newman	9	10	7	6	7	7	9	9	9	10—88
S B Hildreth	8	9	9	9	8	7	9	6	6	9—81
W Lewis	9	6	8	7	10	4	10	8	6	5—73

BROOKLYN, Feb. 20.—The following gentlemen were elected officers of the Brooklyn Amateur Rifle Club for the year 1884: President, C. E. Tayntor; Vice-President, M. B. Hull; Secretary, J. S. Case; Captain, G. Joiner.—J. S. CASE, Secretary.

BULL'S HEAD RIFLE CLUB.—Thursday, Feb. 14.—12-ring target, possible 120; M. Dorrler, 117; A. Lober, 117; G. Zimmermann, 113; C. Rein, 113; H. Gunther, 113; H. Kruger, 112; V. Steinbach, 111; H. Hackmann, 106; H. Zubiller, 102; S. Mehrbach, 100; J. F. Campbell, 99; G. Brueck, 93.

Thursday, Feb. 21, 12 ring target, possible 120: C. Rein 118, A. Lober 117, S. Mehrbach 115, G. Zimmermann 115, M. Dorrier 115, J. F. Schroeder 112, J. F. Campbell 111, J. Schneider 111, G. D. Johnson 105, B. Walters 94.

A QUERY AND SOME FACTS.—Milford, Mass., Feb. 11.—I have a Sharps long-range rifle in perfect order and condition and an extra fine shooter, but have no time nor range for practice, and would like to know from some readers of FOREST AND STREAM what effect it will have to take four inches off the end of the barrel. It is now 34 inches long, and I would like it better for general shooting if it was only 30, but dislike to run the risk of spoiling its shooting by cutting it off. Have any readers ever done this with this kind of rifle, and what was the result? While I am writing of rifles let me say a word about bullets. In moulding some .32-caliber Winchester bullets a short time since, I was troubled to get perfect ones, and as an experiment, I melted with the lead a silver ten cent piece in enough lead to make about two hundred balls, and a handsomer lot of bullets I never saw, except nicely swaged ones, and upon testing them for weight I took some twenty five from the lot hap hazard, and the extreme variation was only one grain by very careful testing. I kept the moulds clean and very hot. Let some one else try this and report. I believe these balls will shoot as accurate as swaged ones. At sixty yards, using a Maynard 24-inch barrel, open sights, Winchester .32 caliber shell, 29 grains Laflin & Rand No 6 powder and this bullet, I fired five shots, and four of them broke into the same holes, much to my surprise, as I had little expected it from moulded bullets.—C. A. S.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

HISTORY OF THE WORCESTER CLUB.

TEN years ago the present month a few of the more prominent and enthusiastic sportsmen of this city began to agitate the formation of a sportsmen's club. The project met with favor from the very outset, and after being discussed informally for a few days as one and another of the intended parties happened to meet, a preliminary meeting was called at the office of one of our business men, whose whole soul was in the scheme. The meeting was largely attended, and was composed of our prominent business men. The veteran sportsman and honored citizen, John Boyden, Esq., was called to the chair, and well do I remember his characteristic speech on that occasion.

He had been in delicate health for a long time, and it was probably the first evening he had spent away from his home in many months. His whole soul seemed fired anew on meeting the large company of his fellow citizens who had come together to talk of the subject that had been the ruling passion of his life. The formation of a club and what should be its principal objects was fully discussed, a committee on constitution and by-laws was chosen, and a liberal amount subscribed by those present to defray the expense of printing, etc. Success was assured from the beginning, and when on the first Wednesday evening of the following month we met and chose officers and adopted our constitution and by-laws, we were able to present a membership roll of gentlemen that no one need feel ashamed to be identified with. We have, and have always had, a large number of members who never shoot a gun either at the trap or in the field. They are prominent business men who feel a local pride in the organization, and who are quite willing to pay their annual dues for the social privileges which the club affords.

As soon as the club was fairly organized we opened the commodious club room, over the First National Bank. It was a well-furnished and attractive room, supplied with all the sportsmen's papers besides other reading matter, was always comfortable and neatly kept, and open day and evening for the use of the members. But somehow it never seemed to take very well, and it proved a very expensive luxury. After keeping it open three or four years it was decided that the money expended could be better enjoyed in some other way, and the room was given up and the furniture sold at auction. Since then the club has held quarterly meetings at the Bay State House.

Ours has always been a live club. While we have never been unmindful of the all important matter of game protection, we have also provided plenty of amusement for the members. When our club was scarcely a month old we held our first field day, using the old gyro pigeon. We purchased several traps and a large stock of the tin birds, but after using them a few times the members grew tired of them, and we were glad to sell our stock at a large discount to a young club in a neighboring town. We had not secured permanent shooting grounds when we made arrangements for our first pigeon-shooting tournament, which was held at Barber's Crossing. This shoot was a grand success and was followed by another, which was held on the Full Moon Trotting Park, and this closed our first year's out-of-door festivities.

As spring opened and we commenced our second year we secured permanent shooting grounds on the Harrington place near Jordan Pond, and erected thereon a club house and pigeon coops at an expense of over three hundred dollars. Here we enjoyed many a pleasant field day till finally compelled by State legislation to cease pigeon shooting.

Next we gave our attention to glass balls, using the old Bogardus ball and straight away trap. Then came the Card rotary which had a long run, but after a while it was considered too easy, and one of our members, Mr. C. B. Holden, invented a trap which came into general use in New England and which I think has never been excelled for glass ball shooting. The members of our club have shot a great many team matches, a large majority of which they have won. The first of these matches was a series of three with the Marlboro Club. The first meeting was in Marlboro, and when the Worcesters walked to the score they had never before seen a ball thrown from a rotary trap. We lost this race but won the next two. Afterward we generally met the Marlboros in a friendly contest once a year as long as that club existed. We challenged the New Haven Gun Club and met them in that city, the match resulting in a tie. The return match was shot in Springfield and won by the Worcesters. When the State Glass Ball Association was formed ours was one of the first clubs to move in the matter. Previous to the last annual tournament the State Association has each year offered two champion badges for glass ball shooting, one for teams of five men, the other for the individual championship, these badges to be held by the winners through the year provided they were able to defend them successfully, each being subject to challenge once a month. The Worcester Club turned in both these badges last year.

The Ligowsky Clay-Pigeon Company forwarded a beautiful badge for the individual championship to be contested for at the last annual tournament, and the association provided a very handsome team badge for the clay-pigeon championship. The Worcesters won the team clay-pigeon badge, and the Ligowsky badge was won by H. W. Eager, of Marlboro, who is a member of the Worcester Club, and who defended his trophy on our grounds. He met five contestants, and finally lost it to Mr. Negus, of Fall River. Our vice-president, Mr. W. S. Perry, went after it recently and brought it home.

Both the team and individual glass-ball badges had been gathered in, and Mr. Perry's victory made the list complete, and for a few days the whole four adorned the show-case of Comrade Shepard, the local dealer in sportsmen's supplies. Last Thursday Mr. Holden lost the individual glass-ball badge to B. Moses, of Springfield, with the close score of 45 to 46 in a fifty-ball race. Mr. Perry is to make an effort to reclaim it on Saturday, March 1, but it would be rather remarkable if the whole four should again be held by one club. Mr. Perry has shot many notable matches for money, both at live birds and glass balls. Among those most worthy of mention are the matches he shot with Mr. W. H. Sheldon, of Providence, R. I. The first was for $100 a side, 100 birds per man, and was shot in Providence in a pouring rain storm, and won by Sheldon. Mr. Perry felt his defeat keenly, and offered to make another match for $250 a side, to be shot on neutral grounds. His proposition was accepted, and the match was shot on the grounds of the Tremont Club at Readville. A large and interested audience was present, among whom were Captain Bogardus and Ira Paine. It proved to be a great race and created much comment in shooting circles. Perry won the match with the wonderful score of 95, tieing Captain Bogardus for the best record under same rules. Sheldon also shot a splendid race, scoring 87 birds. It was claimed by Sheldon's friends that Perry had out-shot himself, and had no licence to beat Sheldon, and announced themselves ready to back their man for another race for the same amount. The proposition was accepted and the third match was shot in Providence and won by Perry by one bird.

About five years ago we were compelled to look for new shooting grounds. We secured a beautiful spot near Coal Mine Brook, on the shores of Lake Quinsigamond. Our old club house was moved to the new grounds, and for a time did good service, but the club began to feel the need of better quarters, and the past season a large two-story house has been erected, with dining hall and all the appointments necessary for comfort. I think it is safe to say we now have as good accommodations for trap-shooting as any club in New England.

Our next annual meeting, which is also our tenth anniversary, occurs on the first Wednesday in March. Just what the club will do to celebrate the event has not been decided. That the uninterrupted harmony and good feeling which has prevailed throughout these entire ten years may be ours in the years to come is the sincere wish of E. SPRAGUE KNOWLES.

WORCESTER, Mass., Feb. 14, 1884.

[The above sketch of the Worcester Club is very entertaining reading. We should be pleased to publish like sketches of the history of other clubs].

A NATIONAL ASSOCIATION.

Editor Forest and Stream:

A national association; such as it is proposed to organize at Chicago next May, might establish a uniform code of rules to govern all contests of shooting throughout the country, and it might institute a series of annual tournaments.

I heartily approve of the formation of such an association, and deem it advisable and necessary, not only for the objects above named, but for many others which will naturally come before it. Certainly the yearly fixing of the date and place of the annual tournament, and the care of all arrangements for the same, would be a part of its duties.

Also, I should wish that it be endowed with a great prerogative, to wit, that it be constituted a board of appeal and final arbitration concerning all matters of dispute between clubs (who sign its articles), as also between such clubs and any member thereof who may deem himself to have suffered wrong by any decision of said club.

It would also be within the province of such an association to provide a badge for the Flight Championship of America, and make regulations for the winning and holding of the same, thereby giving us a championship with a paternity.

All these things would properly come before the meetings of such a body, and I feel safe in promising that our little club from Exeter, N. H., will be represented there, and will cheerfully sign and abide by all rules and regulations which the wisdom of the convention shall declare just and equal.

J. WILLIAMS (of Exeter Sportsman's Club).

EXETER, New Hampshire.

THE CLAY-PIGEON TOURNAMENT.

Editor Forest and Stream:

The following clubs have thus far remitted $1.00 initial entrance fee, Championship match, First International Clay-Pigeon Tournament, May 20, 1884. The numbers indicate the respective order of choice as to time in being called to the score; the list will be published periodically as additional entries are made:

1. Aug. 17, 1883, Tallahassee Gun Club, Tallahassee, Fla.
2. Sept. 4, 1883, Cincinnati Independent Shooting Club, Cincinnati.
3. Oct. 19, 1883, Vicksburg Gun Club, Vicksburg, Miss.
4. Nov. 3, 1883, Exeter Sportsmen's Club, Exeter, N. H.
5. Dec. 15, 1883, Lincoln Sportsmen's Club, Lincoln, Neb.
6. Dec. 26, 1883, Niagara Gun Club, Niagara Falls, N. Y.
7. Dec. 26, 1883, Narragansett Gun Club, Providence, R. I.
8. Jan. 13, 1884, Oshkosh Shooting Club, Oshkosh, Wis.
9. Jan. 14, 1884, Medfield Sportsmen's Club, Medfield, Mass.
10. Jan. 30, 1884, Cleveland Gun Club, Cleveland, O.
11. Feb. ', 1884, Worcester Sportsmen's Club, Worcester, Mass.
12. Feb. 13, 1884, Capital City Gun Club, Washington, D. C.
13. Feb. 15, 1884, Peoria Shooting Club, Peoria, Ill.

CINCINNATI, O., Feb. 23. LIGOWSKY C.P. Co.

SIZE OF SHOT FOR CLAY-PIGEONS.—Waterloo, Iowa.—*Editor Forest and Stream:* In a recent issue, you requested some of your readers to give their experience with clay-pigeons, with a view of determining the size of shot most suitable for the demolition of those targets. I had used No. 9 soft shot in shooting glass balls with excellent results; and when I was invited to attend my first clay-pigeon match last spring, having never seen a clay bird and supposing them no harder to break than a ball, I loaded my shells with No. 9. I found the bird much easier to cover than I expected, but the "tailers" and a number that went quartering away failed to respond; and at last I went out and picked up several and invariably found shot marks on them. I was using a full choke 12-bore gun, 4 drams power, and 1¼ ounces shot. I immediately made up my mind that No. 9 shot was not the thing, and at the next match used No. 8 soft, and although I was more successful than in the previous match, I picked up several missed birds with lead on them. I next tried No. 7 chilled shot, and it "simply paralyzed" them. I have used that size since, and consider it the proper one, but if a man's gun makes a better pattern with No. 6, I would advise him to use that size. I have seen clays with the marks of as high as seven pellets on them, No. 8 shot, that were not even chipped. A clay-pigeon looks like a good-sized target, but the flat surface presented is very small, and when it is skimming through the air, swiftly rotating, unless the pellet hits it squarely, it is very apt to glance off, and glancing pellets won't do the business. I don't believe any better substitute for the live bird exists than the clay pigeon, and practice with them better fits the sportsman for the field.—J. C. H.

NEWTON, Mass.—On the grounds of the Newton Rifle Association at Newtonville Friday, there was a clay-pigeon match between teams of three from the Newton and Wellesley clubs, which was won by the former by one bird. There was also a free-to-all match, three prizes being offered, in which the following scores were made:

W O Edmands	1110111—6	1011111—6	1111111—7—19
M L Pratt	1111011—6	1110111—6	1011111—6—18
E B Towne, Jr	1011111—6	1111000—5	0110111—5—16
Geo Linder	1111011—6	1101101—5	0101111—5—16
J E Hills	1100100—3	1011001—4	1111111—7—14
Dwight Boyden	0110101—4	1110001—4	0101111—5—13
D S Short	1001110—4	0101001—4	0101101—4—12
G L Bullens	0011100—3	0100101—3	0110011—4—10
E B Hitchcock	0010110—3	1110110—5	0001100—2—10

NEW BEDFORD, Mass., Feb 22.—The New Bedford Gun Club shot to-day for the Pierce medal, 10 balls and 10 pigeons each. The score: Andrew Butts 16, Herbert P. Bryant 15, Philip D. Slocum 15, John B. Hussey 13, George R. Stetson 8. Butts has won six times in the last seven contests for the medal, which is to be given to the member of the club winning it the most times in one year.

WORCESTER, Mass., Feb. 21.—To-day was the regular field day of the Worcester Sportsmen's Club, at Coal Mine Brook range. Among those present were D. A. Dickey, J. Nichols and J. C. Field, of Boston; G. G. Tidsbury, J. H. Cole and J. Fluff, of Ashland; C. H. DeRochmont, of Newburyport; B. Gardner, of Albany, N. Y., and John E. Long, Detroit, Mich. The first event was a challenge match at clay pigeons, for the individual badge of the Massachusetts Association.

held by W. S. Perry, of this city, his opponent was D. A. Dickey, of Boston. The judges were C. D. DeRochmont, of Boston, and Major L. G. White, of Worcester, with G. G. Tidsbury, of Ashland, as referee. Each man shot at 50 pigeons, by the rules of the Massachusetts Association, in strings of five each. The following is the score:

Perry.....1111111111111111111101111111111111111111111—45
Dickey.....1111010001001111111101100000011111101101011001—31

After a lunch there was shooting by members and visitors, but no records were given, although there were ten events, shooting for sweepstakes.

MICHIGAN GUN CLUB.—Detroit, Feb. 23.—The recently organized Michigan Gun Club and Game Protective Society had their first regular trap shoot upon Washington's Birthday—Feb. 22. The weather was most disagreeable. A snowstorm raged during the afternoon, and the wind blew fiercely. Notwithstanding the unfortunate weather a large number participated in the shoot, and it would seem that trap-shooting in Detroit will soon, as of yore, become popular. The scores would have been, under a different condition of the elements, far better:

Thomas Wood's Side.

F Curtis	1000010111000010010000101— 9

Tie, Tinker 11111, Cary 11101. Mr. Tinker wins.

St. Valentine's Day was observed in a fitting manner at the grounds of the Narragansett Gun Club, there being three events—first, the club badge match at pairs of doubles (clay-pigeons); second, a postponed match for the Ligowsky State badge, and the third, the regular weekly shoot for the last named badge, the two last shoots being at twenty-five single clay-pigeons from five traps. The weather was cloudy and dark, with a heavy wind, and the scores as a consequence rather below the average. The following is the score:

Club Badge Match.

E W Tinker	11	00	11	10	10	01	10	01	01	11—12
C C Gray	00	10	00	10	00	00	00	01	01	00— 5

Mathewson	0101011101110010100111111—16

Tie—Tinker, 10100; Luther, 10000. E. W. Tinker wins badge for fourth time.—W. H. S.

EAST PROVIDENCE, R. I., Feb. 19.—On Tuesday there was quite a company at the grounds of the Watchemoket Gun Club, Riverside being well represented, and quite a delegation being also present from the Narragansett Gun Club. The day, though cloudy, was quite favorable for shooting. For the clay-pigeon silver cup the following was the score, best out of twenty: ten single rises and five doubles; singles, 15yds. rise; doubles, 12yds.:

E W Tinker	1	0	1	1	1	1	1	1	1	1	1	0	1	1	0—16
Isaiah Barney	1	1	1	0	1	1	0	0	1	1	0	1	1	0	1—16
E S Luther	1	1	1	1	1	1	1	1	1	0	1	0	1	1	1—17
L S Winchester	0	0	1	1	1	0	0	0	1	1	withdrawn.				
Smith Shaw	1	0	1	1	1	1	1	1	1	1	withdrawn.				
John Case	0	0	0	1	1	withdrawn.									

The temporary possession of the cup was awarded to E. S. Luther. For the glass ball cup the following was the score, best out of twenty; 18yds. rise, from a Holden rotary trap:

George Barney	1	0	0	1	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1—17
E S Luther	0	1	withdrawn.																	
Isaiah Barney	0	0	1	1	0	0	0	1	1	0	1	0	1	1	1	0	1	0	1	0—10
L S Winchester	1	0	0	1	1	1	1	0	1	0	withdrawn.									
Smith Shaw	1	0	1	0	1	1	0	0	0	0	withdrawn.									
John Case	0	1	0	0	1	withdrawn.														

The cup was awarded to George Barney for the second time.

MALDEN GUN CLUB SHOOT.—On Feb. 23 several members met at Wellington to contest for the first and second class solid gold medals for the fourth time. The rain storm during the shoot was very heavy, but nothing daunted, the clay-pigeon annihilators peppered the featherless birds as well as they were able in so inclement weather:

First Class.

T C Field	1110110111101110111—16
J Buffum	1111010000100101110—13
F Loring	1010111110010010110—12

Second Class.

A F Adams	0111101101101111001—14
J Nicholls	0111100111101001110—13
E J Brown	0111001010101011010—10

There are twelve contests for the Club's medals, which begun in January and end in June. The regular badge days are the second and fourth Saturdays of each month, showing that four contests have already taken place and will run through the ensuing months in *seriatim* until the fourth Saturday in June, when the fortunate Nimrods who are then declared winners the greatest number of times can proudly wear them as their own *ad captandum*.

Those who have already won in the contests for the first-class medal are: T. C. Field 2, J. Buffum 1, F. Loring 1. Second class: A. F. Adams 3, E. J. Brown 1. After the contests, and in the pouring rain, the shooters began to merrily bang away at the motherless birds, as they were gracefully propelled from Ligowsky's admirable trap, like a beautiful and festive quail as she swiftly cleaves the air, and then suddenly drops on *terra firma* to hide from the gunner's luckless aim, crying out to her mates "more wet! more wet!" After a comparatively enjoyable time in wet clothes the sportsmen took train for home, to meet again on Malden Gun Club's spacious grounds the next tournament day, March 1, when it is expected that a goodly number of clay-pigeon slayers will be present to enjoy the interesting programme of events.—T. C. F.

LEATHERSTOCKING CLUB.—Oswego, N. Y.—At a recent glass ball shoot on the fort ground, the boys had a pleasant time. Some fine scores were made. Mr. Ed. Plank walked to the front in good shape, and accomplished the difficult feat of smashing 28 balls straight (thrown from a Card revolving trap) with his new 12-gauge gun. The members of our Leatherstocking Club are wide awake this season, and the prospects are that they will make it interesting for the glass balls and pigeons.—DAN.

BRIDGEPORT, Feb. 14.—Scores of second shoot for champion clay-pigeon badge of Connecticut, shot at Bridgeport, Feb. 13, in a heavy fog. Some of the time we could not see the trapper. Next shoot takes place at Wallingford, March 12, as they won this time:

Bridgeport.

David Smith	1110101010101010100110011—16
E Laugdon	1111111110100011101101101—18

BOSTON GUN CLUB—Third Tournament at Clay Pigeons, Feb. 20.—Weather conditions of the most unfavorable kind, and prevented the meeting being so well attended as previous tournaments. The third tournament at Wellington, under the auspices of the Boston Gun Club, was held yesterday. Representatives were present from the Brockton, Exeter, Newburyport, Massachusetts, Middlesex, Worcester and Long Island gun clubs, and the shooting, considering the weather conditions, was good. The following are the results:

First sweep (7 clay pigeons, 18yds. rise)—D. Kirkwood won first, C. Henry second, G. W. Crouch and C. H. Gerrish, even, third.

Second sweep—D. Kirkwood and C. Henry first, Gerrish and Crouch second, Allen third.

Third sweep—Henry and Kirkwood first, Crouch second.

Fourth sweep—Henry and Gerrish first, Kirkwood second.

Fifth sweep—(only straight scores counting)—Gerrish took the pot.

Sixth sweep—Gerrish and Henry first, Kirkwood second, Allen third.

Seventh sweep—Henry and Kirkwood first, Gerrish and Emerson second, Sampson third.

Eighth sweep—Crouch first, Gerrish second, Kirkwood third.

Ninth sweep (three pair double birds, 15yds. rise)—Henry first, Gerrish and Emerson second, Allen third.

Tenth sweep (same conditions)—Henry first, Gerrish and Allen second, Emerson third.

Eleventh sweep (5 single birds, 18yds. rise)—Henry and Sampson first, Kirkwood second, Gerrish third.

Twelfth sweep—Sampson and Emerson first, Kirkwood second, Gerrish and Henry third.

Thirteenth sweep—L. E. Johnson first, Gerrish and Emerson second, Kirkwood third.

Fourteenth sweep—Henry, Gerrish and Kirkwood first, Sampson and Emerson second, Johnson and Crouch third.

Fifteenth sweep (5 single birds, 5 traps, 18yds. rise)—Gerrish and Johnson first, Emerson second, Henry third.

Sixteenth sweep—Gerrish first, Sampson and Johnson second, Henry and Crouch third.

Seventeenth sweep (5 single birds, same rise)—Emerson and Gerrish first, Chambers second, Henry third.

Eighteenth sweep—Gerrish, Kirkwood and Henry first, Sampson and Evans second, Nichols and Emerson third.

Nineteenth sweep—Emerson and Henry first, Gerrish and Sampson second, Nichols and Evans third.

Twentieth sweep—Kirkwood first, Sampson and Henry second, Nichols third.

Twenty-first sweep (miss and out, 21 yards rise)—Gerrish and Emerson divided.

Twenty second sweep (same)—Sampson won.

KNOXVILLE GUN CLUB.—For club medal at 15 clay-pigeons, 18yds. rise, fourth notch:

C C Hebbard	1101111111111110—13	Mead	0100001100111110— 7
A H Hebbard	1101011111111101—12	Ross	0001010100111100— 7
Armstrong	1111111010001111—11	Slocum	1010101000101000— 7
Dow	1100011111110010— 9	Wood	1000101001110000— 6

Jenkins	1111001010101010— 9	Misser	1010100000000000— 3
Worsham	1100111010010000— 7		

Election of officers—President, M. G. McClung; Vice-President, S. B. Dow; Secretary and Treasurer, Chas. C. Hebbard. Executive Committee: J. C. Duncan, S. B. Dow, F. W. Armstrong.

Yachting.

FIXTURES.

May 24.—Oswego Y. C., Opening Cruise.
May 24.—Boston Y. C., Opening Cruise.
May 30.—Knickerbocker Y. C., Spring Matches.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.
June 10.—Atlantic Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Hull Y. C., Club Meet.
June 16.—East River Y. C., Annual Matches.
June 28.—Boston Y. C., Ladies' Day.
July 12.—Hull Y. C., Club Meet.
July 12.—Boston Y. C., Second Club Match.
Aug. 9.—Hull Y. C., Club Meet.
Aug. 9.—Boston Y. C., Open Matches, all clubs.
Aug. 23.—Boston Y. C., Third Club Match.
Sept. 13.—Hull Y. C., Club Meet.
Sept. 13.—Boston Y. C., Second Ladies' Day.

THE ENDLESS TOPIC.

Editor Forest and Stream:

I notice in your last edition a letter from "Guest" in relation to the controversy upon the merits of Fortuna vs. Montauk. I was also a guest aboard Montauk in the Goelet cup race, and I wish also to correct a remark of yours which follows "Guest's" communication. You say that the wind shifted during the run in, thus favoring the windward boats, and compelling those to leeward to "pinch." That is a mistake. The wind shifted but once during the entire race and that was within fifteen minutes after the start, from that time it blew strong and steady throughout the day, never varying even half a point. The Montauk's superior position at the finish was due, in a measure, to the stretch she made to windward after rounding the Sow and Pigs Lightship, but it was equally due to the fact that she held on to proper sails only and did not attempt to carry, as Fortuna did, a small maintopmast staysail; it was also due to her superior pointing ability, which is easily seen when it is remembered that about midway, she passed to leeward of the Tidal Wave, and afterward widely winded her, although the Tidal Wave had been fully a mile further up in leaving the vicinity of the outer mark. To sum up that race on the facts, the Montauk beat the Fortuna on even sailing by minutes and 30 seconds on the thrash to windward, and had they been compelled to tack, would have beaten her more.

In regard to sailing "on edge," I wish also to say that the Montauk made, in my opinion, much the best weather of the two; that Fortuna inclined fully two degrees the most and pitched heavily many times, while Montauk was dry as a bone from the foremast aft, the entire day. This can be proven by five well-known yachtsmen, whom I will name if you desire it.

Again, you speak of Montauk's getting "near the capsizing point" vaguely. I don't know when she ever put her scuppers under, and I sailed on her, or in company all last season. The day that Grayling capsized Montauk let sheets fly, simply as a precautionary measure, not from any necessity, as her deck was not wet at any time.

While I am on the subject, I should like to say something on the question of keels vs. boards. Since the first appearance of cutters in this country, the above question has been discussed in every paper, the opinions of a large number of prominent yachtsmen quoted, and yet no satisfactory solution of the problem has been reached even in theory. This latter fact seems to be accountable to the very marked prejudices which have biassed the minds quoted. All have been either pronounced cutter or sloop men, and consequently entirely unable to see anything but the most apparent demerits of the antagonistic craft, and the very obvious merits of their own. I am a marine artist, and in my profession have had to do about equally with both types. I have studied both with equal closeness. I have painted the Bedouin for Commodore Rogers, the Madge for Mr. Loew, and others too numerous to mention here. My interests lie with both classes. I have witnessed all the races sailed in these waters during the past fourteen years, and have narrowly noted the results. I have no bias, no prejudices, and am disposed to speak impartially.

The question as to which is the superior type involves many other issues, and cannot be answered in a breath. Cutter men have spent large sums on their boats, and fitted them with every requisite. In all their races the cutters have shown immense superiority in equipment. Bedouin for instance has two forestaysails, two or three jibs, and at least four jibtopsails. No sloop has more than one of the two first named and never more than two of the last; at least that is the rule, and exceptions are very rare. Bedouin, in addition to her working gafftopsail has a small and a large sprittopsail; the former can be used over the working topsail to advantage on the wind. No sloop has anything like the sort. In a light breeze to windward the cutters can therefore set nearly one-third more sail than the sloops, and every inch of it can be trimmed flat, and made to draw. Their balloon forestaysails, No. 1 jibtopsails, and smaller sprittopsails are an immense advantage at such a time. The unwieldy club topsails or bulky jibtopsails of the sloops are almost back sails in comparison; hence the defeat of Gracie last fall in two races out of three. The sloops must be made to realize all this, and realizing, remedy it by equal expenditure and equipment. Again, the cutters that we have seen here have been about the best that could be built of that type; not so their opponents. We really have but three or four first-class sloops, and they are so in size only.

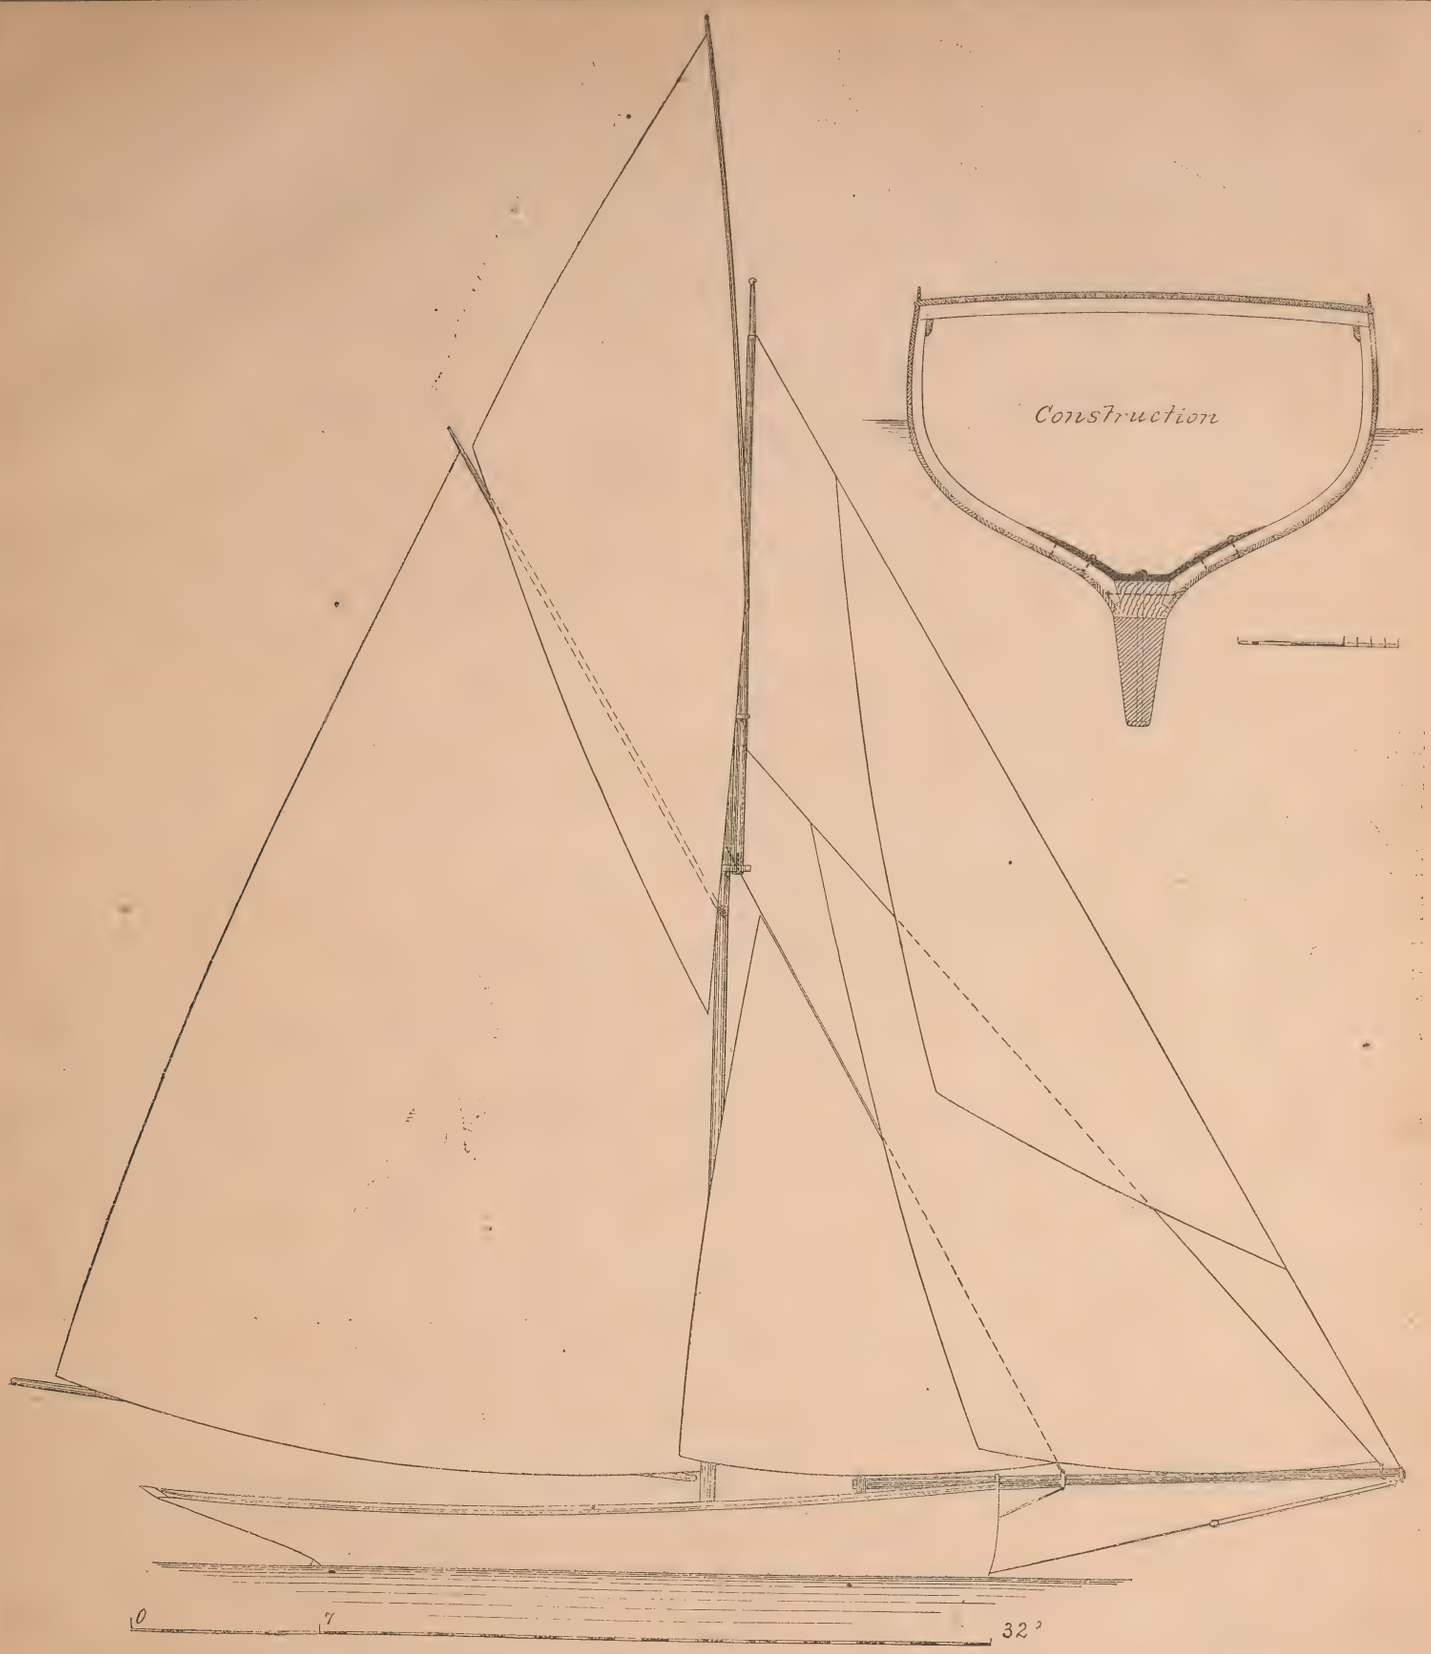
The Gracie's model is full of faults. Her bows flare so that a heavy swell sets her to leeward every time it hits; her sheer is so great and her stern so low that she carries tons of water on deck in a twelve knot breeze, retarding her progress materially. Fanny is so shallow and so immensely oversparred that a cap full of wind knocks her down to her scuppers. Mischief, ditto, and yet the cutters have not won the greater number of races; but they certainly will, if sloop men do not bestir themselves and build something in which the above noted obvious faults are remedied; and here lies the conclusion of the whole matter to the best of my judgment: A sloop 80ft. long by 20ft. beam, drawing not less than 5ft. of water without her board; having no flaring bows, and very little sheer; with strong bilge below and full equipment of sail aloft, would successfully overthrow every objection raised by cutter men, and fill every want known to their opponents. She would be deep enough and broad enough to carry a heavy racing rig in any kind of weather, and yet could anchor within a reasonable distance off shore in any of our yacht-frequented harbors. She could sail without any other pilot than a competent sailing master. The item of expense in ballasting would be no greater than the average sloop. She would require no awkward cabin house, but like the cutters, be flush-decked and much more roomy. Easy in heavy weather, owing to the depth and beam, fast in light airs owing to lack of weight, she would whip any cutter or sloop, now afloat, over either of the New York Yacht Club's courses, nine times out of ten.

F. BASSFORD.

No. 55 CONCORD STREET, Brooklyn.

[Mr. Bassford is very sanguine. He is very much in error in commending light weight for light airs. Experience has settled beyond any disputing the superior value of weight in light winds, providing the weight is put in proper form and not in a tub. Beyond this Mr. Bassford's conclusions are correct enough. They strike us in this way. To make a sloop a good sloop she should be turned into a cutter. She should have only four beams like the great majority of cutters. She should have the depth and rig and sheer and straight side of a cutter. But in place of a beneficial keel with low weight, Mr. Bassford would adhere to a small centerboard. It would speedily be discovered that low weights on the keel would make an abler boat, whereupon the board would disappear and an out and out cutter of tolerable beam would be the end of the story. To that we are now fast driving in practice. Still further on it would be found that a little more weight, that is displacement, is still a little better in light airs and in a seaway, and to add that weight without making a tub, the four beams would be cut down to four and a half, and the increase in displacement put in depth. In other words, Mr. Bassford would land right aboard another Bedouin, and it seems as though this might be done at once as go through all the steps over again which other people have already been through and which have culminated in the modern cutter. As it is, our correspondent proposes to go about nine-tenths of the whole thing at a bound, and the other tenth may be left to take care of itself, as the subject has been thrashed too bare to enter upon further repetition of what has been so often and extensively discussed in these columns. It is easy to find fault with the Gracie, now that she has been beaten by a cutter, and it is easy to build faster sloops on paper. But it is a very different thing to do it in fact. The Gracie always has been, and for the present still is, the queen of the fleet in America, subject to the Bedouin's permission. The latter holds the Bennett champion cup for single-stickers, won in fair fight in "our weather" and "our waters." No one can say whether she really is a good cutter or not. For all Mr. Bassford knows she may be a very slow one compared to regular racing cutters abroad. But we do know that Gracie tops the heap of the sloops. The cutters as a class in this country labor under immense disadvantage as to numbers from which to choose the best as a representative. One hundred sloops offer a better chance of a lucky hit than two or three cutters. Many of the latter are "compromises" of all sorts, sooner than the first ever designed by their authors, others from amateur hands, and with three exceptions, all sailed by persons new and green to such boats and their ways. Given one hundred Orivas, and is it not morally certain one could be picked from the lot which would be a good deal faster than the only representative in that class? For the one successful Vixen there are a hundred sloops which are comparative failures. Why should you expect so much more, even to the unnatural, the moment you touch upon cutters? Every kind of an abortion called a cutter must be capable of flying, or else the whole type is at once condemned. The reasonable view of it is this: Certain few cutters of unknown reputation have shown themselves about a match for the pick of our sloops. Given equal conditions for selection and it is certain that a good cutter can now be accepted as at least equal to the light drafts on the score of speed. Variations upon beam and depth will offer stiffness with deck and cabin room in excess of what can be had in Gracie's or Fanny's. The cabins are also much cooler. Better performance in light weather is a certainty, and as for draft, it is much of a bugbear at best in large vessels, and in small boats it is too small to be of any account for regular yachting purposes. In point of cost the modern beamy sloop of large displacement is more expensive and has a greater draft than the cutter. As for light displacement centerboard sloops, their day is past and it is no use referring to them in this connection. This is all old ground, and oceans of ink have been split in setting forth both sides of the question. The public has learned to discard light displacement and now the issue is practically reduced to a question of how much or how little beam. We take it that weight, keels and cutter rigs must be deemed already generally adopted and that in the future all good yachts will have those features incorporated, whatever their width may be. As to beam, it can be allowed an open issue, if desired, to be settled by further experience, though we are confident enough what the upshot of the experience will be. Of course we have no reference to makeshifts built to conform to exceptional surroundings or particular objects of limited application as far as the general public is concerned. We may recur to the Montauk's safety at sea later on. The charge that Fortuna heeled two degrees more than Montauk will keep no one awake at night. We have been informed that she was perfectly dry. It is also expected that a narrow boat with dead rise will see-saw more than a flounder bottom. It is one of her good points to lift readily to every thing.]

THE LAKE YACHTING ASSOCIATION.



WE learn with pleasure that the move for an association promises well, and permanent organization may soon be expected. The Toronto Y. C. have appointed Messrs. G. H. Duggan, W. H. Parsons, G. G. Evans and W. Dickson a committee to confer with other clubs in Canada and the United States, and a suitable call has been issued. In response the Oswego Y. C. has selected Commodore John T. Mott and Vice-Commodore W. B. Phelps, Jr., to attend the convention. The Bay of Quinte Y. C. has also signified its adhesion to the move, and Kingston and Cobourg are counted upon as well. Other clubs will soon be heard from. The chief objects of the association are enumerated as follows:

1. The confusion at present arising from the many different systems of yacht measurement and time allowance now existing would entirely be obviated by the adoption of a uniform system.

2. The dates of the regattas of the different clubs could be fixed by the executive body of the association in such an order that a yacht would be enabled to attend all the events in succession in the course of an ordinary summer cruise.

3. The establishment of a uniform code of signals might also be agreed upon.

You will confer a favor by bringing the matter before your club as early as possible, and forwarding the official result to the secretary of the Toronto Yacht Club.

THE DAISY.

THE rig of this cutter is of course large to keep pace with the bulk to be driven. The disposition of the area, however, is such that the mainsail, especially the boom, is kept within the control of two hands. The weight of the mast is well aft, and topmast can quickly be got rid of by housing or striking altogether for a passage. In respect to smartness the rig is so much ahead of the sloop that no one with half an eye for beauty would hesitate in his choice. The cutter is par excellence the rig of the world for speed and handiness combined, and it is only a question of time before it will displace the old Dutch river rig of the "shaluppe" altogether. It is fast becoming popular, and the Daisy's sail plan will give an idea of the ruling cut abroad, as her sails are from the loft of Ratsey & Lapthorn, of West Cowes.

SPARS.

Mast from end L.W.L.	10ft. 6in.
Rake of mast	0
Mast from deck to hounds	23ft. 6in.
Masthead	5ft. 6in.
Topmast, cap to shoulder	14ft.
Bowsprit outboard	15ft.
Bowsprit housing	5ft.
Forestay boomkin outboard	2ft. 6in.
Mainboom, over all	26ft.
Maingaff, over all	20ft. 9in.
Trysail gaff	9ft.
Spinnaker boom	30ft. 4in.
First topsail yard	23ft. 6in.
Second topsail yard	17ft. 6in.
Jackyard	15ft. 6in.

SAILS.

The outfit consists of the following: One mainsail, two sizes working foresails and one balloon foresail, three shifting jibs, one jack yard (club) topsail, one jibtopsail, two sizes yardtopsails, one jib-headed topsail, one spinnaker, one trysail; a total of fourteen sails with bags and covers for all. The dimensions of the rig illustrated herewith (mainsail, No 1 jib, large working foresail and No. 1 yardtopsail) are as follows:

Mainsail on luff	21ft.
Mainsail on foot	24ft. 3in.
Mainsail on leach	37ft. 3in.
Mainsail on head	19ft. 8in.
Roach to loose foot	16in.
Foresail on foot	14ft.
Foresail on luff	23ft.
Foresail on leach	20ft. 4in.
Roach to foot	8in.
Jib on foot	15ft.
Jib on luff	31ft. 9in.
Jib on leach	24ft.
Roach to foot	8in.
Area mainsail	542sq. ft.
Area foresail	145sq. ft.
Area jib	175sq. ft.
Area three lower sails	862sq. ft.
Ratio to square of loadline	1.38
Area per sq. ft. wet surface	2.69sq. ft.
Area per long ton of displacement	108.7sq. ft.
Center lower sails from end L.W.L.	13ft. 6in.
Center lateral resistance from L.W.L.	13ft. 11in.

The construction of the Daisy is shown by the section through midships. She has teak topsides and plank sheer and oak frame. All deadwood is through-bolted with copper and the hull through-fastened with copper. The metal floors are bolted through frame and bottom plank, and the frame heels are boxed in and through-fastened to the keel. Stem and post of British oak, sided 4¼in.; main keel, English elm, 8in. moulded; deadwood of oak; frame spaced 21in. apart between centers, sided 2in., moulded 2½ at heel and 2¼ at head, doubled throughout; floors of composition on every frame, the throat taking bolts of lead keel; beams of oak, sided and moulded, 3×2½in. Clamp of red pine, 3½×1¼in. Rudder stock of oak, blade of pine. Deck has covering board of teak, 4½×1⅛in.; planking of pine, 1½×2⅜in., caulked and payed with marine glue. Outside plank of teak, four strakes; garboards of elm, 1½in. thick. Bulwarks of teak and deck fittings of same. Fastenings of yellow metal and copper. Bolts of lead keel, 1¼in. diameter, driven from inside and screwed up from below, and countersunk and plugged. Bridght pine cabin. No paint, except the black of the sides and gold bead.

The cabin is very spacious considering the room taken up by the cockpit. The floor measures 3ft. 4in. between sofas, the latter being 6½ft. long by 26in. wide, with sideboards and pantry at forward end of 2ft. front. The cabin is entered from doors without a sliding companion, the space being occupied instead by a hatch 3½ft. by 2ft. Headroom is 5ft. and 6ft. under hatch. Forecastle is bulk bulkheaded off from cabin and entered by a sliding door. Has 2ft. 4in. floor, a berth on one side and w. c., sail rack, etc., on the other. A circular hatch 16in. diameter gives access from deck. The cockpit is 7ft. long and 2ft. 6in. deep. The yacht steers with a tiller of iron wrapped with hide. She is equipped in the very best and most complete manner. The chief articles being a Berthon folding dingy, a yawl boat of long flat floor, having great buoyancy and fine construction with considerable carrying capacity; water tank and brass-hooped deck breaker, box compass, floating compass with brass binnacle, barometer, clock, side lights, anchor and deck lights, flare-ups, red and green signal lamps, fog-horn, triangle to take place of bell, sea anchor, life belts, patent towing log, buffers for main sheet and anchor, fenders, mops, handlead, code signals in bag, brass rudder head cap, gratings for cockpit, also cushions, stove and belongings, pump, anchors with chain, kedge and two hawsers, swing table in cabin and the usual supply of the pantry and small stores.

RACING IN ENGLAND.

THE London *Field* has an editorial on the decline of racing and the paucity of entries, which the *Field* refers to some extent to the predominating type of racing cutter. In this we think the *Field* entirely mistaken. Lack of entries are due to the onesided measurement rule which handicaps beamy boats with a fictitious tonnage. Introduce a rule which treats such yachts as fair as the narrow racers of the day, and the entries will fill fast enough. The modern racing yacht is not the *cause* of the decline, but simply the effect of the Y. R. A. rule. Abolish a faulty rule and install one which does not bear upon any style, and the modern racers will quickly disappear if they fail to show themselves as fast as other forms. The *Field* attributes to modern racers the sins of the Y. R. A. tonnage rule, which is apt to mislead the hasty reader. The rule is to blame for small entries, and not the yachts it fosters.

HO, FOR THE HYGEIA!

WHO is going? Who will make up the fleet? Who will commission the first and load up with stores for a long and short hitch down the coast in southeasterly weather for "The Roads" and Norfolk town? A jollier cruise with three or four early birds for company could not be proposed. It is a nice little 250 miles down the coast, with the Delaware Breakwater half way and sundry harbors for refuge between. A taste of the briny, with a green one aboard now and then, and thousands of miles of sweep to the sea. A bold dash for little shavers, and something up brag about drifting into the Sound in midsummer zephyrs later on: "When we were on the passage down to Cape May." "As we squared away up the Roads and rounded-to off the Highjigger pier." "We took in the town, and a live, bustling port and a grand yachting harbor we found Norfolk to be." Shades of Farragut, but that would be great sport, indeed! It would be yachting in earnest, yachting as it ought to be. Manly work, athletic in its kind. Work for the head as well in the arts of seamanship and navigation. Work to be proud of, and no sickly infant's play. The real article and not its tinsel imitation. And Norfolk, with its gallant, hospitable society, growing shipping, its lines of steamers, coastwise and European, two live daily newspapers, its continental railroads, its ship yard, machine shops, compresses and big hotels, its clean, well-paved streets and blocks upon blocks of neat little villas, the Navy Yard, the U. S. Hospital, the old fort, the reminiscences of a few unpleasant years happily dimming in the flight of time, and Newport News, close by, with its docks and great depots, and Hampton School and the sunny Hygeia, with its swarm of guests from all parts, and big Fort Monroe, the Rip Raps, the River James; yes, and the luscious oysters and succulent clams, the early fruit and vegetable market, and all the great expanse of the noble and picturesque Chesapeake Sea stretching far away to the northward, inviting, enticing in its depth, beautiful bays, reaches and broad rivers—ah! what a yachting paradise there is but a short run to the southward, did yachtsmen hereabouts but know it and, knowing it, had they the grit, the old Norse spirit, the veritable love for salt water for salt water's sake we would fain do our best to inoculate into their lethargic and shrinking constitutions!

Ho, for the Roads! Who will clear for an early spring passage?

CONCERNING SAILS.

Editor Forest and Stream:

We notice an article on sails in last issue, giving a reason for putting heavy duck on yachts on account of the advantage gained in light airs. We believe that many of our yachts use too light canvas in their lower sails, but we do not think it is a detriment in light breezes, especially in our wide, light displacement, hard bilged yachts, which are so sensitive in a seaway that they slat the wind out of their lower sails, and nothing but the light sails aloft keep the lower ones steady. Without them the booms would swing in amidships with every roll to windward.

Now in regard to the sailing of cutters, there is no doubt they do sail fast, in light or heavy weather, but it is chiefly in light weather in comparison with our boats that they will distance them most readily. There are many reasons for this. One is that their sails stand at the proper angle, and simply because they obey the laws of gravity; it is impossible for them to swing in, if there be any wind at all, as the cutter's mast is plumb, or stayed a little forward of plumb also for the reason that the cutter, being narrow, must be sensitive to careen a plank or two before she feels the immense leverage of her lead keel. The weight of boom, gaff and sail is enough to do this. There are of course many other things which might be mentioned as contributing to speed outside of the sails.

We will try to get at the reason for cutters having heavier lower sails than yachts of similar size of different shape and arrangements in this country. Mainsails of cutters are extended by a powerful purchase at the clew, and the material has to be strong enough to stand it, otherwise it would pull out of shape and give in the center, therefore a bag, and as a consequence form an imperfect plane to scale to windward with. Sails have to be extended on the spars as well as hoisted taut, to be effective by the wind. This, we claim, is the chief advantage in a hose-footed sail. You extend it as well as hoist it taut, therefore get a rigid surface to let the breeze slip by the leach, without hills and hollows to retard it; but whether loose or laced to boom, in order to get the most good out of your sail, it ought to be hauled out taut on boom and gaff before sailing, if you desire speed to windward; and a sail should be made properly to admit severe hauling on head and foot as well as hoisting to a taut luff. There is a pet theory among a great many sailmakers—and they have influenced a great many yachtsmen—to haul out sails "hand taut," but hoist it, sway on it, get it up on the throat and peak. But be careful not to haul taut on head or foot, as you will spoil the shape of your sail. This is all very true if the sails are made so as to pull out of shape when hauled out. But sails should be cut to stand a smart pull on head and foot, and both should be come up with after sailing, especially in damp weather, if you wish to preserve the correct shape. Otherwise you will have a "dog's ear" at clew and earing in time and an unsightly sail.

We would not have the readers of your bright paper infer that we believe in heavy balloon sails, used for light breezes and running before the wind, and which have to be set and taken in quickly. But they should be made of light, *close* material. We favor light sails for light breezes, while heavy lower sails are an obvious necessity for all kinds of weather, heavy and light.

It is a well-known fact that topsails and staysail, in light weather, with a bobble of a sea on, keep the heavier lower sails and also the craft under them steady. Too little regard is paid to getting a perfect sail; and a great many yachtsmen do not know how to treat a sail. They appreciate and know more about this on the other side of the pond, but, presumably, time will work wonders on this side, when yachtsmen will learn to take more than a superficial look at things.

A good fit of canvas is of vital importance for speed or working to windward, and ought to receive the consideration of yacht owners just as much as the hull. JOHN H. McMANUS & SON.

BOSTON.

[We might add that ballooners are necessarily made light because set flying on light sticks with light staying, and that such sails can be kept as flat as desired by a pull on tack or sheet, whereas the lower sails once bent are more permanent in their sit, and not under such ready correction. Staying masts and topmasts with a pitch over the bows likewise offers a chance to cut sails with a broad head. As the head is the driving part of a sail in light winds, a broad flat stretch for the airs to operate upon is more effective than the quick, sack-like belly of a narrow sail.]

AN EASY ONE.

Editor Forest and Stream:

If it takes a schooner nearly 100ft. long on water line six weeks swinging at her moorings before venturing upon the tremendous undertaking of a three days' passage to Bermuda, how many days will she be cruising in one year? CURIOUS.

[Twenty-six days.]

WHY?—Why wait until the stereotyped June 1 before going into commission? Some of the best sailing of the year is to be had in April and early May. Cold, is it? Perhaps, and then it may not be as cold in April as we have known it in June. Suppose it is. Just what you want with a little exercise to keep comfortably warm. The dawdler whose conception of yachting amounts to sunning himself in the cockpit, fretting when "he shall get there," so as to go ashore to the hotel, does not take kindly to work of any kind, and might freeze stiff in an April cruise, while the active man with a physique and some brains would be in high glee at the prospects, and add years to his life, and multiply energies for the flight of existence. It is time we took our customs from others than the old hens and dawdlers of a past age, who have so long been a hampering weight upon the development of American yachts and yachting. Who cares whether this or that ancient hulk fits out his flounder-bottom schooner or dugout of a steamer or not? Are all hands to be subject to his dictum that the season shall not open before June, and no one but a lunatic should yacht after the first of October? Bounce the lubbers over the side, and let us have a new dispensation better suited to the times. Commission from the time the ice is out of the river until the ice makes again in winter. That is, or ought to be, the season. Your old hen hugs a stove months after the yachtsman should be afloat, and the effeminate drifter shivers and shudders at the notion of a northerly blow a few degrees lower than the zephyrs of broiling midsummer. Nice lot to ordain the models and customs of American yachting.

A LITTLE WONDER.—It takes three dimensions to make space. If any one doubts it, let him visit the shop of Wallin & Gorman, foot of Fifty-sixth street, South Brooklyn, and climb up the side of a bold little cutter they have nearly finished. Though only 20ft. 10in. load-line and but 7ft. 9in. beam extreme, she has more stowage than any flatiron 12 to 15ft. across deck. Reason, 4ft. draft and 3 5 tons displacement. This cutter will make a splendid cruiser and owing to peculiarities in her rig can be sailed by a single hand without trouble. She is intended for coast work. Of course tastes may differ as to her lines and this of that trifle, but taken as a whole, she is a century ahead of the New York light displacement trap. We ought to have a thousand such yachts right here in these waters. For the Sound, the lower Bay, for circumnavigating Long Island and for varying the monotony of smooth-water work with an occasional bold voyage to Block Island and the East by the outside route, for cruising, for fishing, for river or sea, and for permanent life on board throughout the season, in short, for all legitimate yachting purposes such a yacht is pre-eminently adapted. Safe, roomy, handy, buoyant, yet able with a mind of her own in lumpy water, we commend this or similar boats to all in search of sport upon small tonnage in a thoroughly efficient form. We find so much worthy of praise in this little cutter that we will give full illustrations next week.

A STANDARD SPECIMEN.—The handsomest, roomiest, best planned and finest job of the season is the cutter Merlin, now in frame at Lennox's yard, foot of Thirty-fifth street, South Brooklyn. She is being put up by Daniel Bernard and has figured in these columns as "number twelve." Take a look at her before planked if you want to find out what an A1 vessel of her size should be like. Take another when fittings are up and decks laid if you care to know what can be accomplished on limited dimensions. In such craft we revel and delight.

GOOD OUT OF EVIL.—In short, the long, narrow and deep-bodied yachts of the present day are immeasurably more capable sea boats than the shorter and broader yachts of thirty years ago, and it is often a matter of congratulation that the exigencies of the tonnage rule forced yacht builders into producing such an excellent model. Indeed, it is pretty certain that the good qualities of the now fashionable type of yacht would never have been discovered had it not been for yacht racing under the old tonnage rule.—*Dixon Kemp in Shipping World.*

THE LOWELL CUTTER.—The little cutter building by Williams & Stevens, of Lowell, Mass., is similar to the Fendeur illustrated in this paper. It is said that she looks very taking in frame. The topsides are rounded home more, and the lines filled a little in the ends. All who have seen her express surprise at the amount of room inside. The keel drops 4in. below garboards. Floors of iron, timbers 6in. between centers, moulded 7⅛ heel, 1¼ at head, sided 1¼in. Heavy duck sails of No. 6, double bighted. Intended for work about the coast.

NEW SCHOONER.—To avoid misapprehension we may say that the new schooner contemplated by Mr. Wm. F. Weld, to replace the Gitana, will, of course, be a keel vessel. Mr. Weld is well satisfied with the Gitana but desires a larger vessel for an extended cruise around the globe. Mr. Weld writes: "I consider the Gitana a splendid yacht for the North Atlantic and West Indies, but not quite large enough for longer cruises. I prefer a deep draft."

VOLANTE.—This well-known cutter has been sold to Mr. C. K. Cobb, of Boston, through Messrs. Burgess. She is now at Port Jefferson. Volante was designed by Mr. Robert Center as a comfortable cruiser, and has shown fair speed, although that was not the main object of her existence. She has the honor of being one of the earliest representatives of the reform in American yachting, having been launched in 1877.

WASHINGTON Y. C.—The club will open the season early with accessions to the roll. Inquiries have reached us for small cruisers of the Ganet type and several such additions are in prospect. Washington ought to have a fleet of small handy yachts of good depth and displacement for the Potomac and Chesapeake. Charles G. Godfrey has been elected commodore.

AMERICAN Y. C.—The steam yacht club has acquired Charles Island, off Milford, Conn., for club purposes. Area thirty acres. Three-story structure will be erected, with rooms for members and general accommodations. Milford Harbor is two hours by rail from New York, and has excellent facilities for laying up and overhauling of yachts.

THE DEATH OF MR. BARROWS.—We learn with regret the untimely decease of Mr. Barrows, of the firm of Hubbe & Barrows, yacht agents. Mr. Barrows died suddenly Wednesday, Feb. 21, after a short illness of three days. As an upright and earnest worker in his profession he was justly esteemed by all with whom he came in contact.

FIXED BALLAST CAT.—Schmidt & Pannic, Staten Island, have built a catboat for Mr. C. J. Peck, of Chicago. Counterstern, 23ft. deck, 21ft. 6in. water line, 9ft beam and 3ft. deep. Ballast 2,600lbs. lead, cast to fit, and galvanized iron air tanks to float her in case of capsizing. Mast 31ft., boom 25ft., gaff 16ft., hoist 23ft.

LEAD KEEL.—The new cutter building by Smith, at South Boston, for Mr. Weld, of the Hera sloop, has a heavy lead keel, and the frame is steam bent. Such facts denote the rapid progress we are making in construction. Ballast as low as it can be got, stout backbone, and light, but well fastened topsides.

THE NEW RIG.—Mr. George Mathews, Jr., Knickerbocker Y. C., is building a 36-ft. centerboard yacht to be rigged as a cutter, with standing jibstay. Mast 23ft., deck to head: topmast, 23ft.; boom, 31ft.; long gaff of 22ft.; bowsprit outboard, 15ft.; lower sail area, 1,051 sq. ft.

PAINT FOR TARPAULINS.—Gum amber 16oz., melt in boiling linseed oil, half a pint, add genuine asphaltum and rosin, 3oz Mix well over fire, remove to open air, and slowly add one pint of oil of turpentine, slightly warm. Will not crack and gives the canvas a black gloss.

MONTAUK.—This schooner, after weeks of preparation and waiting, finally got away for Bermuda, Thursday morning last. There are some people ready to start after her in a five ton cutter upon ten minutes notice, time to fill up with bread and cheese. But then tastes will differ.

NEW RIGS.—The cutters Kelpie and Rondina will receive rigs from McManus & Son, on the English plan. Drags, or sea anchors, are also being supplied as an article of equipment to many Eastern yachts. These anchors were illustrated in our issue for March 24, 1881.

FINE CUTTER.—The Boston *Herald* says: "Dr Whitney's new cutter at Lawley & Son's yard, South Boston, is in frame. Her lines are graceful, and carry the conviction that the boat will be fast and weatherly."

GLEAM'S DEFEAT.—We have on file some letters detailing the defeat of the Gleam by the little cruiser Aneto in a fresh breeze last fall, out of Larchmont harbor. These letters are open to inspection.

BOUND TO COME TO IT.—The old time Julia is once more being altered into a schooner at City Island. She will have a quarterdeck and no cockpit. Flush deck seems to be the order of the day at last.

HARLEM Y. C.—Has leased Oak Point, on the East River above Port Norris, and will build a club house this spring. Ninety-five members and thirty boats.

ANSWERS.—A number of inquiries remain unanswered for lack of proper address. Our columns are too crowded to reply through the paper.

ILEEN.—This cutter sailed from Savannah, Feb. 20, bound for Havana with a roving commission.

FORTUNA.—This schooner made Port Royal, Jamaica, Feb. 12, with Havana as her next destination.

RANGER.—This schooner arrived off St. Augustine, Fla., Feb. 15.

Canoeing.

FIXTURES.

Winter Camp-fire.—Wednesday, March 12, 8 P. M., No. 23 East Fourteenth street, Kit Kat Club Room. Subject—Tents and Camp Outfits.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with lists of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

HARTFORD C. C.

Editor Forest and Stream:

The Hartford C. C. is yet alive, and it apprised Hartford of that fact most thoroughly last evening by an entertainment which did more for canoeing here than has been done since the club was organized.

The camp scene "brought down the house," and Commodore Jones deserves the credit of making it the picture that it was. After the entertainment our commodore entertained the members in a very pleasant way, and when we broke up, the vote was that the venture had been a grand success.

It is our wish to attend the A. C. A. meet this year in force, and although not a cruising club but a club of cruisers, we hope to make many friends, and have the grand time we are promised by our friends of the S. C. C. H. C. C.

HARTFORD, Conn., Feb. 19, 1884.

SPRINGFIELD C. C.

Editor Forest and Stream:

The annual meeting of the Springfield C. C. was held Thursday evening, Feb. 14, and the following officers were elected: Frank D. Foot, Commodore; M. B. L. Bradford, Vice-Commodore; C. M. Shedd, Secretary and Treasurer. Executive Committe, F. D. Foot, Geo. C. Barney, W. F. Callender. We also elected four new members to the club. They are Mr. A. L. Spooner, Mr. Harry Chapin, Mr. A. L. Fennessey and Mr. Geo. Leonard, making twenty-six active members. The treasurer was instructed to buy two open canoes to be known as club canoes. The ice has gone out of our river, and last Friday when the ice was gone on the east side of the river, Commodore Nickerson paddled and sailed a mile or so and was very much surprised to see an iceboat coming down the river on the west side. We look for an early season here and know we shall have a lively canoeing summer.

C. M. SHEDD, Secretary S.C.C.

The canoe men have quietly, as is their way, put on foot a scheme for enlarging the membership and usefulness of their organization. They voted at their recent annual meeting to have the constitution of the club changed so as to admit associate members, and to buy at least two canoes for the common use of such members. Canoeing has been steadily growing in favor in the city, and the club have taken this action in recognition of the fact that several men, though not sufficiently fascinated by the sport to invest in a canoe for their sole use, are willing to pay $10 or $15 a year for the privilege of paddling in a "club canoe." The club has now twenty-six active members, all of them canoe owners, and is a happy and united organization, and does not by any means propose, even if associate members are taken in, to intrust its welfare to any but genuine canoemen, as the "associates" are not to be allowed a voice or vote in the business meetings. The club is well fixed financially, and has a model canoe house on a river having all the charms that a canoeist can ask for or find in this country. The canoe, like womankind, has many friends and admirers who cannot see their way to personal proprietorship, and the club will do well to adopt and educate them. This matter will be decided finally at a meeting of the club shortly to be held.—*Exchange.*

CANOE VERSUS SNEAKBOX.

Editor Forest and Stream:

I must take exceptions to "Seneca's" opinion as to the seaworthiness of the canoe, when he says the sneakbox "will live in a gale of wind that the heaviest ballasted Pearl would not dare to face." I have been informed by pretty reliable authority that during the month of August, the Thousand Islands region, about Clayton particularly, is frequently visited by very heavy northwesterly gales that kick up a raging boiling sea. Now, if "Seneca" will bring his sneakbox to that region in August next, I will meet him there, and when one of these gales is on the rampage I will sail him a race of five miles to windward and return, and will not use "a heavily ballasted Pearl either." CHAS. A. NEIDÉ.

THE GALLEY FIRE.

A FEW HINTS ON CAMPING.

CANOE BEDS AND LAMPS.

WHEN the skipper of the Boreas goes below at his usual hour for turning in, he finds the berth in his stateroom made up with an air bed, or rather cushion, and a pillow of the same nature; on these he sleeps the sleep of the good and tired canoeist.

After two weeks' use at Stony Lake, he considers such a bed simply perfection. Hair cushions are good and soft, but when compared with the ease of air beds, are hard and unyielding. The skipper is still on the sunny side of forty, but years of sleeping on hair mattresses and springs, have incapacitated him for reclining on the soft side of planks or a few thicknesses of blankets. He requires something to fit his rather sharp bones, and the air bed just fills the bill.

The cushion is 24in. wide by 46in in length, the pillow is about 10×15. To make up the berth at night, the cushioned seat on which the captain sits while sailing or paddling is put across the Boreas just touching the aft end of centerboard box. On this is placed the pillow about half inflated. The cushion is now inflated to about the same extent and put close up against the pillow with the nozzle at top. When lying full length the valve can be unscrewed and air allowed to escape until everything is comfortable. It is best when half full. It then adjusts itself to every motion of the body. Nothing easier and more restful can be imagined.

In the morning the cushion is collapsed into a very small bundle, and the pillow is used as a life preserver during the day. The cost cannot be given, as it was a present from a friend who had it made to order in England. Less than a minute will inflate it for use. The skipper intends having a cover of drill made and put on to protect it from wear and tear as much as possible.

I can thoroughly indorse Mr. Willoughby's remarks as to the *flamme forcé* spirit lamp I have tried a number of different styles, including a regular Rob Roy cuisine, but prefer the above. I have used it for three seasons and like it better every time. Mine is a genuine French one.

Mr. Whitlock has one like mine, and at Stony Lake the Knickerbockers had several of a larger size made in New York. Two firms in Toronto now have them for sale.

Mr. Tyson brought out with him from England a smaller size of the *flamme forcé*, and another style which has two ordinary wicks. It gives a great deal of heat but uses up spirit rapidly. The *flamme forcé* is very economical in this respect.

If one wishes to do much cooking, two lamps will be found convenient. I expect to receive from England shortly a lamp which is, I think, on the principle of the *forcé*, but the flame is adjustable. This should be a great improvement, as one often wishes to keep a dish warm without allowing it to boil. When received and tested I shall give you the results. The name is, I believe, the "Cyprus."

In my first canoe cruise, I cooked, or rather warmed water, with an arrangement called a lamp kettle, devised by a Torontonian. The fuel was kerosene. It was useless for anything but heating water, and wasn't very good at that. The advantages of cooking with spirit are many. The dishes used are always clean, and you can cook afloat.

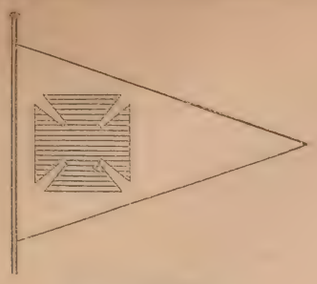
Granite dishes are best. The extra weight is more than compensated for by ease of cleaning. BOREAS.

SMOKE 'EM OUT.

MANY canoeists will next summer be troubled by mosquitoes and other insect pests. I have never yet seen in print the only certain preventive of their unwelcome attentions. While in camp on the Toledi River in New Brunswick last summer, our lives at night were made miserable by them.

Nothing but "slitheroo," as the author of "Birch and Paddle," etc., called it, afforded any protection. (Slitheroo is a savory concoction of tar, sweet oil, pennyroyal, etc., which when smeared over face, neck, hands etc., makes one look as if he had tumbled head first into a molasses barrel. It has sundry other names, but the constituent and effect are generally the same).

Finally Pete Solace, my Indian guide, said: "You think you like a smudge?"



"Think I should," said I, "if it will kill these pests." Pete said no more, but took up his axe and strode off into the brush. I followed him. He finally came upon a fallen cedar, dry, but not rotten.

From the under side of the log, at a place where it lay clear of the ground, he cut strips of bark about six feet long, enough to make a bundle a little larger than I could span with my two hands. A little further on he struck his axe into the base of a young green cedar, cut the bark, raised it with the axe blade, and with a strong pull upward stripped it up to the first limb or more. He then took the white inner bark, and peeling it into long pliable strips, bound the dry bark at intervals of about nine inches into a compact mass.

One end of this ignited in the camp-fire, the whole would burn slowly like a cigar, sending forth a light blue smoke, fragrant and slightly acrid, though not disagreeably so to the eyes. Passed about in the tent for a few minutes all every winged tormentor would vanish; and then laid upon the ground in front, the smoke would drift upward into and about our sleeping place, and we had peace.

A smudge six feet long would smoulder all night. I have often turned out in the morning and found the long trail of ashes on the ground, the remains of the best insect protector ever invented. The smoke did not trouble our eyes, and to the nostrils the fragrant cedar was far from disagreeable. It also made an excellent protector in the canoe at night, when the trout were leaping to our feathered lures, although a pipe full of good Virginia protected me.

I suppose dry hemlock or spruce bark can be used in the same way, although I do not know this to be a fact, and should be glad to learn, for in all parts of the country cedar is not available. SIG.

AMSTERDAM C. C.

SIGNAL, blue maltese cross on white ground. Amsterdam, N. Y. Established 1883.

AMATEUR CANOE BUILDING.

Eighth Paper.

BUILDING.

THE drawing of the boat being completed, the moulds made from it and the bench and stocks being ready as previously described, the first step in the actual work of building, is the shaping of the keel. If the boat has no centerboard trunk, the keel is made of the same siding or thickness as the stem and stern, for its entire length, its depth below the rabbet being taken from the drawing and ¼in., the thickness of the plank, added. The keel may be made 1¼in. deep, the extra depth, if more is required, being made up by a false keel screwed to it, which may be removed for shoal water, as shown in Fig. 11. In selecting

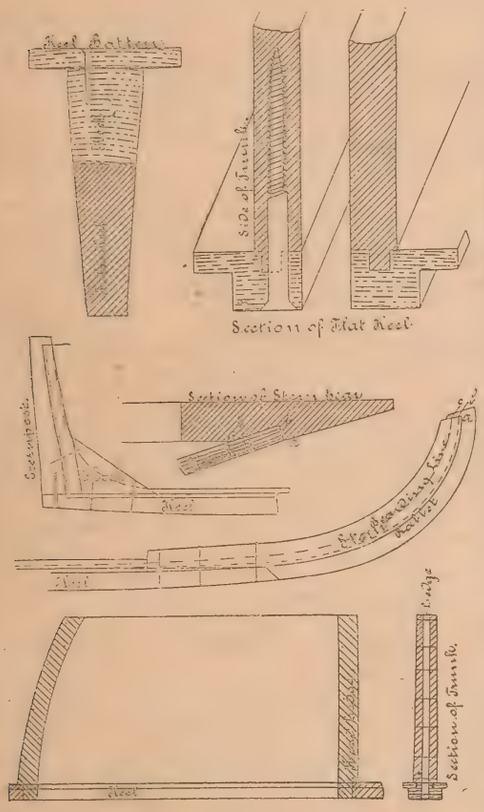


FIG. 11.

the wood for the keel and keel batten, the layers should lie horizontally, as shown.

If for a centerboard, either of the usual form, or one of the patented varieties requiring a trunk, a flat keel must be used as shown in the plate, which represents the cross section of a flat keel and centerboard trunk. The width, for the length of the trunk, will be 3½in. on top, tapering to the size of the stem and stern at its ends, the depth or thickness of the keel being uniform, ⅝in. to 1in. throughout its length.

With the edge keel, a keel batten is necessary as shown in the cross section. This will be ¼in. thick, and 1in. wider than the keel, to which it is nailed, thus overlapping the latter ¼in. on each side, forming a rabbet for the garboards. If the flat keel is used, the rabbet is cut directly on the keel.

The stem is next sawed out from a hackmatack knee, and planed up ⅝ or 1in. thick, for an ordinary canoe, and the fore edge, rabbet and bearding lines marked on it, using the moulds made for each.

The rabbet line of a boat, marked *a* in the drawing, is the line where the outer surface of the skin or planking joins the surface of the stem, stern, and keel; the inner or back rabbet, *b*, shown by the dotted line, is the line along which the inner side of the plank joins the lower edge or ends of the same, and the bearding line, *c*, shown by a broken line, is where the inner surface of the skin joins the deadwoods, keel, stem and stern. The back rabbet is found by squaring in from the rabbet line, a distance equal to the thickness of the plank.

After the rabbet and bearding lines are laid off, the rabbet is cut, a piece of wood ¼in. thick and several inches long being used, applied to the rabbet as the cutting progresses to test its depth and shape. The rabbet is not cut quite to its full depth at present.

The sternpost in most canoes is made of a knee, the rabbet being curved as at the bow (see drawing of the Dot in the FOREST AND STREAM for May 24, 1883), but there is no good reason for so doing, unless the rake of the sternpost is excessive, as is now seldom the case, and a better plan is to make the sternpost of a straight piece, as shown, the rabbet forming a right angle or a little more, at the junction of keel and post. This piece is planed up, the rabbet marked and cut, as in the stem, and fastened to the keel by a 2½in. screw passing up into it, as shown, and further secured by a chock of oak nailed or screwed in the angle.

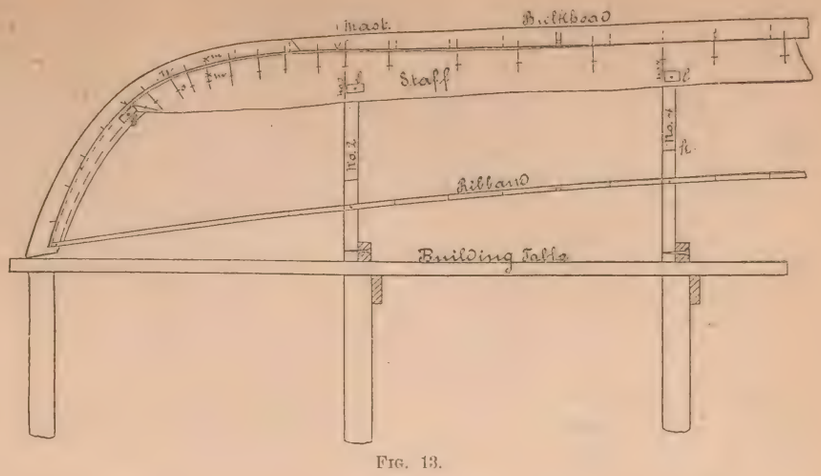

FIG. 13.

To fasten stem and keel together, a scarf is cut of the shape shown in the drawing, about 8in. long, copper nails being driven through the keel and stem, and rivetted over burrs on the top of the former. The keel batten is now nailed on top of keel, butting against the stem forward and the chock aft. The bearding line is drawn in where it has been omitted across the scarf forward and chock aft, and the rabbet trimmed at these points and the frame laid on the large drawing, from which the water line is marked on stem and stern, and the positions of moulds, bulkheads, mast steps, trunk, etc., on both top and bottom of keel.

If a centerboard trunk is required, it must be put in now; being constructed as shown by the sectional views. The head ledges, forming the ends of the trunk, are of oak, 1½in. wide and as thick as the slot or opening, ⅝in. for a thin iron board, and ⅞ to 1in. for a heavy iron or a wooden one. The slot is first cut, 1½in. longer at each end than the required opening, then a groove, ¼in. wide and deep, is ploughed on each side of it for its entire length.

The head ledges are now fitted in place, projecting over the keel ¼in. fore and aft, to allow for caulking, and fastened by a copper rivet through the keel and lower end of each to keep the keel from splitting. The sides of the case, of dry pine, are ⅛in. thick on the lower edges, each of which has a tongue on it to fit the grooves in keel, and ¼in. on upper edges. A thread of cotton lamp wick is laid in the grooves, the inner surface of the sides, as well as their lower edges, the keel and the head ledges are well painted, and they are put in place and driven into the grooves. Before the paint is hard the sides are rivetted to the head ledges with ½in. copper nails, and brass screws 3¼in long, spaced 6in. apart, are put through the keel up into the sides, the holes for them being very carefully bored and countersunk into the keel. If the board is hung on a bolt, the hole for it must now be bored, as it cannot be done later.

The moulds must now be fitted to their places, a small piece being cut out of each to admit that part of the keel and keelson inside of the bearding line, after which, if the boat is to be built with the keel down, the frame is placed in position on the stocks, secured by a few nails driven through the keel into the latter (which will be drawn and the holes plugged when the boat is ready to turn over), the stem and stern are plumbed with a plumb-line and fastened by shores from the floor or roof, the moulds put in position, adjusted by a centerline from stem to stern, and also shored firmly.

If the latter method of building is followed, the moulds are screwed to the table, the frame laid on them, and all firmly shored from floor to ceiling. Now a ribband one-half inch square is nailed along on each side, at the height of the deck, being fastened to the stem, stern and the moulds, and the positions of the bulkheads and ribs are squared up or down on to them.

To prevent any leakage through the scarfs, stopwaters are next put in. These are small plugs of dry pine, the holes for which are bored where the seam or joint crosses the rabbet. They should be bored between the inner and outer rabbet lines, Fig. 12, so as to be covered by the caulking, if in a

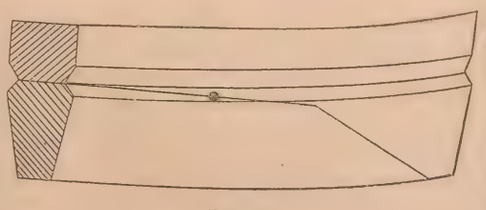

FIG. 12.

large boat, or by the edge of the plank where the seam is not caulked, as in a canoe. This should be done at all scarfs, or where water is liable to follow a seam.

The rabbet is now completed by trimming it out with a sharp chisel, using as a guide, a strip 1x¼in., and long enough to cross at least two moulds. This is held down across the moulds, one end being applied to the rabbet, and the wood cut away until the surface of the strip and the outside of stem and stern coincide.

The positions of the ribs are now laid off, as shown in Fig. 13, which represents the fore end of a canoe, set up on a building table or bench. The distance apart of the ribs will be 5in., with an intermediate rivet through each lap between every pair of timbers. Beginning at station 7 the spaces of 5in. are laid off toward bow and stern to within a foot of each end, and marked on top and bottom of keel so as to be seen from inside or outside when the plank is on, and also squared down on the ribband.

Perhaps the most difficult part of boat building, certainly the most difficult to make plain to a novice, is the planking. In order to obtain both strength and durability, each piece must be put on in such a way that it will bring no strain on any one part, and will not itself be forced into an unnatural shape, to attain which ends, though it may be bent or twisted, it must not be "sprung" edgeways or in the direction of its breadth, or it can never be made to fit properly. Although strakes are sometimes "sprung on" by experienced builders, the amateur should not attempt it, as the chances are that the framework will be pulled out of shape.

Before commencing to plank, the beginner can obtain an idea of how the planks must lie by taking a piece of board as long as the boat, 4 or 5in. wide and ¼in. thick, tacking the middle on moulds 6 and 8 at about the turn of the bilge, and then bending the plank until it lies on all the other moulds, but not forcing it edgeways to or from the keel. The ends of course will come up higher on bow and stern than the middle, and if the piece be laid in a similar manner along the keel they will also be higher. The garboard streak, or that next the keel, will be 4 to 5in. wide in most canoes; then marking off the width desired, 4½in., for instance, on moulds 6 and 8, the board mentioned above, having one straight edge, is laid over the moulds, its straight edge 4½in. from the keel and the ends bent down and tacked to each mould and the stem and stern, and a mark is made where the board crosses, showing the position of the upper edge of the garboard. By upper edge is meant the edge nearest the gunwale, in all cases, whether the boat is built keel up or otherwise. With some models it will be better to vary somewhat from this line, of which the builder must judge for himself, according to the circumstances of the case.

Next, to lay off the upper streak, we will take a width of 3¼in. at amidships, 2in. at bow and 1¾in. at stern, marking off these distances (Fig. 13) from the upper edge of the streak, already marked by a ribband, and putting a similar ribband through these three points, bending it fair and marking where it crosses each mould. There should be six streaks on each side, so there remain still four to be laid off; to do which, the distance from the lower edge of the upper streak to the upper edge of the garboard on bow, stern and each mould is divided into four equal parts, making the planks all the same width on any given mould, though of course the widths on one mould differ from those on another, as the planks taper toward the ends, the girths at bow and stern being much less than amidships.

The planks being laid off, the next operation is to get the shape of the garboard, to do which a "staff" is necessary. This is a piece of board four or five inches wide, one-quarter inch thick, and as long as the boat, several having more or less curvature, being necessary for the different strakes. For accurate work, especially where there is no help at hand, it is best to have two short pieces, each about one foot longer than half the boat's length. One of these pieces is cut roughly to the shape of the forward rabbet and fastened in place with a screw clamp, or a small piece of wood with a nail through it called a hutchock (*e*) Fig. 13. It is then bent carefully over the moulds as far as it will reach, and fastened to each with a hutchock. The staff should be of uniform thickness and quality so as to bend fairly, and is best cut so as to lie in the rabbet, though it need not fit closely. A similar piece is now fitted aft, lapping some two feet over the former, and the two are nailed firmly together, so as to preserve their relative positions when removed from the moulds. As the fitting of the garboard depends mainly on the manner in which the spiling is taken, great care is needed to prevent the staff springing or buckling in applying it.

When it is properly adjusted a series of marks are made with the rule and pencil on the rabbet line on the frame, and also across the staff, about two inches apart where the line is curved, as at the stem, and four inches where it is straighter along the keel. These marks are to insure the compasses being set at the same points in taking the spiling, and in transferring from the staff to the plank afterward, as will be understood later.

Now, with the compasses set to any convenient distance, usually from two to three inches, a circle is first swept on the staff, to reset them by if accidentally changed; then one point is applied to a mark on the rabbet line, as at *n*, and, with the other, a prick mark is made on the same line, at *o* on the staff. The compasses are applied in succession to each of the other points on the rabbet line and marks made on the staff, one line on the stem marked X (*m m*) being called a sirmark, by which the plank is finally adjusted.

THE WINTER CAMP-FIRE.

NO meeting was held on Feb. 19, owing to a misunderstanding in regard to the date, so the subject will be deferred until the next meeting.

THE CHART LOCKER.

V.—INLAND WATERS OF MAINE.

Editor Forest and Stream:

Your correspondent "X.," under "The Chart Locker" head, will get a general idea of the trip between Moosehead and Megantic lakes by reference to my account of the trip, contained in FOREST AND STREAM of Nov. 15 last. I made the trip in a Stranahan canvas boat.

Attean and Spencer rips and Holeb Falls would have to be passed by short portages. As the four miles between Long Pond and Little Brassua Lake is almost a continuation of rapids, with two or three bad pitches, I should prefer to carry the distance by an excellent tote road, which follows the northerly bank of the Moose River. As this road, however, is generally near the river, it could be taken at any point if thought advisable. From this place to the head of canoe navigation there is not much swift water, except at the rips and falls mentioned.

In July a connection could be made with the construction train on the International Railway, at a point on the Moose River about twenty-five miles from Megantic Lake, where I launched my canoe last September. The railway is now built to within seven or eight miles of this point, which is a little below Lowell Falls. I presume that by carrying by these falls a canoe would have no difficulty in getting to Gordon's railway camp. In July there would be excellent trout fishing anywhere along the river.

The Chaudiere River is the outlet of Megantic Lake, and is crossed at the outlet by the International Railway. This is the present terminus of the railway, the other end being at Sherbrooke, sixty-nine miles distant. The Chaudiere can be run to Quebec by exercising a little caution. The upper river is a succession of short stretches of sluggish water with short rapids or chutes between. As the river is full of granite boulders, one should let a canoe down these with a pole, or use a line from the bank.

By running bow on in attempting to make the trip to Quebec a few years ago I came to grief, and had to find my way through the woods to the head of Lake St. Francis. After getting some fifty or sixty miles down the river the country is settled all the way to Quebec. The Quebec Central Railway from Sherbrooke to Quebec crosses the river at St. Joseph, Beauce, and the Grand Trunk Railway from Montreal to Quebec at the Chaudiere Falls, near Quebec.

As there are some bad places in both the Moose and Chaudiere rivers, I should want a companion on such a trip. After leaving Moose Beach supplies can be had at Moose River Village, Pat McKenney's, at the head of Wood Pond, Gordon's Camp and Megantic.

D. THOMAS.

RUSHTON'S CANOES.—We were looking back over some old numbers of the FOREST AND STREAM the other day, and we found that Mr. J. H. Rushton's canoe advertisement has been in this journal for nine years, every issue. The growth of the Canton business has been commensurate with the progress of canoeing in this country. Mr. Rushton, we believe, got into the business by chance. He wanted a canoe for himself, and built it. Then some one of his friends wanted a canoe like it, and Rushton built it for him. By and by the demand for Rushton canoes was so great that it took all his time, and he "set up shop." Now his annual business runs up into the tens of thousands of dollars somewhere. The three points of his success, as we understand them, are: First—Charge a price for goods that will allow of first-class work. Second—Put only good material into the goods and do not scrimp on the work. Third—Advertise in FOREST AND STREAM. We expect to adorn the second page of the cover with Mr. Rushton's advertisement for nine years longer.

WE RECEIVE JUST SUCH LETTERS EVERY WEEK.—Boston, Feb. 8.—*Editor Forest and Stream:* My advertisement in your paper, expiring 14th inst., was put in with the intention of renewing, but I have received so many orders from all parts of the country—from west of the Mississippi to the Gulf of St. Lawrence—that I must make my deliveries before I advertise any further. I can recommend your paper to any one who has good dogs for sale. To be sure, I have wasted some postage stamps in replying to inquiries, but the majority of inquiries have been from parties who mean business and who are prominent men. No doubt you have many such letters as this, but if it is of any service, use it, for you deserve it.—J. A. NICKERSON.

THE St. Gothard tunnel, under the Alps, is 9¼ miles in length. The same distance could be measured by 334,900 of Esterbrook's Commercial Pens extended lengthways.—*Adv.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, and POULTRY.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stable and Turfmen, Horse Railroads, Manufacturers, Coal Mine Companies, Trav'g Hippodromes and Menageries, and others handling stock, with perfect success.

Humphreys' Veterinary Manual, (399 pp.) sent free by mail on receipt of price, 50 cents.

☞ Pamphlets sent free on application.

HUMPHREYS HOMEOPATHIC MED. CO. 109 Fulton Street, New York.

NERVOUS DEBILITY

HUMPHREYS' HOMEOPATHIC SPECIFIC No. 28.

Vital Weakness and Prostration from over-work or indiscretion, is radically and promptly cured by it. Been in use 20 years, —is the most successful remedy known. Price $1 per vial, or 5 vials and large vial of powder for $5, sent post-free on receipt of price. Humphreys' Homeo. Med. Co. Illust. Catalogue free.] 109 Fulton St., N. Y.

ARTIFICIAL FLIES.

TRADE MARK

We keep constantly in stock over 500 varieties of

Trout, Black Bass, Grayling & Salmon Flies.

Particular attention given to the selection of the gut, and all flies tied on our HIGHEST QUALITY SPROAT HOOKS.

Sizes of Trout Flies from No. 2 to No. 18. Any pattern tied to order.

If your dealer does not keep our goods in stock, or will not order them for you, send us 50 cents for our 120-page illustrated catalogue.

ABBEY & IMBRIE,

Manufacturers of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, NEW YORK.

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

WARNING!

Buy or use no Clay Pigeons or Clay Pigeon Traps excepting those made or licensed by

The Ligowsky Clay Pigeon Co., Cincinnati, O.

This company owns the original patents on "Clay Pigeons" and "Clay Pigeon" Traps. Others are manufacturing in infringement of these patents; and all who use or sell such infringing Clay Pigeons or Clay Pigeon Traps will be prosecuted. The Ligowsky Clay Pigeon Co. furnishes traps at $7.00, with all the latest improvements and guaranteed against any liability for infringement.

Send for circulars of the 5-days programme of the First International Clay Pigeon Tournament, Chicago, May 26 to 31. Over $5,000 in prizes and sweepstakes.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, MARCH 6, 1884.

VOL. XXII.—No. 6. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canadas. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

LAWYERS' FEES VERSUS CHAMPAGNE.

IT IS an old story, repeated year after year. A game protective society is established; and enters with wonderful vim and zeal upon the momentous work of protecting the game. After a little while it gets tired and fizzles out. The active work is left for two or three of the most enthusiastic members. The rest do the talking. And they do a great deal of it. Talk is cheap. We know men who will talk game protection by the hour, day or week. Then they go into the field or the woods and kill all they can. We could name individuals who talk game protection so earnestly at home that they have completely exhausted their feeling on the subject by the time they get a chance at big game out of season.

Game protection talk involves semi-occasional meetings of the society. These in turn call for a copious flow of champagne of approved brands. The champagne is usually accompanied by a flood of genuine eloquence. Denunciations of the work of market shooters and "trout hogs" are followed by suggestions of what some one else, other than the speaker, ought to do about it. Indignation and enthusiasm glow in the breasts of the orators and suffuse their countenances. The fire rages so furiously that by the next morning it will be found to have burned itself out, and the game protector's ardor will then be as cold as the ashes of the cigars he smoked at the meeting.

It is a truth, susceptible of demonstration, that money devoted to paying lawyers' fees for the prosecution of game law breakers will accomplish more for game protection than the same money expended for champagne dinners. A bill of fare is an excellent thing in its way, but there are occasions when a lawyer's brief would be more to the point; post-prandial heated oratory rounds off the dinner, but the cold, convincing logic of a lawyer before a jury of twelve men will do more to discourage the sale of snared game.

SHOTGUN PHILANTHROPY.

IN a flourishing city of Western New York dwells a physician who, by means of a judicious use of printer's ink, is well known beyond the bounds of the Empire State. In addition to the arduous toils of a dispenser (on a wholesale scale) of patent medicines and an author (also on a wholsale scale) of medical works, this gentleman has devoted lavish sums of money to secure the protection of game and to encourage the art of wing-shooting. His ardor as a game protector led him some years ago to present to the New York State Association for the Protection of Fish and Game, of which he was at the time president, an $850 diamond badge, as a prize for the game protector who would under given conditions kill the most pigeons. That plan having doubtless secured the desired result, and game in consequence being abundant, the benevolent physician has set now out to provide the populace with weapons to slay it. He appears in the guise of a cheap shotgun philanthropist. Here is the proposition (though we are obliged to omit the beautiful delineation of the renowned Zulu gun which embellishes the original). It reads:

A GOOD BREECH-LOADING SHOT GUN FOR $4.00,
AND THE MEDICAL ADVISER THROWN IN AS A PRESENT.
Price $8.50 without the Present.

A STRONG, DURABLE AND CLOSE SHOOTER.
12 Gauge, Uses either Metal or Paper Shells.

Having made special arrangements with the manufacturers, we are enabled to sell these guns at the remarkable low figure of $4.00 and give a copy of the Medical Adviser to each purchaser as a present. The gun will be packed and delivered at the express office in Buffalo without charge. We will also furnish, if ordered with gun, 100 good paper shells for 80 cents; and a set of re-loading implements, consisting of rammer with cap-expelling pin and tool for recapping shells, for 50 cents. We guarantee the gun to be a strong and close shooting one. We will send the gun as a premium for a club order for 10 copies of the Medical Adviser, with the money, $15.00, giving also to each member of club a present of any $1.00 article in this circular. Send in your club order.

Thus it may be seen that in the person of this energetic game protector and enthusiastic promoter of wing-shooting has arisen a dealer in cheap guns who has a conscience as well as a possible eye to the main chance. For the paltry sum of four dollars he will outfit you with a "good breech-loading shotgun," and, man of kindly forethought that he is, a "Medical Adviser" to go with it. What a "filling of a long-felt want" it is when one takes the field with such a weapon to have at one's elbow a Medical Adviser with a supply of lint, bandages, and a full and suggestive kit of surgical tools ready for any accident, and who, if you should happen to go off with your gun, might carry to your friends an exact and scientific report of the cause and manner of your taking off. But better than all these, if he were a proper Medical Adviser, when he saw the game start before you and you raising your four-dollar shotgun for the almost inevitable deadly shot, he would stop you with the brief advice, or command perhaps, "Don't shoot!"

But let us read the advertisement over again. Ah, the Medical Adviser is only a book, after all. That is not so well, for though one might carry the volume under his arm, or in his pocket if of convenient size, to get it out and hunt up the chapter on gun-shot wounds after one had a finger or a hand blown off, would be awkward and apt to consume valuable time; and then the appliances to be used in such cases might not be at hand, and one might not be able to treat himself by book, especially if he had lost his head, as sometimes happens to those who shoot four-dollar breech-loading shotguns, and even muzzleloading ones of that extravagant price.

And so, upon the whole, while we duly appreciate the benevolence of this advertiser, we cannot advise our readers to buy his gun, even with the "Medical Adviser thrown in;" in fact we should feel easier in our mind to recommend as a safe investment the buying of the Medical Adviser itself, with the four-dollar breechloading shotgun thrown out.

THE BIRDS, the song birds, the bright-plumaged birds, the birds that chirp about the doorway, the birds that sing in the orchard, and twitter under the eaves of the old barn, the birds that circle in the meadow, the birds that cheer one's spirit by their vivacity and melody—these are the birds that the New England farmers are now devising measures to protect. The cause is a most excellent one, and the farmers are more interested in it than any one else.

THE BOSTON GAME MARKET.

THE matter of a uniform code of game laws in New England, so far as Massachusetts is concerned, is now in the hands of the Committee on Agriculture. Its many friends believe that the committee will report a bill to the Legislature indorsing the measure in the main, though the game dealers have "dined and wined" the members of the committee. The hearing before the committee was exhaustive, occupying two days, and drew out facts showing that the Boston market is even a worse institution for the harboring of game out of season in other States than it has the name of being. Game dealers, who know whereof they speak, testified that the business—all in the hands of twenty or thirty men—amounts to from $200,000 to $300,000 annually. It also appeared that there are now actually in Boston, in cold storage, at least 100,000 quail.

It was proved before the committee that freshly killed quail had been repeatedly seen in the market since Jan. 1, the legal close time for killing in this and many other States. It was also shown that the marketman, being allowed to sell pinnated grouse, takes advantage and sells ruffed grouse illegally. In consequence of this laxity of law in permitting the selling of game out of season, it is next to impossible to prevent the sale of illegally killed birds. It was clearly shown that the game of the West was fast being depleted by the enormous demand for it in Europe, and Boston is the center for its shipment. American deer, grouse and quail are cheaper in Liverpool to-day than in Boston or New York. The refrigerator business of Boston has dug the grave of the game of the northwestern country, unless Massachusetts puts a stop to it.

The chances that the uniform game bill will pass, if reported by the committee, are not doubted by its friends. The enemies, the marketmen, have been out in full force, but they could show at the hearing only that an extensive business would be stopped. They laid claims to class legislation being proposed, and would have other States look out for their own game without help from Massachusetts. But the narrowness and selfishness of their ideas was so apparent as to plainly show that class legislation was long ago granted to them when the law was made allowing them to have in possession and sell game when sportsmen and other people would be arrested for it.

THE PENNSYLVANIA CASE reported in our last issue (page 88) is worthy of notice. The Lycoming Sportsmen's Club sought to secure the indictment of certain men who had drawn a seine in a millpond (public water). The judge, in charging the Grand Jury, is reported to have asserted that the seiners had the same right to take fish from the pond that a farmer would have to take his cattle from the pasture. If the circumstances were as our informant has given them in the communication referred to, this ruling of the judge was clearly wrong. We do not wonder that the members of the club were discouraged by the adverse influence of the judge. There can be no question, we venture to opine, that the society was perfectly right in its position. If the principle stated by the judge in his charge to the jury holds good with regard to the Williamsport millpond, where shall the limit between public and private waters be drawn, and how may the fish in any of the waters of Pennsylvania be protected from improvident netting? When a game protective society undertakes a case of this kind, the least it can ask is a proper and fair administration of the law. When men who ply their unlawful fishing find judges and juries ready and willing to acquit them, in the face of the clearest laws, it is indeed time for societies to organize for the protection of the public. We hope that, for the good of Pennsylvania fishing interests, the Lycoming Sportsmen's Club will not let the case drop here.

A SPORTS DEFENSE ASSOCIATION.—Englishmen are organizing a Sports Defense Association to combat the efforts of those who are attempting to secure a law to forbid pigeon shooting. It is urged that the abolition of trap-shooting will mean the ultimate suppression of all pursuit of game and fish, and the pigeon shooters are calling on the anglers and the fox hunters to join their rally. The bill to suppress pigeon shooting, it is probable, will be urged again this year.

"WOODCRAFT."—A book on "Woodcraft" has been written by "Nessmuk." It is designed to give practical help to amateurs. It will do more than this, it will open the eyes of the veterans. "Woodcraft" will differ from the average book on camping, for as we have said it is written by "Nessmuk." The Forest and Stream Publishing Company will publish the book in April.

The Sportsman Tourist.

BETWEEN THE LAKES.

Sixth Paper.

WHERE TO GO A-FISHING.

THE summer wanderer who finds himself in the Upper Peninsula, will hardly be willing to return to his home without first visiting the city of Marquette, the chief city of the region, between the lakes. Most persons will, doubtless, go a hundred miles by rail or steamer further up and take a look at the great copper mining interests on the Kewena Peninsula, and mayhap some will take a run along the coast up toward the Ontonagon Lighthouse and Union Bay, where there is, I am assured, little difficulty in striking first-class trout streams that have seldom or never been fished. I do not speak by the card, however, having never been there myself; but ere another summer's sun runs its annual course I hope to see and know something of that region, for I have faith in what I have heard of it.

If the visitor does not go up to the copper region, he will be quite sure to take a run out to the iron mines, an hour's ride from Marquette—mines that, in some respects, have not their equal in the world.

At any rate, he will go to Marquette. This is a city of nearly five thousand inhabitants, beautifully situated on the igneous rocks that crop out along the head of the Marquette Bay. The town is fast coming into notice as a summer resort. During the hot months it is so delightfully cool, and the lake views are so charming, and the fishing in the vicinity has been and is so good, that those who try the dog-days there once are sure to try them again. Marquette is the western terminus of the Detroit, Mackinac & Marquette Railroad and the eastern of the Marquette, Negaunee & Houghton which taps the Northwestern leading to Chicago. Besides its railroad connections, lake steamers stop at its wharves at stated intervals, and so it is plain to be seen that Marquette is a town easy to go to and easy to get away from.

I did not go a-fishing while stopping in Marquette. I spent my time looking at the houses of the iron aristocracy, some of which are rather tawdry-looking; I went through the sawmill where lumber retails for about the same it does after being shipped by water and rail five hundred miles southward. I saw long trains of hopper-built ore cars thundering out upon the stilted piers where they dumped their loads into barges and vessels anchored to receive them. I enjoyed the lake breezes and the clear, cool-looking waters; I mentally inventoried the contents in the show windows—the specimens of iron and copper ores, the toy bark canoes, and other supposed evidences of Indian handicraft—and I looked at the people as they tramped cheerfully and busily up and down their principal street—and so I did not go a-fishing.

Fifteen to thirty miles up the lake shore, I am told, there is good fishing to be had in the Garlic, Yellow Dog and Salmon Trout and other streams. Sportsmen row or sail up the shore, and not only visit the streams, but fish off the rocks, and capital times they occasionally have.

But one need not go so far. Two miles south of town the Carp River enters the lake, and at favorable seasons the trout fisherman who knows the pools, the sunken logs and shelving rocks wherein and underneath which the trout love to lurk, may take them in such size and numbers as in some reputed trout regions of our country would claim the admiration of all who saw them.

But a member of the FOREST AND STREAM family will hardly stop at the Carp. He will go further, and if he will follow me I will lead him to some places along the line of the D., M. & M. Railroad, where he will not fare worse.

Going from Marquette the railroad track curves around the bay, and for thirty miles occasional views of bay and lake may be had, so near to the shore does the road run. The first trout stream after passing the Carp is the Chocolate, four miles from Marquette. Here is a station, but we will not stop. It is curious to note, however, that the Chocolate runs parallel with the lake shore for a distance of four miles, and the engineers took advantage of the sand ridge piled up between and laid their track upon it, and at no point within the four miles is the road over half a mile from the creek, or river, as all creeks discharging their waters into the lake are here called.

Eleven miles further on and we come to Sand River, which we cross within a few rods of the lake shore. Here is a station and here trout may be taken, but it would hardly be wise in us to stop for them, and so we go on four miles further to Whitefish Station on the Sable River, as it is named on the map. As Sable means sand, and we have so recently crossed a Sand River, we conclude that we must be in a sandy region, and so we are. Thus far we have been running over ridges of sand that have been piled up in some distant bygone age when the Lake Superior level stood at an altitude of from forty to sixty feet higher than it does now. But we will pass the Sable River by, although trout may be caught in its waters.

Two miles further, which is twenty-one miles from Marquette, brings us to Onota, and a mile therefrom is Deer Lake. Now, I never fished in that lake, but a Mr. Wardle, an Ohio man, and an intelligent Ohio man at that, and one who has evidently done a good deal of fishing during his time, visited us at our camp at Jeromeville and he told us of two visits he had made to Deer Lake. On the first he and his brother sportsman met with marvelous success. Notwithstanding the boat they found on the lake was leaky and unwieldy, they caught with a spoon more bass than they could conveniently handle, besides two or three mascalonge. These bass, Mr. W. said, rose to the fly, and one gallant fellow wrecked the gentleman's trout rod badly. Shortly after that Mr. W. returned to Deer Lake, but not a fish did he take.

Right here it may not be amiss to say that the sportsman who expects inland lake fishing in the Upper Peninsula had better provide himself with a boat. He may occasionally find boats kept for hire, as at Au Train, but generally he must either have his own boat, or put up with a vessel so old and worthless that it is not worth owning.

But let us move along. Three miles east of Onota we come to Rock River, so named because of the numerous and immense rocks lying at its mouth in the lake, and which afford capital fishing in season. Here trout running from two to three pounds are taken. From the railroad crossing to the mouth of the river is almost one mile, and the lower half gives good stream fishing. The evening we went up to Marquette, a couple of elderly gentlemen boarded the train at the Rock River station, who had been stream-fishing below, and each had a nice basket of trout. The top ones weighed not less than three-quarters of a pound; the under ones I did not see, but it would have been in accord with an ancient angler's custom to have had the little ones at the bottom.

Au Train is the next place to be mentioned. The railroad skirts the Au Train Bay for four miles, and at the end of three-quarters of the way, as we go eastward, the Au Train River discharges its waters. The railroad crosses this little river within a sling-stone's throw of the bay, where there is a station. A little over a mile from the river's mouth, as the crow flies, is the Au Train Lake, a reservoir left, doubtless, by the receding waters of the great lake in the remote past; but by the river (which runs through the lake) the distance is all of four miles. The Au Train River, between the two lakes, makes a marvelously big bend, and from this circumstance the name Au Train springs. John Clark, an educated Indian, told me that the name was suggested by the long, sleigh-runner-like bend in the stream. It is French.

Be this as it may, Au Train enjoys quite a celebrity as a camping, hunting and fishing post. A beautiful grove of pine saplings grows on a high level parcel of land a few rods from the station, in the edge of which an enterprising landlord has erected a frame hotel. The wonder is that some vandal has not cut down every sapling of the grove, and one's respect for the place grows in consequence of this uncommon evidence of the existence of a little common sense. The grove actually seems to be cared for, and while campers are permitted to set their tents amid the saplings, chopping them is prohibited.

Au Train Lake is famed as a deer resort during the summer months, and large numbers have been killed here regardless of the law. I have heard some marvelous stories told of deer shooting on this lake. "Tenderfeet," who can't kill deer elsewhere, come to Au Train, and by the aid of a light and a boatman, find it an easy job. I heard one man say that at certain seasons the air was so offensive along the lake shore from the carcasses of slaughtered deer that hunters were often incommoded thereby. No doubt the statement was highly colored, but it was a significant one nevertheless. The fact is, summer shooting on the Au Train has been extensively practiced.

Beyond the lake, within a reasonable walking distance, is the Au Train Falls, which is said to be well worth a visit. Below the falls is good trout fishing.

But let us leave Au Train. A run of fourteen miles, much of which is up grade, brings us to Munising Station, 316 feet above the level of the great lake, and forty miles from Marquette. Here is where one leaves the cars to go and see the Pictured Rocks and get a taste of the lake and stream fishing in their neighborhood. A short distance west of the station the railroad crosses a narrow, rapid, log-filled stream with high banks, known as Anna River, and so named after the first white woman to settle in its near neighborhood. The Anna is no inconsiderable trout stream, but it is so easily reached by the Indians and other Munising people, that one would scarcely expect much success fishing in its waters. Still, if one should from any cause have to stop over at Munising, it would be well to try it; and there are worse places in which to be left than in Munising. Alice lives there, and her cookery is famed the region over. Alice cannot be said to keep a hotel, for her establishment is the veriest shanty, so I can't be charged with writing this as a hotel puff; but if the angler, hunter, camper, traveler, be hungry for a first-class dinner, let him signify the same to Alice, and if she is well enough to undertake it, he will, when he reluctantly turns from her shanty, go away sounding her praise. He will no doubt see old Charley, Alice's husband, hobbling around while there. Old Charley is an oily-looking old gray-beard, and if the guest's wife or daughter is with him, she must not be shocked if old Charley swears a little in her presence; but the apology of Alice, should she hear him—and she generally does—will make all amends. "I am surprised at you, Charley!" she will say, "to think that a gentleman of your excellent sense should swear in the presence of a lady! It is unaccountable!" And turning to the lady she will say, "Really! you must excuse him. He always would swear before ladies, but it is the only fault he has."

The Anna is the last stream flowing into Lake Superior that we cross. Munising is on the comb of the great sandstone roof lying between the two great lakes. The Anna River flows north into Lake Superior, and south of the station less than a mile may be found the headwaters of the West Branch or Stuch's Creek, a tributary of the Manistique. From Munising on, the streams run southward into Lake Michigan until we have passed beyond the Manistique slope.

South and southwest of Munising is an extensive area containing many small lakes, some of which are land-locked, but most are not. All as far as visited have been found to be well stocked with bass, and some with pike and occasionally one with trout, and all are accessible to a determined sportsman with a guide.

About six miles south of Munising a chain of small lakes is met with, leading out into the west branch of the Manistique, or Indian River. An old lumber road leads into the lakes, and boats can be lugged over the portages and the descent of the Indian River be made; but the trip would not be a holiday affair. I talked with one who made the trip as guide, and he told an extravagant story of the trout fishing enjoyed by the party on the way. Mr. William Gunton, a land-looker and lumberman, who has wet his line in nearly every trout stream of importance in that region, assured me that the trout ran larger in the Indian River than in any other stream he had fished. Another year the writer hopes to make his way into the upper waters of the Indian River and settle for himself the question of its trout-bearing qualities. He will carry rod, shotgun and camera. As he descends he will expect the scenery to become quite rugged and picturesque, and around the shores of Indian Lake, a sheet of water covering fifteen or twenty square miles, he will see hills and rocks that will give quite an assortment of photographic views.

But we must go on. It is eight miles to Jeromeville, and there we will go into camp. As we thunder along through a sylvan cañon, a hundred feet in width, with walls as high as the tall, compactly growing trees, the Judge suddenly thrusts his head out of a window, and yells at the top of his voice. His conduct seems so extraordinary that for a moment we think something is wrong with him. Some of the passengers evidently think so too. Listen at that fish-eyed chap who works his jaws languidly over an enormous quid of tobacco. "I say," says he to the Greek Professor, "that 'ere feller's seen a bear or else he has 'em!" But the Greek Professor does not comprehend. He knows when a fish is biting at his hook as well as any man, but what is meant by the Judge "having 'em" passeth his comprehension. He does not understand the language of slang.

"I saw Oscar," said the Judge, as he settled back into his seat.

Now, Oscar is one of the young men who was with the Judge last year in these very woods, and this year Oscar had stopped in the Lower Peninsula. But not long since we got a letter from him, and he wanted to join us, and as he was a good fellow we wrote, "Meet us in Jeromeville." Oscar must be trying to meet us.

Bad news! Bad news! On our arrival at Jeromeville, Louis, a young man belonging to the section boss's family, tells us that "two tileograms had been sint down for the Jidge, one of which said how one of his factories was burnt up, so it was, and the other how some one was sick."

But Mr. Oscar had taken them and was gone no one knew where. We know, however. He is off to meet us with the telegrams—to meet us at Munising. Lucky the Judge happened to look out and make himself known to Oscar. Oscar will soon come back. But in the meantime, how must the Judge feel? He has no factory to burn, but he has a home, and more than that—he has loved ones at home to grow sick. "This is my eleventh year," says he, as he paces up and down the railroad in front of the Jeromeville station, "and never did I receive a word of bad news from home before."

At last Oscar comes and produces the two messages, one states that a certain educational institution (not the Greek Professor's) with which the Judge held some sort of official connection, had been destroyed by fire. This, then, was Louis's "factory," and but for the other message much laughter would Louis's "factory" have occasioned. But, alas! the other: "The doctor says that neither Lillie nor the baby can last long," and the Judge must go. These belong to his household—daughter-in-law and grandchild—and the next train he leaves for home, nearly six hundred miles southward, and I go, too, while the Greek Professor and Oscar stay behind.

When we left we did not expect to return, but we did nevertheless. Poor Lillie! After a valiant struggle for her life she had rapidly declined, and within a few days after our arrival she succumbed to the inevitable, as must we all sooner or later; but the baby recovered and, the grandmother being across the sea, he was put out to nurse. George and Mabel, worn out with watching and care and toil, could ill-endure the depressing heats of the Indiana dog days, and the doctor advised a change of climate, and so the Judge resolved to go back to his camp in the woods and take the tired ones with him, and I returned also.

D. D. BANTA.

THE TENDERFOOT'S FIRST DEER.

THE Tenderfoot had been with us just one week. It was quiet times at the ranch, for the round-ups were over, the winter's wood had been hauled and split, the cattle had drifted with the early November storms toward the South and none remained on the range save here and there bunches of a dozen or more which were trying to rustle through the winter by loafing around the meadow fence or at the corrals and picking up stray morsels which were pitched from the stables, seldom going out on the flats where the feed was good except when they were driven there.

The boys hugged the great box stove in the bunk-house, some busy day after day making quirls, others plaiting rawhide reatas or making hackamores, varying their labors with an occasional game of California Jack or Blue Pete.

Tenderfoot was, in relation to actual experience on a cow ranch, of the tenderfeet a superlative specimen, but he was endowed with a great deal of tact which covered a multitude of harmless errors. He was a man who had had a great deal of experience in both town and country, and had always managed to be at peace with every one, and yet he had the outward appearance of being a man who did not care to have his toes trampled upon without demanding satisfactory explanations. He only looked this as we "sized him up" when he first came among us. He was a modest looking fellow and pleasant spoken, and in the week he had been with us had easily glided into our ways, grown well acquainted and become thoroughly at home. He acknowledged his ignorance of everything connected with his new life, asked questions when he wanted any information in such a way that the boys were all glad to post him or help him, and in the week he was making good quirls and good friends, for the old hands always take kindly to the tenderfoot who gives himself no airs. Nothing they hold in such utter contempt as pretense.

The eighth day came pleasant, and Nervous, who was so nicknamed because he was neither nervous nor fidgety, who had been waiting for the right kind of day, prepared early in the morning for a deer hunt among the canyons below the ranch on the north side of the creek. It was a pleasant morning, though the snow was several inches deep, a twelve-mile breeze blowing from the northwest and the thermometer at least 15° below zero.

Nervous was about ready to start when Tenderfoot asked to accompany him, a request readily granted with the offer to loan him the only spare rifle on the ranch, an old government needle gun. Nervous carried a repeating rifle. Down the creek and across the lower meadow, through the dense boxelder woods covering the flats through which ran the creek, they went, the crisp, frosty snow sounding beneath their tramping feet—well, sounding, eh—eh—well, sounding like the noise made by an awkward man eating hot soup. "Rather too much noise for successful deer hunting," thought and said Nervous, "but as soon as we cross the creek and get into the canyons and commence climbing among the rocks and around the hillsides we will have to move more carefully, but there is not so much snow there and we can get along quietly enough with a little extra care. This wind is a great help to us hunting this direction."

Tenderfoot had never dropped a deer; in fact, had never seen one running wild. He had heard of buck ague, but believed he was in no immediate danger of contracting the disease and, indeed, he looked like a man who could and would keep cool as an iceberg under any deer hunting conditions. He was, and no wonder, anxious to put his nerves to the test to decide which would display the most fear, he or some black-tailed buck.

In the canyons the force of the wind was not felt so much, but above, on top of the ragged bluffs, it played its cool tricks on the loose snow, which it lifted and carried across country or packed away, in every gulch and gully, and dropped on the hunters' heads in showers the frosty flakes. Not a sound but the whistling of the fierce, cold wind, which was evidently trying to keep itself warm by spinning at a twelve-knot gait. It was a cool proceeding but very thin withal. With searching eyes and careful steps they slowly climbed among the hills, now crawling on hands and knees

up almost perpendicular inclines, peering cautiously over them, and then descending feet first on the opposite sides among sage brush and grease wood, across washouts and over pitch-pine logs and wind-battered cedars, that had given up trying to eke out an uncertain living among the rocks. For a couple of miles of the roughest walking and climbing and walking imaginable went Nervous and his companion.

Several jack rabbits had been disturbed from their slumbers behind protecting sage brush, and kicking up little clouds of snow they scampered away with their lives, but bless 'em, they were safe enough this morning. These storm-beaten old canyons are not going to ring with echoes from any rifles pointed at smaller game than blacktails. There was no time consumed for Tenderfoot to admire the scenery, and though he did not say it, he perhaps thought this road was a near relative to Jordan's 'hard road, but he "stayed with it" like a little man, until just as he had slid down six feet from a rock he came in sight of two bucks and a doe not above a hundred yards distant. The doe seemed as though she would like to say—

"How happy could I be with either
Were t'other dear charmer away,"

and both the "dear charmers" were so engrossed in their attentions that they had not seen our friend from the States. No doubt that love is blind.

Quickly turning to Nervous, he told him, and then clapping his rifle to his shoulder, he fired, and one of the bucks dropped and rolled down into a gully, thirty feet below. The others, as much surprised as the mysterious wedding guest was by the Ancient Mariner, started back out of Tenderfoot's sight, but now in full view of Nervous, who made the movements of "turning loose" his repeater, but it refused to "pump."

"Can you see them, Tenderfoot?"

"No, they are out of my sight."

"Well, they have stopped over there, not more than a hundred and fifty yards away. My rifle won't work. Hand me yours."

Tenderfoot could not have got a shot in five minutes, and there was no telling where they would be before he could again sight them; so he handed his rifle over the rock down which he had just slid, and Nervous fired. Down came the second buck, and the doe was just disappearing over a high ridge opposite, when a third time spoke the old-fashioned rifle and the last of the little bunch was done for. She carried the ball about twenty feet, then suddenly dropped it and went with it.

"Tender, I think that will do for a morning hunt, thanks to you for helping me out. Am a little sorry I downed the doe. Now we'll bleed them and go back to the ranch for a team and hang our 'mutton' up a tree."

By following the canyons further down they would have been able to have killed more deer, but present necessities had been bountifully supplied and what was left will furnish work and sport for many another day.

Nervous had placed his shots in the shoulders and Tenderfoot had sent his crushing through the head. In the middle of the afternoon the three were hanging up between the bunk-house and the kitchen. Tenderfoot was complimented on his skill as a rifle shot, but with his usual modesty disclaimed any credit for skill and insisted that he had aimed for the shoulders with a vague idea of hitting somewhere, and his winning shot was nothing but a scratch the likes of which he never expected to repeat.

Could he have had a slight attack of the buck ague? Are not the victims of that disease supposed to make clean misses?

"At any rate," said Nervous, refilling his pipe, "you must know, boys, there ain't any tenderfeet on this ranch."

BEAR CREEK, Wyo.

Natural History.

WOODLAND AND BARREN GROUND CARIBOU.

Editor Forest and Stream:

I notice in the FOREST AND STREAM of February 14, that the editor does not agree with Judge Caton, author of "Antelope and Deer in America," in regard to the woodland being a distinct species from the barren ground caribou.

I have had no personal experience with the latter animal (my information is obtained from those who have hunted it, also from natural histories), but I have always thought that they belonged to separate and distinct species.

The barren ground caribou is one of the smallest of the deer family, and it is seldom that a buck is killed weighing over one hundred pounds. As its name implies, its habitat is the barren grounds between latitude 62° and the Arctic Sea. In winter it seeks the shelter of wooded tracts on the southern boundary of its range. Its favorite food is the mosses and lichens so abundant in that section. This animal is of great value to the Indians and others in the frozen north; they make some use of every part of the body. Large herds of the barren ground caribou roam over the country, and are easily approached and killed.

The woodland caribou, on the other hand, is a larger animal, the doe being equal in size to a barren ground buck, although the horns are smaller and less branching. They frequent the wooded shores of Hudson's Bay, and tracts further south where the other are never seen. A most singular difference in the habits of the two, and one that, with the difference of size, form, etc., surely entitles them to be ranked as separate species, is that the woodland migrates to the southward every spring, while the barren ground caribou is at the same time on its way to the Arctic Sea. The flesh of the woodland caribou is inferior to that of the other.

I hope that the writer of the illustrated article on page 45, issue of Feb. 14, will give his reason for believing that the two animals belong to one species. RED WING.

GLENCOE, Fla.

In most old works on natural history three distinct species of reindeer are mentioned. These are, the old world form, variously called *Cervus tarandus, Tarandus rangifer* and *Rangifer tarandus;* the American woodland form, *Cervus tarandus*, var. *sylvestris*, or *Tarandus caribou;* and the barren ground form, *Cervus tarandus grænlandicus*, or *Cervus tarandus*, var. *arctica*. Since these works were written the views of naturalists have undergone a great change. It was formerly the fashion to make as many species as possible, and to do this it was often necessary to base specific characters on very slight variations—on what would to-day be regarded as nothing more than individual differences. An old world species found in America was often dignified with a new name, for no better reason than that it lived on the other side of the ocean from its already known relative. In those days the tendency was toward the multiplication of species. To-day the current sets the other way, and naturalists generally strive to reduce the number of species to the lowest point.

At present the circumpolar reindeer, whether they inhabit Norway, Siberia, or British America, are regarded as one and the same form, *Rangifer grænlandicus*, while the woodland caribou is thought to be only a fairly well marked race of its more boreal relative. The only known physical characters by which the two forms may be separated are size and horns, and these are not sufficiently well marked to base specific differences on. Size may go for almost nothing. Judge Caton, in his most excellent work on "The Antelope and Deer of North America," acknowledges this, and says:

"The difference in size, if this were the only distinction, would be entitled to but little weight in the consideration of this question, especially when we remember that we often find animals of the same species occupying high latitudes smaller in size than those of warmer countries. The reverse, however, we find generally the case with our *Cervidæ*. * * * I repeat, however, that I should not consider the difference in size, which is fully one-half, sufficient of itself to establish a specific difference." To the diversity in size of the horns Judge Caton attaches somewhat more weight, yet this character we cannot regard as sufficient to establish specific difference. Judge Caton's main reliance in separating the two forms of caribou is on their supposed differences in migratory habit, and on the supposition that the two forms do not interbreed or grade into one another. But as a matter of fact we have very little evidence on these points. We know that in its home—the center of abundance—the barren ground form is small, with large horns, and that in Maine and Lower Canada the woodland form is large, with small horns; but as to the deer, which inhabit the intermediate country, little is known. It is, we think, probable that an extended series of specimens from the country, where the ranges of the two overlap, would furnish individuals of which the naturalist would be unable to say, "This is a barren ground," or "This is a woodland caribou." To decide a question of this kind the acumen of a trained naturalist would be required, and he should have before him a large series of specimens, if possible freshly killed. We recently talked with some old caribou hunters in a region where the woodland form is the only one known, and yet they spoke of two kinds of caribou, which they believed existed there—"the little green woods deer" and "the big hill deer." As a matter of fact they merely referred in the one case to the young and small, and in the other to the old and large deer.

The opinion of the best mammalogists to-day is that the woodland caribou is only a well marked race of the circumpolar reindeer. If any good specific characters can be shown to separate the two, this opinion will be modified, but at present the evidence to justify such a change of sentiment is wanting.

A case somewhat analogous to the one under consideration existed a few years ago in regard to the common Virginia deer, of which several species were named from different sections of the country, but at present these supposed species have no standing, and several of them have none even as races or varieties.

We may mention that our correspondent has the weight of the barren ground caribou much too low. Richardson says a full-grown buck, dressed, will weigh from 90 to 130 pounds. This would give a live weight of from 135 to 200 pounds. There are some other inaccuracies in "Red Wing's" statements, as will be seen by reference to Judge Caton's book.

We cannot do better than to recommend our correspondent to look up this matter for himself, and when he has done so, we fancy that he will agree with us. As we stated in our review of the work, Judge Caton's admirable volume contains a vast amount of information on this and kindred subjects, and it is one that the naturalist and deer hunter can ill afford to be without. THE REVIEWER.

SOME ARIZONA QUAILS.

Editor Forest and Stream:

The "California quail" mentioned by "Nemo" in your issue of the 31st ult. are in all probability Arizona quail (*Lophortyx gambeli*), inasmuch as they are abundant in Southwestern New Mexico and Arizona. The California quail (*Lophortyx californica*) are, on the other hand, I think, rarely or never seen in that or this part of the country.

The Arizona quail is furthermore exceedingly susceptible of domestication. When first caught they are so violently wild as to be almost unapproachable, but by continued and careful attention they eventually become tame enough to handle without fear.

A. G. Buttner, ex-Chief of Police of this city, has a peculiar penchant for pets. About two years since he procured a pair of Arizona quail. They not only became gentle but raised a brood of eleven young ones. Thirteen eggs were laid, but eleven chicks only were hatched. When about half grown they were in part distributed among friends. One of them afterward escaped, and returned to its former home. I secured a pair of them myself and gave them the freedom of a corral in which alfalfa had been sown. They throve finely, but became somewhat shy. When frightened, however, they invariably sought the house for protection. I had previously tried the same course with a pair of blue quail (*Callipepla squamata*), but attempts to domesticate them were in vain. I finally gave them the same freedom that I had given to their kindred, and lost them on the day subsequent.

During the months of September and October the Papogo Pima and Maricopa Indians snare quail by the thousands. They are brought to the market, dozens in a coop. A fancier can, for a few bits, make a fine selection. About two and a half years since, E. L. Wetmore, a well-known resident of this city, purchased a pair of the Arizona variety, and hung them in separate cages on either side of his office door. For the first few days they were frantic with alarm, then finally settled down to the quietness of a humdrum life. He afterward gave them the freedom of a large room and allowed his children to handle them. In due time they not only thoroughly domesticated, but the male became aggressive, and would fly and peck at the hand for food. On two different occasions, sittings of eggs were laid, but no attempt was made to hatch them. The female finally dying, another was procured. She appeared to tame rapidly, but escaped on the first opportunity; was away two days, then returned, and by repeated calls demanded admission to her mate, and never afterward cared to leave him.

To domesticate them, but little care is required, inasmuch as they will eat almost anything that is placed before them. A pan of clean water, plenty of fresh earth, a few sprigs of vegetables (of which there are plenty at all times in this country), a little bread, cracked wheat or seed, and the sum of their luxuries is made up. But, unlike those mentioned by "Nemo," they are, during the warm weather, exceedingly fond of a bath, and when taking it splash the water in all directions, regardless of their surroundings. Those kept by Mr. Buttner raised their little ones in a box not more than four feet square. They had the natural earth for a floor, the sides of the box had been taken off and replaced by wire screen. The nest, made of dry grass thrown in for that purpose, was built under a board that stood slanting from the floor to the end of the cage. If any one cares to try the experiment and will pay the expressage on a pair of Arizona quail which, in my belief, are the most handsome of their kind, I will, as soon as they become plentiful, send them a pair with pleasure. My address is with the FOREST AND STREAM. ADIOS.

TUCSON, Arizona, Feb. 10, 1884.

COLOR OF THE SEA.

A PARAGRAPH has been going the rounds of the newspapers, stating that Dr. J. J. Wild, F. R. G. S., claims that he has discovered the cause of the various colors of the sea, and that they are due to the greater or less proportion of salt held in solution.

How does Dr. Wild account for the fact that large and deep bodies of fresh water exhibit colors similar to those of the ocean?

The waters of the great American lakes, Superior, Huron and Michigan, in their deepest parts, say from 500 to 1,000 feet, are, under certain conditions of sky and atmosphere, of a deep blue color, like those of the Atlantic, Pacific or Indian oceans, the blue, however, is not so intense, the depth of water being much less in these inland seas than in the ocean, some of the deeper portions of which show color like that of a solution of indigo.

In the shallower parts of both salt and fresh water, where the depth is from twenty to fifty feet, various shades of green occur, more or less opaque as the water is turbid or transparent.

I am inclined to believe that the colors of both salt and fresh water depend on similar conditions, some of which are—

1. Depth and transparency.
2. The state of the sky and atmosphere, whether clear or clouded.
3. The course of the wind, north and west winds producing a clear and deep blue, and east or south winds light blue, blue green, or lead color.
4. The point of view of the observer, whether from high land or low.
5. In shallow water, the nature of the bottom, whether covered with rocks, sand, or algæ. S. C. C.

BIRD NOTES.

It was "immense flocks of blackbirds," not "bluebirds" that were seen here flying southwest on the 14th of February (See FOREST AND STREAM of Feb. 28). Crows have been about here all winter. Saw a bluejay yesterday. A few misguided ducks have appeared, but the Raritan River, which was open, is again frozen, and they will probably leave. Saw a robin flying south to-day. Sensible bird. Mercury, 7 yesterday, 14 to-day. J. L. K.

PERTH AMBOY, N. J., March 1, 1884.

The unusually mild, but wet weather, which we have been having this month, has made some of our small birds think of spring. A song sparrow (*M. melodia*) has stayed with us all winter. Two or three days ago, I caught him singing in our lilac hedge, and he seemed very cheerful. This morning the mercury stood at six degrees, and old Boreas had, during the night, taken up a position in the northwest, and was hurling his keenest javelins at daybreak. This very sudden change from bad to worse caused *melodia* to make friends with his cousins, the field sparrow (*S. pusilla*), and slate-colored snowbird (*Junco hyemalis*). All three of them were busy near our porch picking up such crumbs and bits of grain as were exposed in the path which was cleared to the barn. The two last-named species are common winter residents with us, but we do not recollect seeing a song sparrow in either January or February before. Three winters ago, in '80–'81, we saw, in a severe snow storm in January, a single towhee bunting, who appeared lively and well. This was on Scroggy Neck, Sandwich, Mass.

One bluebird, on Washington's Birthday, gladdened us with his sweet but simple song. He flew from one fence post to another, and we watched to see what food he might take; nothing offered to his taste, however, and we left him to his own happy thoughts of spring and sunshine.

MERGUS.

EAST WAREHAM, Mass., Feb. 29, 1884.

Where are the birds? was the question I asked myself many times yesterday, while taking a three hours' walk on the outskirts of the city. I passed rows of evergreen trees more than a mile in length, and thousands of apple trees, but did not see a bird during the whole time. A year ago the same day, going over the same ground, I saw pine grosbeaks, redpoll linnets, snow-buntings, snowbirds, and one song sparrow that had concluded to try a Northern winter; and he seemed to be doing quite well in his home among the evergreens. But yesterday I saw nothing to remind me of birds, unless it was the coarse, bulky nest of the purple grackle in one of the tall evergreen trees by the roadside, and on the opposite side, near the top of a maple, swung the pensile nest of the oriole, and on a horizontal limb of the same tree was saddled the soft, compact nest of the goldfinch. Then, again, in the evergreens the saucer-shaped nest of the mourning dove, and on the framework of a disused lime kiln I saw the well-built moss nest of the phœbe, and on the opposite timber, about twelve feet distant, was the hard, mud-lined nest of *Turdus migratorius*. Further on, in a large thorn tree, was the feather-lined nest of the kingbird, and last and least of all, in a low withewood bush, the thistle-down-made nest of the summer yellowbird; and from the unusual length of it I came to the conclusion that there was something treasured up in the lower department, and on examination I found the egg of the vagabond cow bunting. All these I saw, but not a sign of bird-life until I reached the main business street of the city, where I had a chance to feast my eyes

on hundreds of the detestable, pugnacious little *Passer domesticus*.

I know of but one reason to account for the scarcity of the winter birds in this vicinity. On the 9th and 10th of last September we had a very severe frost that destroyed most of the vegetables and the seed-bearing weeds in the fields, on which the snow-buntings, horned larks, snowbirds and tree sparrows feed during the winter. I have seen snow-buntings but once this winter, Dec. 27, although I was in the fields probably three days in a week up to Jan. 5. Since then I have seen nothing, excepting one downy woodpecker, and he came to the apple tree at my door to show himself.

J. L. D.

Lockport, N. Y., Feb. 11, 1884.

Monday afternoon I counted seven robins in one tree, and they seemed quite contented, although the air was chilly. Redwing blackbirds are around in considerable numbers. I saw four this morning in front of the house. Quail have wintered well so far, notwithstanding the many crusts we have had this winter. I saw a flock of ten black ducks last week heading north, but I guess they did not stay long. Our meadows will be in first-class condition this spring for the ducks, and I anticipate some fair sport. I am in hopes the ducks will make their appearance soon, and I am sure they will if the weather keeps as warm as it is to-day. Bluebirds have been with us all winter. 16-Bore.

Madison, N. J., Feb. 20.

This is a very hard winter for the birds. The English sparrows have almost disappeared; not a dozen now where there were hundreds before. A number of birds have been found dead, and all the birds seen were in poor condition, except a shrike which I shot the other day; he had had an easy time feeding on the sparrows. There are a few chickadees, bluejays and pine grosbeaks, and that is about all around town. A number of Acadian or saw-whet owls have been killed, and I recently secured a Richardson's owl.

W. A. M.

Fort Covington, N. Y., Feb. 18.

The past cold winter does not seem to have much effect upon the migration of birds here.

Feb. 16, bluebirds and robins first seen. Feb. 19, crows were seen flying along the banks of Lake Erie in great numbers. A great many are killed by Cleveland sportsmen as they fly over. They seem to be the main topic of conversation in the gun stores, probably as the first game of the season. Feb. 21, saw four wild geese (*Bernicla canadensis*) flying north. Several flocks reported and a few ducks.

Of the winter birds noted, which may be of interest to the reader, are song sparrows and brown creeper (*C. familiaris*). A pine grosbeak was brought in by a boy who killed it with a stone. It is rare in this vicinity. A few Bohemian waxwings were here in January. I had the good fortune to take a rough-legged hawk (*A. lagopus sancti-johannis*) in black plumage; color, uniform dark brown. Also a fine pigeon hawk (*F. columbarius*), which is quite rare here. Tufted titmouse (*L. bicolor*) is unusually abundant this winter.

A. Hall.

East Rockport.

The first robin appeared here on the 15th of this month, and the bluebirds arrived on the scene the next day. This is at least a month earlier than they generally come into this cold part of the State. N.

Waterville, N. Y., February.

Evening Grosbeaks in Iowa.—Saturday morning, Feb. 8, Mr. J. Painlin, of this place, discovered a flock of unusual and very handsome birds feeding on the seeds of some box-alder trees that grew near his house. His attention was drawn to them by the very musical twittering and chattering that they incessantly kept up, and approaching them carefully he was surprised that they manifested no signs of alarm, even when he stood directly beneath the tree on which they were feeding. Some of the family had seen them there the day previous. The following day (Sunday) the family were absent, but on Monday the birds were still there, and Mr. P. determined, if possible, to secure a specimen or two, but in order to do this he was obliged to drive them some little distance, as the law forbids any shooting within the corporation limits. They flew very swiftly, and, alighting on some trees at sufficient distance, he fortunately secured three (one male and two females). There were but six in the flock—two males and four females. Desiring to have them identified, and knowing my interest in such matters, he brought them to me, and with the help of "Coues' Birds of the Northwest" I found them to be the evening grosbeak. I have never before seen these birds here, and consider myself very fortunate in being enabled to add them to my collection.—Violet S. Williams, Coralville, Ia., Feb. 13.

The Fog Rainbow.—Cosumnes, Cal., Feb. 20.—*Editor Forest and Stream:* Two of your correspondents have lately written of the fog rainbow as a very unusual experience. I myself never had seen one when I came to this State, and was disposed to doubt that there was such a thing. Here in the Sacramento Valley, however, in the winter or rainy season, we sometimes have fog for days together, and I have quite a number of times seen the white bow, having no prismatic colors, and on two occasions a bow having all the colors of the rainbow; never, however, making a complete circle, as spoken of by one of your correspondents.—W. L. W.

Do Buffalo Mate With Domestic Cattle?—Some ten years ago a gentleman living some miles west of here, while on a hunting excursion in Kansas, purchased and brought here with him a buffalo calf. It has been on his premises ever since and is now a large fine cow. It has never bred. No bull could be induced to mate with it. Is this characteristic of these animals or have hybrids been produced?—K. (Vinton, Iowa). [Hybrids have been produced between the buffalo and domestic cattle. Audubon gives at length experiments conducted long ago in Kentucky, and we believe that there is now, near Winnipeg, a herd of crossbreeds.]

Contributions to the Literature of Snakes.—We have received from Mr. James Simson a pamphlet containing a number of interesting letters contributed by him to *Land and Water* at a time when the question, "Do snakes swallow their young?" was being hotly debated. This question has been decided in the affirmative, which was the side taken by Mr. Simson. The letters are charmingly written, and show careful study of the subject.

Ortyx Virginianus in Arizona.—Mr. J. D. Andrews brought in a pair of genuine Bob White quail, to-day. The bird is an extremely rare one in Arizona. The breast plumage of the male is of a darker brown than that of the eastern variety, otherwise the general appearance of the bird is much the same, although if anything it is smaller in size. Those brought in were killed in the Barboquivari range, about sixty miles southwest of Tuscon. On the Gulf of California they are found in great numbers, but the mountains and mesas southwest of Tuscon are believed to be their northeastern limit.—*Tuscon Weekly Citizen.*

Snow White Opossums.—Mr. H. G. Dulog writes from the Hot Springs, Ark., concerning two white opossums—perfectly white all over—yet not albinoes, for their eyes were not pink, but looked dark, even black. The negro owner told our correspondent that their eyes were blue, "same color as yo' eyes."

Transactions of the Linnean Society.—The second volume of the Transactions is in press, and will probably appear in May next.

Camp Fire Flickerings.

"That reminds me."

105.

Among the many good stories related in Forest and Stream I think the following deserves a place. It was told to me by Mr. George W. Leavitt, the well-known cocker spaniel man of Boston, who vouches for its truth:

"About eight years ago I took a trip to Maine, partly for business partly for pleasure, taking with me an English setter that had been recommended as a great ruffed grouse dog. I was at my old home, Pembroke, and one day on telling my uncle, Mr. Pomeroy, that I was going over to Machias on business, he suggested driving me over that I might have an opportunity to display the good qualities of my dog, and also to get some birds, so off we started with dog and guns, and after getting into the woods where the birds were plenty, I turned the dog loose and away he bounded. At almost the first jump he routed a brood of birds, and dashed through them like a wild calf through a flock of turkeys, showing the speed of a lighting express as he bounded through the underbrush, and in an instant was lost to sight. We had waited five minutes, perhaps, though it seemed an hour, when my uncle, with a sly twinkle in his eye, said: 'Nice dog, that, when do you expect him back?'

"'Oh, he is a trifle wild now, but will soon settle down to close work.'

"We turned back toward the road, thinking the dog might swing round that way, and when we came in sight of the horse saw the famous setter lying under the wagon. There was nothing for me to say, so, maintaining a discreet silence, we drove on and soon met two boys, who had nine birds. One of them had an antiquated gun of about twenty pounds weight and ten feet in length—the regular grandfather musket type—but it was death to the birds, and that was all I cared for, as I always have better luck gunning when the boys have been out a few hours ahead of me.

"'How much will you take for those birds?'

"'They are worth seven cents apiece over at Calais.'

"'Give them the dog for a brace,' suggested Mr. Pomeroy.

"'I will give you fifteen cents apiece for the lot.'

"'All right, you may have them, and there is another fellow ahead of us with some more that you can buy if you want to,' said the boys.

"We found the other boy, bought his birds, and went on our way rejoicing, with seventeen nice, plump partridges. We soon reached Machias, and while I was out on business Mr. Pomeroy remained at the hotel. In the meantime Mr. Morgan, a would-be sportsman from our town, drove up. He had with him his two-hundred-dollar gun, explaining that he hoped to see some birds on his way over. Mr. Pomeroy, bent on mischief, went up to him and said, 'Did you get any birds, Mr. Morgan?'

"'No; I saw some, but could not get near enough to shoot them.'

"'Well, I am sorry,' said my uncle, 'but if you had had Leavitt's dog you could have filled your wagon with birds. He beats all the dogs in America. We only had a few minutes on our way over and got seventeen fine partridges. I wish I was a man of means, I would never allow Leavitt to take that dog back to Boston.'

"Mr. Morgan saw the birds and dog, and was so delighted with both that he asked Mr. Pomeroy if he thought the dog could be bought at any price.

"'I don't know; perhaps, as Leavitt has several more, he migh be induced to sell this one for a hundred, reserving the right to breed to him, also to shoot over him when down this way. If you really want the dog I will try to influence Leavitt to sell, for I would like to keep the dog in this part of the country, he is such a rare one.'

"When I came back my uncle told me of the conversation with Morgan. I tried to discourage the scheme; but Mr. Pomeroy was bound Morgan should have the dog, so when Mr. Morgan came to me I sold the dog and got the money. Then came Mr. Pomeroy's turn to explain the great necessity of knowing how to work the dog; he said, 'You must drive slowly until the dog puts his nose in the air, and wags his tail, then get out, tie your horse, and you will be sure to find the birds somewhere.

"'When you get all ready, just say *charge* to the dog and he will make a charge for the woods, then you must follow, that is one of the secrets of working him successfully. You must keep up.'"

"'How shall I know that he has a bird?' asked Mr. Morgan.

"'Don't look at the dog but keep an eye on his tail, and when it becomes stiff you may be sure he has a bird charmed so thoroughly that you could knock it over with a stick. No bird can move while that dog's tail is stiff.'

"Mr. Morgan felt sure he could work the dog, so started early in order to get a few hours' shooting before dark. Not long after we started for home and had driven about eight miles when, to our intense surprise, we saw the poor dog lying dead by the roadside. We got out to examine him, and found he had been shot, so buried him and went our way. We soon met our boys of the morning, with a fine lot of birds, which we of course bought. While I was paying for them, the boys said, 'We ought to ask you more for these, for John Morgan offered us twenty cents a piece for them a little while ago, but we told him we had sold you seventeen in the morning and shot these for you since, and would not go back on you anyhow.'

"I began to tremble, but Mr. Pomeroy laughed and said, 'What did Morgan say to you then?'

"'He did not say a word, and I think he must be crazy,' said one of the boys, for he jumped out of his wagon, tied his horse to a tree, grabbed his gun, and shot the dog dead; but when I told him it was mean to kill the dog, and I wished that I had taken him in the morning, when Mr. Pomeroy offered him to me for a couple of birds, he roared out something about State's prison, and drove off.'

"When we got home, I tried in every way to make Morgan take his money back, but his grit was thoroughly aroused, and he refused to take a single cent. I then set things up for the crowd, and we had a jolly good time. Morgan at first refused to join us, but finally thought better of it, concluding no doubt that there is no loss without some small gain." Mont Clare.

Claremont, N. H.

Game Bag and Gun.

NEW ENGLAND GAME LAWS.

The bill to amend the Massachusetts law is now with the Committee on Agriculture.

The question of putting the power to license taxidermists in Massachusetts into the hands of the game commissioners, has, by common consent, been attached to the question of uniform game laws, and the committee on agriculture are evidently pleased with the idea. The destruction of song and insectivorous birds for their skins has become a serious question in the minds of the more intelligent of the agricultural community. It has been noticed with alarm that the annual return of certain of the best of New England song birds is beginning to be looked for in vain in many sections of Massachusetts, and the numerous taxidermists, with their boy followers, are likely to be held responsible for the loss of these charms of country life.

At the hearing it appeared that the inhabitants of the deer section on Cape Cod desire no change in the deer law from that making a perpetual close time, as enacted two years ago. Concerning this matter the friends of a uniform code of game laws were not strenuous, and accordingly no change in regard to the deer law in that direction will be asked for. The deer in the State are all confined to a narrow strip on Cape Cod, and any part of an open season would, it is believed, at present result in their utter extermination. The dwellers on the Cape desire that the close time be retained absolute till such time as the deer shall have increased sufficiently, when they will come to the Legislature and ask for an open season.

Several riders are likely to be proposed along with the uniform game law bill. One came up before the Committee on Agriculture. It proposes that any owner of lands or a park under twenty-five acres in extent, shall be protected by law in Massachusetts from the encroachment of gunners on such lands, provided he shall sufficiently post such land with notices forbidding such trespass. The friends of fish and game protection will not oppose such legislation, for they believe in respecting the rights of land-holders, and that by such means the former can be more thoroughly linked with the protection of game. The right would thus be given him to protect the game on his own land. The old proposition to give the farmers' boys the right to snare and sell partridges and quail out of season was, of course, introduced, and the attempt to tack it on as a rider will be made, but probably without success. M.

Boston, Mass., March 3.

OUR DETROIT LETTER.

Just at present the recently organized Michigan Gun Club and Game Protective Society could accomplish a deal of good by stopping the illegal sale of quail by dealers, and the serving of the same in hotels and restaurants in Detroit. It is said that they are sold daily by a Woodward avenue dealer, while nearly every restaurant in town will serve them at a moment's notice.

It would surprise a certain surly, fault-finding chop-house keeper that I know of, very much indeed to be pulled up with a round turn. Indeed, it makes me shudder to imagine his apoplectic wrath were he called to account. For, being an Englishmen of that unhappy class who belittle this country and its inhabitants, albeit they depend on both for subsistence, he would surely nearly explode with rage if called to account for purchasing quail out of season. And several persons I know of would enjoy the scene. For our chop-house keeper denounces America and things American with the utmost impartiality, and only a few months since bitterly berated the sportsmen of this blasted country as a set of lawless, ruthless slaughterers of game, "hand werry much beneath hour Henglish gents who 'ave fine feelinks, hand hin hevery land carefully protect the game, hand respect the laws." When he delivered that special tirade against his adopted land and people, a bystander ventured to suggest that pheasant shooting in England, as so often described, was not very pretty sport; and also called his attention to the wanton slaughter of game by Englishmen upon our Western prairies, whereupon our chop-house keeper became purple and speechless with anger.

By no means let it be inferred that I am unfriendly to our English cousins, for I am not. On the contrary, some English and Irish gentlemen with whom I have shot, fished, and coursed, are among my warmest friends. And the country of Thackeray, Lamb, Goldsmith, Ruskin, and other favorite writers is very dear to me.

But confound a low-bred person, be he Yankee, English man or Irishman, who, in a foreign country, continually berates and belittles the people upon whom he depends for subsistence.

The gun club referred to above held their first regular shoot upon Washington's Birthday. The weather was horrible, snow, rain, and wind each striving for the mastery, but as will be seen from the score, the attendance was large. The club will, from appearances, be a success as a gun club; it remains to be seen how it will develop as a game protective society. It can, as an association, do valuable service to the good cause, for private individuals dread making complaints against law-breakers.

A week since the ducks began dropping in the Detroit River, but the cold snap came, and now all is ice again.

Detroit sportsmen will be glad to learn that Mr. A. O. S. Havens has secured the fine store No. 72 Woodward avenue,

and will open it about March 1, with a fine line of guns, fishing tackle, etc. Mr. Havens has made himself very popular indeed during his residence in Detroit, and in his new location, which is a fine one, he will no doubt do a large business. DELTA.

DETROIT, Feb. 23.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

In an editorial note Feb. 21 you truly say that the comparison of muzzleloaders and the breechloaders is a dead issue, but a comparison of the shooting qualities of the two guns will certainly bring about just the discussion you suggest—"the relation of experiments and tests in loading to secure pattern and penetration."

My experience in hunting, shooting and experimenting runs back for thirty-five years. It has been with all kinds of guns, from the old Continental flint-lock musket to the best breechloaders of the day. I now own three breechloaders made by myself for the especial purpose of experimenting. One is a single barrel 3-bore, weight 11 pounds, in which I use one-inch Gatling-gun brass shells; no paper shell large enough are made. One is a single 10-bore, 14 pounds, and the third a 20-bore, 11 pounds. I design conducting a series of experiments some time this spring and will give you the results. With all my practical experience I do not claim to be authority, but what I have to say are my own convictions, based on the results of many practical tests, and simply give them as such.

The old saying "as straight as a gun barrel" certainly had no reference to very many of our modern double breechloaders, for not one in ten has straight barrels. I refer to the inside bore. This is especially true as to the cheaper grades, and I am sorry to say that many of the better grades have the same fault. In order to get the required strength for the breech action as well as to stand heavy charges, breechloading barrels must be very heavy at the breech end. This necessitates considerable taper in the barrels, or the guns would be very heavy. Nearly all the taper is in the first half of the barrels from the breech end. Very much of the beauty of a gun depends on the graceful sheer given to the taper. In joining at the factory the barrels are sprung together in the center, in order to have the ribs fit properly, as well as to give the gun a graceful appearance, hence the bore of the barrels are not straight. However, twelve to fifteen inches of the muzzle-ends are practically straight, and parallel with the line of sight. It often occurs in the cheaper grades that the barrels are sprung so much in the center that the muzzle ends diverge to the right and left. In such guns the right barrel shoots to the right and the left one to the left. Guns with the barrels tapered down very thin at the muzzle, as a general rule, are better shooters than those with thick ones. A majority of chokebored guns are too heavy at the muzzle, which accounts for their grouping the shot in bunches and leaving many bare spots in the targets. In very thin guns there is a certain amount of expansion and elasticity, which has the effect to overcome the tendency to group the shot, hence give quite an even distribution.

It can be put down as an axiom that guns having the straightest barrels, other things being equal, will give the best results.

The next consideration that has much to do with the good and bad shooting is the quality and quantity of the ammunition. There can be no denying the fact that a good quality of ammunition is better than a poor quality; but as to quantity, opinions differ greatly. From some unaccountable cause, there appears to be a general opinion that breechloaders require very much more powder than the old-styled muzzleloaders, when as a matter of fact guns properly chambered and properly charged require less. In well-constructed breechloaders there are absolutely no escaping gases unless the plunger cuts through the primer. In muzzleloaders it quite often occurs that sufficient gas escapes at the nipples to throw the hammers back to a full cock. In guns of ordinary weight, 8 pounds to 8½ pounds, I would not advise 5 drams of powder to 1¼ ounces shot, nor would I think of 1 dram of powder to 13 buckshot. The proportion of powder to shot that gives the best general results will be found to be 3 drams of powder to 1 ounce of shot. On page 546 of "Haswell" will be found proportions of powder to shot for the following numbers of shot, as determined by experiment:

No.	Shot, oz.	Powder, drams.	No.	Shot, oz.	Powder, drams.	No.	Shot, oz.	Powder, drams.
2	2	1.5	4	1.5	1⅞	6	1.25	2⅜
3	1.75	1.625	5	1.375	2⅛	7	1.125	2⅝

NOTE.—2 ounces of No. 2 shot with 1.5 drams of powder produced the greatest effect. The increase of powder for the greater number of pellets is in consequence of the increased friction of their projection.

With American engineers Haswell is good authority. How few men from actual knowledge could dispute the results as he has given them; I could not do it for I have never experimented with 2 ounces of shot to 1¼ drams of powder. Ogeecher's 1 dram of powder to 13 buck shot is about according to Haswell. Killing a buck at the distance of 120 yards with such a charge caps the climax. Put me down as a little skeptical. Whoever sticks to the proportion of 3 drams of powder to 1 ounce of shot will be satisfied with the results.
